The most basic problem is the lack of a clear definition of metatheorizing. Because of it, we have what appears a series of isolated works, isolated sub areas within types of metatheorizing, and isolated types of metatheorizing. Metatheorists often feel defensive about what they are doing because they lack a clearly defined intellectual base from which to respond to the critics. Thus what stand out are the criticisms that often go unanswered. (Ritzer, 1990, p. 11)

In a search of the literature, Mark Edwards (with some support from the present author) found over 20 definitions of metatheory. While this search was not comprehensive, we believe that we have identified a good cross section of the field. One of the first things I noticed in reviewing these definitions is that the authors seemed to be describing different things. While some were describing the broader field of metatheory, others were describing related, yet subordinate, areas of metatheory such as the evaluation or categorization of metatheory. In this section, I will provide an overview of the field, based on the discovered definitions.

Broadly, metatheorizing is the process of performing metatheoretical research. That process includes many different kinds of activities including sorting theories and/or sorting their components into categories (Wallace, 1992, p. 53), the use of reflexivity (Ritzer, 2009), deconstruction and reconstruction (Ritzer, 1992, p. 11), statistical analyses of the literature (Meehl, 1992), and nearly 20 other suggestions (Turner, 1991). Just as theorizing results in the creation of theory, metatheorizing results in a "metatheorum" which is a statement about theory in general or a statement about a specific theory (Wikipedia, 2009).

Abrams and Hogg (2004) take an alternative, primarily metaphorical, approach to describing metatheory. They suggest, for example, that a metatheory makes a good travel guide. Sklair (1988, p. 697) describes a metatheorum as reflecting the coherence between epistemology and objects of knowledge. This coherence extends to include a set of assumptions about the constituent parts of the world, and our possibility of knowing them. Overton (2007, p. 155), in contrast, says that metatheorems define the context in which the theories are made, and refer to the theories, themselves. He also goes on to say that a metatheory is a set of interlocking principles that describe what is acceptable and unacceptable for theory.

Broadly, the field of metatheory includes the study of the "sources and assumptions; and contexts" (Finfgeld, 2003, p. 895), including the study of theorists and communities of theorists (Ritzer, 1988, p. 188), the process of theorizing (Zhao, 2010), and the analysis of the methods, findings, and conclusions of the research (Bondas & Hall, 2007, p. 115) the use of those theories (Bonsu, 1998, August) as well as their implications (Turner, 1990). Finally, the prescription that metatheorizing should produce theories that are open to empirical testing (Sklair, 1988).

Although they all address the same general theme, these definitions of metatheory contain more differences than similarities. Such disparity makes it difficult to draw useful conclusions about any shared definition of metatheorizing or metatheorems. Also, these descriptions are most often very sketchy and fragmentary; indeed, they are almost entirely "atomistic." That is to say, most authors simply created a list of concepts that they considered important to the study of metatheory (e.g., metatheory is A, B, C, & D). Such an approach may be expected given the relative youth of the field. In contrast, more mature fields tend to contain concepts that are more closely integrated (e.g., A causes B and C, or A, B, & C are co-causal).

As the reader may notice, this broad range of definitions of metatheory overlaps with other areas of study. That overlap may cause confusion and concern (as well as the opportunity for additional investigation and clarification). For the present article, however, I will focus on what might be considered the core of metatheory – without which, none of the other parts would be possible. This analysis begins by identifying the area of greatest agreement between the many definitions of metatheory.

Table 1. Aspects of metatheory as described by various authors

Author/s	Date	Analysis of theories	Is (or creates) a theory of theory	Integrates multiple theories	Analysis of assumptions	Makes implicit assumptions explicit	Analysis of underlying structure	Analysis of structure of theory	Deconstructive
Finfgeld	2003	x			x				
Bondas & Hall	2007	x							
Dervin	1999					x			x
Anchin	2008			x					
Sklair	1988								
Faust	2005	x							
Clarke	2008				x				
Fuchs	1991						x		
Weinstein & Weinstein	1991	x							
Zhao	2004	x							
Craig	2009		x						
Takla & Pape	1985				x				
Thorne, et al.	2004								
Paterson, et al.	2001	x							
Ritzer	1988	x		x					x
Gadomski	2001		x						
Wikipedia	2009		x						
Turner	1990							x	
Faust & Meehl	2002	x							
Bonsu	1998	x							
Colomy	1991	x							

In Table 1 I list the authors of 21 definitions of metatheory and their key ideas. The more complete definitions are listed in the appendix. From this arrangement of the data, a few important conclusions may be drawn. There are also contradictions, which may prove troubling or prove to be a source of new insight.

First, and most simply, metatheory is focused on the analysis of theories. Ten of our 21 authors specifically agree on this point. In contrast to this general agreement around the core of metatheory, few authors describe metatheory as the analysis of context. Therefore, we may reasonably conclude that studies of theory are at the core of metatheory, while other studies (e.g., contexts, groups of theorists, methods, applications, etc) are less so. Second, it may be noted that six of our authors describe metatheory as making implicit assumptions explicit (Dervin, 1999), analysis of assumptions (Clarke, 2010; Finfgeld, 2003; Takla & Pape, 1985), analysis of underlying structure (Fuchs, 1991), and the analysis of structure (Turner, 1990). These are essentially deconstructive approaches (Dervin, 1999).

In contrast to this deconstructive approach, metatheory may also be understood to integrate multiple theories (Anchin, 2008b; Ritzer, 1988). The two approaches may be inseparable as one cannot combine integrate two theories without also integrating the assumptions, structures, and concepts of those theories. In short, metatheory (as the study of theory) may be conducted in at least two ways. It may be integrative (where multiple theories are combined). It may be deconstructive (where theories are parsed into their constituent components for analysis and/or recombination). Either way, the process leads to the creation of a metatheory, metatheorum, or “a theory of theory” (Craig, 2009; Gadomski, 2001; Wikipedia, 2009).

To summarize, the field of metatheory is richer and more complex than is expressed by any single definition to date. The following definition strives for conciseness, rather than completeness as the main focus of this article is the development of metatheory as a science. So, this definition (a simple, though useful, prelude) suggests that:

> Metatheory is primarily the study of theory, including the development of overarching combinations of theory, as well as the development and application of theorems for analysis that reveal underlying assumptions about theory and theorizing.

This definition, it should be emphasized, reflects the state of understanding of metatheory to date. And, as noted above, this level of understanding has not proved sufficient for advancing theory or metatheory – perhaps because the terms are too fuzzy. In the process of creating this definition, however, a potentially clarifying co-causal relationship begins to emerge. Here, the analysis, evaluation, and integration of theory leads to the development of new methods of evaluation, which may then be used to evaluate the results. Far from a useless tautology, this suggests a path for the development of some conceptual constructs through the development of other conceptual constructs. By explicating this developmental process we may accelerate the development of such constructs. This occurs in much the same way that one may use a map to more easily locate a store for buying maps. Or, the way one may use telecommunication to collaborate on the creation of more effective telecommunication systems. These are positive feedback loops, rather than useless tautologies.

In the above section, I have briefly summarized the field of metatheory. However, a larger question lurks. It is generally understood that the reason for metatheory is the development of better theory. Indeed, many or all of the same “rules” that apply to the development of theory also apply to the development of metatheory. Because the two areas share a common heritage, they may also share a common failing. Who is to say, for example, that our failure to make effective theory will not be replicated – leading to our failure to make effective metatheory? To avoid this trap, we must take metatheory to another level.

Where the creation of theory is understood to occur within a specific field of study, we might take a different view of metatheory and investigate metatheory as a field unto itself. However if the field of metatheory is to have any some degree of respect and usefulness, it must be understood as a legitimate science. As a science, we can expect metatheory to make advances and develop insights that may be applied to theories across the sciences. In the next section, I will investigate the idea of metatheory as a science from a modernist perspective.

Towards a Scientific Metatheory

Many voices have called for the advancement of social theory (e.g., Dubin, 1978; Leong, 1985; Popper, 2002; Van de Ven, 2007). To date, however, the methods for the scientific study and advancement of theory have been ineffective. For example, Meehl reports on 11 known methods for advancing theory (Meehl, 2002). However, he finds them to be primarily intuitive – and so unsuited for scientific investigation. Indeed, a recent study by HERA concluded that there was no method of evaluation that could be counted on to work effectively (Dolan, 2007).

To achieve greater effectiveness, we must reduce the epistemological indeterminacy around metatheory – we must learn to represent more clearly our knowledge about the similarities and differences between metatheories. In this, the ideas presented in this paper support the many excellent suggestions of Tom Murray (2006).

In this section, and the following sections, we will investigate how we might study theory and metatheory as a science unto itself. An important expectation is that following scientific methods will enable the creation of effective metatheory, effective theory, and more effective methods and practices. There are many understandings of what science is. So, in order to develop a deep and nuanced view, I will investigate the science of metatheory from multiple perspectives. In this section, I will investigate scientific metatheory from the modernist perspective. In the following sections, I will investigate scientific metatheory from a postmodern perspective. Then, I will discuss a combined perspective of a scientific metatheory.

To frame a modernist perspective of science, I begin with a recent and concise definition where, “Science is the pursuit of knowledge and understanding of the natural and social world following a systematic methodology based on evidence” (Science Council, 2010); which includes:

A. Objective observation: Measurement and data (possibly although not necessarily using mathematics as a tool)
B. Evidence
C. Experiment and/or observation as benchmarks for testing hypotheses
D. Induction: reasoning to establish general rules or conclusions drawn from facts or examples
E. Repetition
F. Critical analysis
G. Verification and testing: critical exposure to scrutiny, peer review and assessment

In this section, I will briefly review what is to have a modernist science, and explain how those standards may be applied to metatheory.

A – Objective Observation

Observation includes the description (and often measurement) of subjective, objective, and relational experience. Yet, in the social sciences, where two people might observe the same phenomena and arrive at dissimilar conclusions, the idea of objective observations becomes problematic. Because "There are no facts independent of our theories" (Skinner, 1985, p. 10) and "no observation may be totally theory-free" (Hull, 1988, p. 492) and, "no two scientists are ever in total agreement with each another" (Hull, 1988, p. 493). This situation has made advancements in the social sciences incredibly difficult and led to the fragmentation of many (perhaps all) fields of study.

In a post-positivist approach, with its attendant assumptions of uncertainty, there are great benefits associated with triangulation – combining multiple views to create a more effective understanding of our lived world (Rousseau, Manning, & Denyer, 2008, p. 486-487). Within a post-positivist world, there is little room for so-called "objectivity." Yet, the word still caries weight. And, in the present paper, it may be understood as representing an approximately repeatable experience within a context of metatheoretical investigation. That is to say, if two researchers of similar education undertake an investigation of the same theories using the same research methods, they should reach the same result. The extent to which their results are similar is the extent to which the approach may be considered objective.

In contrast to the more general range of social sciences, the field of metatheory has an advantage in this aspect because metatheory is a primarily hermeneutic approach where, "Hermeneutics is the interpretation of texts" (Bentz & Shapiro, 1998, p. 170). Thus, we metatheoreticians have access to books and journals that are (at least for a time) stable. That means, where many social events come and go in the blink of an eye, forcing researchers and their human subjects to rely on memory, we have the opportunity to revisit the texts with all the care and patience needed to fully understand the authors. In short, we are less subject to the transience of our observed subjects. Another benefit to the metatheoretical approach is completeness. That is, we have the possibility to analyze entire "worlds," where other social scientists must make do with a small fraction. For example, if we wanted to create a metatheory based on all the works of Durkheim, we could (conceivably) collect and analyze his complete writings. In contrast, a social scientist who wanted to develop a new theory of child development could never observe all the children in the world.

In the scientific process of metatheory, the subject of analysis is primarily theory. The process of investigating theory, in part, involves the process of deconstructing existing theories (Dervin, 1999). Importantly, we can share those texts with other scholars to determine if we share the same viewpoints. That means we can begin to develop some degree of objectivity based on the similarity between our observations and interpretations of texts. In short, in the study of metatheory, we have the opportunity to be a more effective science than most fields of social theory because (in the area of objective observation) we suffer fewer effects of transience, easier opportunity for completeness, and greater opportunity for objectivity.

It is critical, however, to note that the opportunity to achieve these aims is not enough to make metatheory into a science. We must show through our work that our efforts have reduced transience, increased completeness, and increased objectivity. That, in turn, suggests that our metatheoretical analyses should include a large percentage of the available writings in a given area of study to exemplify completeness. Similarly our analyses should be collaborative efforts to exemplify objectivity.

B – Evidence

The collection of evidence is an important part of any scientific endeavor. Specifically, this refers to evidence that may be used to support (or contradict) one's theory (or metatheory, in our field of study). Without the anchor of recorded evidence, the metatheorists may be accused of blue-sky speculation. Because this evidence consists of theories, the collection process may be fairly simple. One needs only collect the theories and hold them against the requirement of future reference. Evidence should also be identified and saved on the "next level" of analysis. For example, if a metatheorist has collected a number of theories and enumerated what percentage of those theories were actually tested, that too is evidence. And, the responsible scientist should keep that evidence available in case there is a challenge to the theory and a need to "show your work."

As noted above, in the pursuit of metatheory, that evidence will come from the analysis of other theories. The evidence may be theories, the propositions within theories, or other data that is directly related to the theories. While Ritzer (1992) seems to suggests that metatheory should be focused on analyzing theories of the "middle range," that seems to present an unnecessary limitation on the field of metatheory. There is no a priori reason why metatheory should not include the analysis of theories on all subjects – from subatomic particles through galaxies, including psychological, social, and economic theories along the way. Of course, in investigating such a range of theory it is important that the metatheorist identify some form of similarity. For example, causal and co-causal propositions are found in theories of the natural and social sciences (Wallis, 2009c).

Whether the evidence is collected from a broad range across disciplines and sciences, or the evidence is collected within a very narrow field of study, an important question remains as to how much evidence is enough? This is an opportunity for future investigation and clarification. The tacitly accepted practice seems to be that one has enough evidence when one is able to successfully convince others of the validity of one's model. Yet, this is a weak standard as some people may be convinced with little evidence while others will not be convinced if they face all the evidence in the world. This concern leads to the need for testing.

C - Experiment and/or Observation as Benchmarks for Testing Hypotheses

Within the field of metatheory, two intertwined branches are emerging. One branch is primarily concerned with the creation of overarching theories, while the other branch is concerned with developing and applying rigorous and repeatable tests to theory. This is an important distinction to surface at the time because the hypotheses derived from each branch will be tested differently.

Metatheory Testing

Van de Ven (2007, p. 137) reflects on what might be the most common point of view for theory appraisal. Drawing on Weick and Thorngate, Van de Ven agrees that the creation of each theory requires a tradeoff between simplicity, generality, and accuracy. For example, a theory might be made more accurate, but that would require the theory to become more complex. This approach has led many theorists to claim that their theories are valid because they are parsimonious (Meehl, 2002). This is like claiming that something is good because it is tall – without a relative measure, the claim has no value.

By far, the strongest argument for testing theories comes from Popper (2002). Popper argues with strength and conviction that the only effective way to test a theory is to falsify that theory in practice. That view is, of course, itself a form of theory. And, importantly, has not been falsified. Adopting a metatheoretical perspective (see Wallis, 2008b), I noted how Popper was the product of a modern age. So, his search for modernistic "objective" knowledge seems to have blinded him to other forms of knowledge. By reframing Popper's own ideas, I suggested three paths for the validation and falsification of theory.

In the "world of facts," or data, a metatheory must (at the very least) be constructed of data – explicitly drawn from existing theory. A better metatheory would use data from multiple sources. The best metatheory is one where the theory may be applied to predict what future data will emerge. In the "world of meaning," the metatheory must (at a minimum) make sense to the author. A better metatheory would make sense to the editor, reviewers and readers. At the highest level, a theory is accepted in a consensus of expert opinions and that theory is preferred over other theory of the same domain. Finally, in the "world of theory," a metatheory must (at the very least) include logical arguments. A better theory is one that is constructed of specific propositions. And, the best metatheory is one that is constructed of carefully integrated, co-causal, propositions. The tests within any one of these worlds is certainly of limited efficacy. However, when combined, they create a potent standard for the evaluation of theory and metatheory.

A common argument for advancing the validity of a theory or metatheory is the claim that it "works" in practice. However, by itself, that is a weak claim because anything can be said to work. The deeper question become whether one theory or metatheory (and its derived hypotheses) works better than any other. For example, imagine an experiment where one prays for rain using a variety of techniques and direct those prayers to a variety of deities. I imagine that the results of such an experiment would not show much difference in rainfall. For another example, one might claim that the very popular management change process of Total Quality Management (TQM) is a valid theory because it is widely used, generally accepted, and seemingly successful. However, a more critical analysis find that the TQM fails more than 70% of the time (MacIntosh & MacLean, 1999). The more effective theory, or metatheory, is the one that can be shown to work better than another when applied within a specific context.

Rigorous evaluations should also be applied to those tests, and to the understanding of the context. It is not sufficient, for example, to claim that all theories are acceptable in some context and all theories exist in some context, so all theories are valid (a useless, non-generative, tautology). So, to conclude this section, it seems that we have the opportunity to identify, clarify, formalize, and apply rigorous methods for testing theory and metatheory.

Theory Bounding

An additional approach related to theory building is the idea of theory "bounding." It is an essentially metatheoretical process to delineate the boundary of a theory. Generally, a theory is bounded by additional explanation of where that theory may be legitimately applied – sometimes called the "limiting values" (Hitt & Smith, 2005). For example, a scholar might make a theory about team development. And, because the research was based in the telecom industry, that theory might be bounded by a statement such as, "This theory only applies to teams working in the telecom industry."[2]

In bounding the science of metatheory, we can say that our realm of study is theory. Further, the theorems that apply to the realm of theory, as a whole, are the theorems that are most central to the science. It is possible, of course, to subdivide the field of study. One might, for example, develop theorems that apply only to theories of sociology, or theories of health care. Such approaches, while they may drill-in to greater depth within a specific area of study (e.g., theories of sociology), are also less central to the science of metatheory, itself.

A legitimate science must be bounded in terms of subject matter. Further, the theory developed through the study of that subject matter might only be legitimately applied to that subject matter. For example, one cannot study galaxies and expect the resultant theories to work very well when used to choose a color for bedroom curtains. This simple idea brings with it some powerful conclusions. For example, if one is attempting to develop a "theory of everything" (TOE) the implication is that one must study everything. The impossibility of this requirement suggests the impossibility of developing a legitimate TOE. It is certainly possible to develop a generalizable abstraction – where a theory developed in the study of one organization may be legitimately applied to another organization. It seems less likely that one can studying a drop of water, develop a theory, and apply that theory to understand human development. Where exactly one draws the line is a matter for continued investigation.

D - Induction

An important part of science is the building of theory. And, in the field of metatheory, the building of metatheory (Craig, 2009; Gadomski, 2001; Wikipedia, 2009). As with the creation of theory, the process of metatheory creation is essentially one of induction – where a metatheoretician identifies related propositions within two or more theories and integrates them to generate an overarching metatheory or derive a rule for the analysis of future theories. By way of context, the inductive process begins with an abductive experience, "a surprising observation or experience. This is what shatters our habit and motivates us to create a hypothesis that might resolve the anomaly" (Van de Ven, 2007, p. 101). Also, the inductive process may be seen in contrast to the deductive process, which is related to the testing of theory.

---

[2] Yet, in theories of physics, we see no such bounding. For example, Ohm's I=E/R relates to volts, amps, and ohms of resistance. Those are the aspects of the theory, and they do not apply to other things such as color or emotion. Therefore, it seems to make more sense to suggest that a theory is self-bounding – based on its constituent propositions.

Drawing on Weick, Van de Ven suggests that from the myriad hypotheses, one might find the best theory by subjecting those hypotheses to a variety of thought-trials. "The greater the number of diverse criteria applied to a conjecture, the higher the probability that those conjectures which are selected will result in good theory" (Van de Ven, 2007, p. 109). While his approach may also prove useful, it also has a fatal flaw. Because, if one uses ten criteria, nine of them might be useless. In such a situation, the other nine that are not causally related to theory-improvement would overrule the one criterion that might result in a better theory. This is the same kind of problem faced by most people during an election campaign. One receives a flood of information, yet little of it has any true bearing on the qualifications of the candidates! Instead of developing a list of criteria, Van de Ven rests on the bench of "plausibility" Thus returning to a more or less intuitive form of evaluation. He extends that idea to link plausibility with conjectures that might be interesting to readers such as problems in society that need to be explained. This "appeal to the audience" is not a strong argument. Indeed, instead of leading to good theory, such an approach might lead authors to invent problems so that they may write persuasively to "explain" those problems and create supposedly "good" theories and metatheories.

This might be good literature but it is not good science – from the modernist perspective. And, as a result, the suggestion does not rise to the level of good metatheory. At this stage, however, there may be no way to avoid the rather abductive nature of the process. Instead, that moment where we think to ourselves – "That doesn't make sense!" – is the moment when we begin a sense-making process. With careful effort, we find that something makes sense that did not before. This is part of making implicit assumptions explicit; an important part of metatheory (Dervin, 1999).

As the evidence of theory is collected, combined, analyzed, and insights begin to emerge, the results begin to resemble the integration of multiple theories – an important part of metatheory (Anchin, 2008b; Ritzer, 1988). Some tools of theory building include:

- Intuition
- Observation
- Abstraction
- Creating propositions
- Defining key terms
- Describing the domain of application
- Identifying the units of analysis
- Sampling some appropriate and relevant set of theories
- Analyzing the "data" using rigorous research methods
- Identifying core constructs and their interrelationships

In a detailed review of the *Handbook of Sociological Theory,* Treviño (2003, pp. 284-286) notes several forms of theory construction including: Jasso's suggestion to engage in voracious reading and use of mathematics, Carley's creation of computer simulations, Joas and Becket's synthesis of existing theory, Turner and Boyns' consolidation of theory within a grand analytical scheme, Bailey's reduction in detail to focus on concepts, Lopreato's call to discover general principles, and Lindenberg's method of decreasing abstraction. From a complexity theory based approach, Ostroff and Bowen (2000) encourage theorists to note the degree of stability and change that occurs at each level under analysis. Also, Morgeson and Hofmann (1999) provide guidelines for theory-creation. Their process involves delineating the structure, function, and outputs of a given system. However, this view of an organizational system seems to be more descriptive than theoretical and Dubin (1978, p. 12) notes that theory is not merely describing, categorizing, or stating a hypothesis).

Sussman and Sussman (2001, pp. 90-92) claim that the golden rule of theory development is to make one's hunches explicit by writing them down. This, they contend, also includes an assumption that the reader will be able to see more easily whether the theory is likely to be effective, and show who will benefit. To facilitate this process, they suggest four criteria for theory building (that may also be used for theory testing).

1. The theory should be plausible – it should make sense.
2. There must be enough variables within the theory so that the theory is useable.
3. The theory should be testable.
4. There should be a heuristic value to the theory – it should be useable across multiple situations.

The rules that apply to theory building also apply to metatheory building because each metatheory is also a theory – albeit one whose domain is understood as the study of theory. Importantly, combining, and integrating, multiple theories is an inherently metatheoretical process. Some call the results theory, while others call the results metatheory. However, because all theories are built from previous theories (or, a combination of existing theories and new data), and no difference has been shown in application between social theory and social metatheory, the two may be considered synonymous. This indicates an important area of study for the field of metatheory. Because, if it can be proven in application that metatheories are more effective than theories the social sciences, as a whole, will have taken a giant leap forward.

The existing state of metatheory building is, unfortunately, impoverished in regards to suggestions for building theory. One important source of information on how to perform metatheory building comes from the literature on the construction of middle-range theory. For example, Mintzberg (2005, pp. 361-371) encourages theory builders to use their intuition and to "be brave." This might, conceivably, lead to brave theories, but there is no way to test the bravery of a theory (or the theorist). Nor is there any suggestion that a brave theory might be more effective in practice. Therefore, the theorist should be very wary about accepting advice that leads to untestable theories. For those theories cannot be tested cannot be improved. The same advice applies to metatheoreticians.

When building metatheory, the data used comes from the analysis of extant theory. Metatheoreticians investigate existing theory and extract or acquire insights from that set of theories. For example, one may look at a set of theories and perhaps categorize them (e.g., complex or simple) and abductively identify a categorical rule (e.g., parsimonious theories are easier to test and complex theories cover more ground). From what might be called a "content metatheory" perspective, one may look at a set of theories – each containing a different set of concepts. One might conclude that all valid theories must include some (or all, depending on the rule) of that set of concepts. Van de Ven (2007) suggests that the process of abstraction, when correctly applied, can increase the generality of a theory (because a more abstract theory can be applied across a broader range of situations). Abstraction also makes it possible for a theory to become less complex while increasing accuracy.

While most suggestions for theory building are "one-shot" bits of advice (e.g., be creative), a more complex and rigorous approach is to transparently follow a particular methodology. One such methodology, designed specifically for metatheory is Reflexive Dimensional Analysis (RDA). RDA was derived from grounded theory, as well as dimensional analysis (Wallis, 2006a, p. 7). Because it involves constructing new theory from the combination of existing theories, RDA is essentially a metatheoretical process. RDA proceeds according to the following steps:

1. Define a body of theory.
2. Investigate the literature to identify the concepts that define it.
3. Code the concepts to identify relevant components.
4. Clump the components into mutually exclusive categories.
5. Define each category as a dimension.
6. Investigate those dimensions through the literature, looking for robust relationships.

Examples of this form of theory construction may be found in benchmark studies of complexity theory (Wallis, 2009a), complex adaptive systems theory (Wallis, 2006a, 2006b). Another approach that deserves some attention is the process of Grounded Theory (GT). GT is a rigorous process of theory creation (Glaser, 2002) representing a structured methodology for theory creation with good potential for use in the creation of metatheory. Importantly, GT could provide a clear link between the data (theory, in our field) and the resulting metatheory by moving the data through a set process (Goulding, 2002) that can be summed up as:

1. Coding the data
2. Thematizing the data
3. Finding relationships between the themes

Grounded theory suggests the use of an "open coding" process. There, the researcher intuitively codes the data. In that sense, the first step might be seen as an a priori one. In contrast, in the process of thematizing the data, the research is to look at the coded data and identify common categories for grouping them. This process might be seen as essentially a posteriori in the sense that the researcher begins with data, and then identifies a relationship. Similarly, the third step of finding relationships between the themes suggests an a posteriori approach – albeit one that calls for more creativity and abduction.

The iterative interactions between research and data, as well as developing relationships between the themes suggests a generative approach that is reminiscent of the mélange of social construction. Also, each step of the process is documented for transparency. However, with grounded theory, the process is surfaced for clarification. One of many examples may be seen in the development of a complex (yet useful) integrated strategic planning framework for dynamic industries using Grounded Theory (Tsai, Chiang, & Valentine, 2003). It has yet to be shown if either grounded theory or RDA might be repeatable. Although, it seems that both methods seem like they would have a higher level of repeatability than (for example) intuitive methods of theory building.

To summarize the more general conversation on the construction of metatheory, it seems that metatheory has offered little that is new in terms of theory building. Our field has adopted calls for triangulation (framing this as the use of multiple theoretical lenses). Authors with a focus on metatheory have echoed calls for techniques such as imagination and discipline. And, they have (to a small extent) formalized existing approaches to theory building. This lack of rigorous methodology may account for some criticism of metatheory. Similarly, for the process of building metatheory, I have only seen scholars use the same tools as have been used for building theory. Therefore, in looking at metatheory, theorists are able to see and criticize in our work what they do not see in their own. That is, a lack of methodological rigor. This lack of rigor may be exemplified as the lack of repeatability in the process of theory creation.[3]

It may be impossible to develop repeatable experiments for theory creation because the origins of theory seem shrouded in the mists of imagination. Who is to say exactly where Newton's ideas for laws of motion arose? In this, I do not refer to some apocryphal apple, rather the formal mathematical relationships. The inspirations and ideas are lost in moments long past. In the study of the creation of metatheory, on the other hand, explicit theories and metatheories remain for study. This may indicate a more fruitful direction for the advancement of a scientific field of metatheory – which will be explored in the following sections.

E - Repetition

Repeatability has long been a mainstay of science. For a negative example, about twenty years ago, two physicists claimed that they had achieved nuclear fusion at room temperature (instead of the millions of degrees of temperature required by generally accepted theories of physics). They shared their news with the world, and many scientists eagerly repeated their experiment. However, the same results were not forthcoming. This attempt at repetition allowed the world to quickly determine what worked and what did not.

Innovation, as with theorizing, is also important to the process of metatheorizing. Used by itself, however, it may take on the appearance of blue-sky speculation. In a science, we balance the trend toward speculation by applying the more rigorous standard of repetition. Applying the process of repetition to scientific metatheory, we might expect (from a modernist perspective) that two scholars who begin with the same source data and apply the same techniques for metatheory building, while working to address the same topics, should develop the same metatheory. However, to the best of my knowledge, this kind of study has never been attempted. This lack of repeatable studies suggests a great opportunity for metatheoretical study.

---

[3] Dubin notes that the process of theory construction may be inescapable as man creates models of the sensory world then uses those models to comprehend the world. Or, put another way, a theorist is one who observes part of the world and seeks to find order (Dubin, 1978, p. 5-6). While it may be inescapable, that does not mean it is hopeless or useless. For example, we cannot negate gravity, but we can use it to our advantage (e.g., downhill skiing, accelerating space probes through a "slingshot effect," enjoying the benefits of rainfall, and more).

For example, a teacher or researcher could conduct a classroom exercise by providing a set of theories to three (or more) groups of students – with the assignment that each group should develop a set of metatheoretical insights based on the data set. The results should prove interesting – and highly stimulating to the science of metatheory. It may be expected that each group of students might employ a different methodology – and perhaps have different aims in their exercise. One group might simply combine all the theories to create one large (and amorphous) theory. Another group might identify similarities of structure between the theories, while a third group identifies new insights based on what the existing theories did not cover. In short, without some guide, it is unlikely that there will be repeatability in the science of metatheory.

In light of the difficulty of obtaining repeatable results in the creation of theory, it may be more useful to develop formal tools for the analysis of theory. These should be rigorous so as to enable repeatability. This is not, in any way, to restrict the imagination and creativity of the metatheoreticians (which, fortunately, is rather irrepressible). Instead, this is to channel that creativity to where it might be more usefully applied to advancing the science[4]. In short, in order to have repeatability, we must have the rigorous methodology of critical analysis.

F – Critical Analysis

Where the tree of metatheory is beginning to blossom is in the area of critical analysis. The idea that theories may be evaluated seems to instill some with a sense of dread (Fiske & Shweder, 1986, p. 2); as if any method for evaluation must somehow be arbitrary. Yet, it is important that we evaluate theory to ascertain if it is, indeed, a valid theory. And, those methods of analysis need not be arbitrary. Without some form of objective evaluation, we are left with a situation of complete relativism which renders everything meaningless (D. T. Campbell, 1983, p. 124).

The analysis of theory is an inherently metatheoretical exercise – as in Ritzer's M_u (Ritzer, 2001, p. 18) and occurs more frequently than most imagine. For example, every academic paper involves the implicit and/or explicit examination of extant theories, a consideration of which theories (or parts of theories) might be suitable for advancing a new theory or research project. What is being coalesced and clarified here is a set of evaluative methodologies that might be called metatheorems because they are useful for conducting metatheoretical analysis. This, of course, is rather different from the kind of "metatheories" that would be understood as overarching a range of theories and/or disciplines. Both of these, of course, are different from "metatheory" as the entire field of metatheoretical endeavor.

---

[4] Imagine a poet who is using a word processor. Each time she types a word; the computer inters a random word in its place. Can poetry be made this way? No – the very process of creativity requires reliable tools. During the scientific revolution, each scientist had his own theory – a very creative situation. Today, each person still has the opportunity to have his or her own theory. Yet, there is one prevailing (perhaps dominating) set of laws for electricity. While some might see those laws as infringing on more creative interpretations, I would suggest that those laws enable creative work in the design of electronic devices such as cell phones and computers. And, in turn, those devices enhance creativity, art, and communication in myriad ways.

To the extent that the metatheoretical methodologies described in this paper are fuzzier, they will be less useful to the development of metatheory as a science. To the extent that they are more rigorous and repeatable, they will bring the field of metatheory closer to the status of a science. In this, one may conduct fuzzy metatheory and be legitimately accused of conducting bad science. However, before the accusation may be considered valid, we must have reliable, repeatable, critical methods of analysis. In this section, I will present a number of methods as a way of starting a conversation that will allow us to keep criticism in its appropriate place.

Within the study of metatheory, there is broad agreement that the analysis of theories is an important part of metatheory (Bondas & Hall, 2007; Bonsu, 1998, August; Colomy, 1991; Faust, 2005; Faust & Meehl, 2002; Finfgeld, 2003; Paterson, Thorne, Canam, & Jillings, 2001; Ritzer, 1988; Weinstein & Weinstein, 1991; Zhao, 2010). Indeed, given the breadth of that agreement, critical analysis be considered central to the field of metatheory.

In his recent book, Edwards (2010, pp. 206-214) applies an impressive array of tests that may be applied to metatheories. Derived from Ritzer and others, these include:

- Nesting – ensuring that the metatheory is grounded in theory.
- Linkage – identifying and describing relationships between conceptual elements of theories.
- Comparative Techniques – qualitative comparisons and calibrations between theories under analysis.
- Conservation – integrating theories without supplanting them completely.
- Uniqueness – does the metatheory provide something new?
- Parsimony – keeping to the minimum number of explanatory factors needed.
- Generalizability – what other areas of research might the metatheory be applied?
- Level of Abstraction – how many variables and theories might be integrated?
- Internal Consistency – how relevant are the lenses of the metatheory to one another?
- New Factors – can a new theory, or lens, be identified?
- Relationships Between Factors – have the theoretical lenses been carefully identified, and linked and have the internal facets of each lens also been identified?
- Credibility – is the underlying logic reasonable?

Advancing these methods to the point where they may be applied with objective, repeatable rigor will be a boon to the science of metatheory. Among the more objective methodologies developed for the critical analysis and evaluation of theories are:

- Complexity – as a measure of parsimony (Ross & Glock-Grueneich, 2008).
- Static Robustness – as a measure of the internal integrity of a theory (Wallis, 2008a).
- Dynamic Robustness – measuring the stability of a theory as it moves between scholars (Wallis, 2009b).

It is important to note that while these essentially metatheoretical methods have been applied to the analysis of theories, they have not been applied to the analysis of metatheories. So, again, the field of metatheory could benefit greatly from continued investigation along these lines. In the following sub sections, I will briefly describe a number of other methods that may prove useful to the metatheorist.

Categorization

One approach for conducting metatheoretical analysis is categorization. This is a fairly simple method for conducting metatheoretical analysis, which aids in the process of generating metatheory. One way of looking at the processes of metatheorising is to combine the models of Ritzer (2001) and Colomy (1991) which categorize metatheoretical activity based on the aims of the researcher. This gives us four categories of metatheorising: (a) reviewing the theories within some domain, (b) preparing to create middle-range theory, (c) creating an overarching metatheory and (d) determining the strengths and weaknesses of other theories and metatheories.

Another method is suggested by Gregor (2006, p. 620). Her five interrelated types of theory are distinguished as: (a) theory for analyzing, (b) theory for explaining, (c) theory for predicting, (d) theory for explaining and predicting, and (e) theory for design and action.

Kaplan (1964) suggests six forms of structure for theoretical models. His forms of structure include a literary style (with an unfolding plot), academic style (exhibiting some attempt to be precise), eristic style (specific propositions and proofs), symbolic style (mathematical), postulational style (chains of logical derivation), and the formal style. This last, the formal style avoids “reference to any specific empirical content” to focus instead on, “the pattern of relationships.”

It is also possible to categorize theory in a number of other ways. For example, one might create a category based on some specific context (historical, geographical, etc). Similarly, one might also describe a history of theory, identify schools of thought, or identify geographical differences (e.g., European and African) in the origin or use of theory. Each of these methods, and many others, may provide useful to scholars. Categorization, however, does not necessarily require a deep engagement with the theories under analysis (although, of course, it might). For example, one might engage in a metatheoretical categorization of existing theories by the date those theories were published. In such an approach, one need never look at the theory at all. Therefore, while it may be useful in some context, categorization may not be central to the field of metatheory.

General Norms of Validation

Kaplan (1964, pp. 311-322) discusses the validation of theories in terms of three types of norms (correspondence, coherence, and pragmatics).

Norms of correspondence. "Truth itself is plainly useless as a criterion for the acceptance of a theory." Indeed, an appeal to facts rests on a bedrock of common sense; yet, those presuppositions also stand in the way of scientific advance, "and progress has required the courage to thrust them aside." "What counts in the validation of a theory, so far as fitting the facts is concerned, is the convergence of the data brought to bear upon it, the concatenation of the evidence - beautifully illustrated, to my mind, in Ernst Jone's essay on Symbolism."

Norms of coherence. This norm suggests that new theories must be fit into the existing body of theory. In this area, Kaplan discusses the simplicity of a theory, and the need to assess that theory in comparison to other theories. Essentially asking which is the best theory to use for a particular situation.

Pragmatic norms. This norm asks if the theory seems to work in practical application. Interestingly, he also notes, "From this standpoint, the value of a theory lies not only in the answers if gives but also in the new questions it raises."

For each of these three norms, Kaplan notes strengths and weakness - essentially suggesting that no one norm by itself is sufficient for judging the efficacy of a theory. These three norms may be understood as general categories for other forms of analysis.

Maturity

Another approach to critical evaluation suggests that a more effective model might be understood to be one that is more mature. (Commons, Trudeau, Stein, Richards, & Krause, 1998) develop innovative and useful insights into the structure of theoretical models. They accomplish this by drawing a parallel between the less-understood development of models and the better-understood development of individuals, organizations and cultures. In each area, the system that is understood as more evolved is the system that is more complex. In their maturation model of theory, the stages are:

1. Abstract Stage (stories become cases, events are abstracted to data).
2. Formal Stage (two or more Abstract Stage variables are related).
3. Systematic Stage (developing simple hypotheses from Formal Stage relationships).
4. Metasystematic Stage (creating models that account for all relevant relationships).

Importantly, in this maturation model, the “Systematic Stage” is one where there is a formal description of how variables interact in relation to one another. This stage requires “multiple input variables” and may suggest multiple outputs as well. This view stands in contrast to less complex (and so less mature) models that suggest simple, linear, causality. Creating a parallel between complexity and some sense of maturity seems to have validity – and is reflected across a broad section of literature.

Strong Actuarial Thesis

Yet another approach (or set of approaches) is suggested by the Faust-Meehl “strong actuarial thesis” which surfaces the difficulty of evaluating theories and asks, “What features of theories predict their long-term survival?” and, “To what extent are those features similar across disciplines and domains?” (Faust & Meehl, 2002, p. S186). Usefully, Meehl (1992, pp. 408-426) examines many forms of theory evaluation and describes the weaknesses of each (empirical studies, ceteris paribus, simplest explanation, aesthetic beauty, logical possibility, unconnected postulates, reducibility, etc). And (Meehl, 1992, p. 438), suggests that logical-mathematical theories are more true/accurate/useful than explanatory theories.

Causal Structure

Stinchcombe (1987) suggests another form of analysis. Specifically, he investigates the causal structure between the concepts within a theory. These methods provide useful guidelines for graphically mapping the structure of a theory. Among his interesting insights, he explains how to critically analyze a theory to remove useless aspects – thus rendering the theory simpler, with little or no loss of explanatory power. For an abstract example, consider a theory that describes causal relationships between three observable things. Changes in A cause changes in B that cause changes in C. This theory has three concepts connected by two linkages. If we are using this theory to understand the end result "C," Than the intermediary "B" is extraneous. The theory might just as well say that, A causes C.

Propositional Analysis

A theory or metatheory may be understood as an "ordered set of assertions" (Southerland, 1975, p. 9). Yet, this begs the question of how well ordered these assertions actually are. One answer to this problem is seen in the use of propositional analysis (Wallis, 2008a) which appears to be the most rigorous method for analyzing a body of theory. This multi-step process begins by finding the propositions within the body of theory. Those propositions are then compared with one another to identify overlaps, and redundant concepts are dropped. Next, the propositions are investigated for conceptual relatedness. Those aspects that are causal in nature are linked with aspects of the theory that are resultant. Those concepts that are explained by or resultant from two or more other concepts are considered to be "concatenated."

Concatenated aspects are privileged because they are better explained than others – to the extent that the better understanding is transcendent. Bateson (1979) describes how two eyes are better than one because the two views combined also provide the viewer with depth perception – something neither eye alone could achieve. Similarly, it is generally accepted that when two people combine their views on a single topic, a new and more comprehensive view emerges. Or, from a metatheoretical perspective, two lenses of theory are better than one.

The formal "robustness" of the theory is then determined by dividing the number of concatenated aspects by the total number of aspects to provide a number between zero and one. A value of zero represents a theory with no robustness – as might be found in a bullet point list of concepts. A theory with a value of one suggests a tightly structured theory, such as Newton's F=ma. For an abstract example, lets say we have a theory consisting of the following propositions: A is true; B is true; A causes B; Changes in B cause changes in C; Changes in D and changes in C cause changes in E. There are five aspects (A, B, C, D, and E). Of those five, only E is concatenated (D and C cause E). This gives a ratio of well-integrated aspects to poorly integrated aspects of 0.20 (the result of one divided by five).

This represents an important advance in the critical evaluation of theory for at least three reasons. First, because it provides an alternative logic for understanding theories. Second, because it provides a method for objectively delineating the structure of a theory. And, third, because progress in advancing theory toward a measurably higher level of structure seems to be related to advancing a theory toward revolutionary improvement in theory and practice (Wallis, 2009c).

Litmus Test

In conversations, some scholars have reported to me that they apply a “litmus test” to theories and metatheories as a way to determine validity. For example, one might say, “Any theory that purports to promote freedom is a good theory.” While this appears to be a laudable goal, it is a weak scientific standard – primarily because it must fall back on other theories and other interpretations. It begs all sorts of questions such as, “What does it mean to promote?” or, “What is freedom?” and, “Freedom for whom? Or “Freedom for how long?” Further, it leaves unanswered questions about the actual efficacy of the theory or metatheory. A problem highlighted in the phrase, “freedom is slavery” (Orwell, 1949, p. 7). In short, simple litmus tests do not seem to be good science. They are essentially an act of faith or intuition.

When theorists and metatheorists resort to litmus tests or intuition in place of rigorous, repeatable, analysis, it may be because the more rigorous methods are not well understood, or there may be a cultural bias against their acceptance. Whatever the reasons for past analyses, our science would benefit from the continued development, articulation, and application of these methods in analyses of theories and metatheories, alike. These methods need to be developed both individually, and in comparison with one another. One pioneer in this area is the late Paul Meehl. Meehl found that parsimony is the most used, and most problematic of the claims for the validity of a theory (Meehl, 2002). More frequently used, though less specifically cited, is the test of “logic”(e.g., Wacker, 1998). This test is so common that it has faded into the background. It is simply assumed that each theory has some logic to it.

Indeed, it may be said that a theory is constructed of logical arguments (e.g., Gregor, 2006). And, that logic may be accepted as a routine test for theories undergoing peer review. However, that approach has proved insufficient to the task of advancing theory. Possibly because there is no clear demarcation for what Set of logical arguments is better than another. That is to say, the logical arguments need only be “good enough” (whatever is appropriate for the needs of the journal). One problem with logic is that it is often constructed in “chains” (A is true because of B, B is true because of C, etc) (Steiner, 1988). Steiner concludes that the last link of a chain remains undefined. So, although one may claim validity based on acceptable logic for a theory, there often lurks the unspoken method of intuition.

Meehl (1992, p. 358) notes that there are few or no metatheoretical rules of what he calls “universal form.” Therefore, metatheorists have nothing to guide them but their intuition. And, studies have shown intuition to be unreliable (Meehl, 1992, p. 370). Meehl (2002) also argues at some length against intuitive methods of evaluation because intuition has been shown to be a weak tool for evaluation – even among experts working within their own field.

To conclude this section on forms of critical analysis, we should note that some of these forms might be more useful than others, depending on the needs of the metatheoretician. For example, if one is conducting a historical analysis of theory, the process of categorization might be more useful. If one is comparing theories to determine which might be best applied in practice, one may be better off choosing propositional analysis. There is a great opportunity for investigating these forms of analysis. They could, and should, be tested and compared with one another to identify the efficacy of each approach in various fields of study and for various purposes. Given the range of tools presented in this section for the metatheoretical analysis of theory, it should be apparent to the reader that she or he need not rely on weak tests of logic, litmus, or intuition for evaluating theory or metatheory.

G – Verification and Testing

It is absolutely imperative for the advancement of any science that the work be exposed to scrutiny; including peer review and assessment. Without the dissemination, comparison, and testing of theories and metatheories, one may become a lone hermit, talking to one's self and digging one's self deeper into some self-satisfying view of the world. It is much better for the science if we develop more useful, shared, understandings. Some metatheoretical models may be held and even used subconsciously – used, but never detected or explicated. In order for the theory to make sense to others, the theorist must surface tacit mental models for explanation and publication.

As analysts, we escape the trap of our own assumptions by making our theory and methodology explicit (Scheff, 1997, p. 142). Without that clarity, we incur at least two problems. First, we may be overwhelmed by data. Second, we are less able to perceive what is new or different. By having data, we might know *what* but not *why*. We become trapped by seemingly inescapable facts. With theory, we transcend – we gain a new perspective and are able to take action. This is the importance of metatheory – that starting assumption that we may understand the world (and ourselves) in a different way – that we may become more than we are. Following this path, we may more easily gain the ability to change our world and to change ourselves.

In *Cultures of Inquiry*, John Hall (1999) describes a "third path" of inquiry that is primarily neither objective nor subjective, rather is essentially reflexive where meaning is created in a socially constructed sense. Similarly, Ofori-Dankwa and Julian (2001) work to identify a bridge from the traditional notions of theory building, and novel, paradoxical approaches that reflect complexity and chaos theory. Where an individual metatheorists might build a metatheory from one of these, or another of many approaches, those approaches are still rooted in the individual – however carefully contemplative and reflexive that individual might be. In a science of metatheory, another level of reflection is gained by exposing a metatheory to social evaluation.

In the following section, I will investigate the arguments for a postmodern approach to science, review a range of postmodern approaches to scientific inquiry, and investigate how these approaches might be applied to the study of metatheory.

From Modern to Postmodern

Kitcher (1993, p. 7) notes how "there is no theory-neutral body of evidence to which scientific theories must conform." This, theory-laden nature of (so-called) facts is reflected in the study of metatheory. That is to say, there is no metatheory-neutral body of theory. Each of us has a set of assumptions (a.k.a. models, mental models, schema) that shape the way we understand and engage. The same applies to the way we engage theory (and metatheory). This view appears to hold true for modern and postmodern approaches. Historically, “The postmodern period follows the supposed triumph of science and rationality, calls into question, and produces an array of diverse and divergent conceptions of knowledge” (Bentz & Shapiro, 1998, p. 1).

To understand something, one approach of modernist science is to idealize it. That is to say, to assume that everything behaves in a certain way. Applied to humans, one might assume that “all humans are rational decision makers.” These kinds of assumptions may be useful in that they allow the researcher to have a set assumption upon which to build additional work. One problem with this approach is that those assumptions are always illusory. There is no way to be completely objective – to understand some absolute truth, because there are always assumptions.

There is no real way to avoid this. Modernist science tried very hard by differentiating scientific inquiry form political, artistic, and religious inquiry. As a result of those reductionist assumptions, fantastic advances were made. As another result, we are starting to see some of the weaknesses of those assumptions – including the weakness of reductionist thinking, itself. Kitcher (1993) engages this conversation at great length and depth. And, he concludes, that we should not attempt to rid ourselves of modernist science. Rather, we should seek to change it – to enrich it. One way to do that is to integrate modernist science with postmodern insights into the value of religion, art, human interaction, creativity, and values.

Objective truth does not seem to exist. And, if it does, we humans do not have access to it. What we do have is the ability to access multiple ways of understanding. We can sit in the presence of a person, we can admire the beauty of a work of art, and we can revel in the novelty of surprising insights. If we attempt to engage the world with a single method, we become guilty of methodolatry. To avoid this trap, “scholars have urged researchers to put aside their theoretical silos to uncover the potential of using interdisciplinary theoretical perspectives in research.” Using, “border-crossing notion of bricolage,” combines multiple methods as appropriate to the research context (Abes, 2009). This brings to mind Bateson’s “double description” (Bateson, 1979). His essential idea is that we may reasonably ignore concerns for objectivity or ultimate reality and pragmatically accept that two descriptions of something are better than one.

Modernist approaches to science tend to seek an absolute truth about the nature of reality. This totalizing view discounts alternative views, approaches, and ways of knowing. Thus, modernist science serves as a point of view – a metatheory that both enables and restricts how a user of that view approaches the world and investigations of the world.

Postmodernism, on the other hand, stands in contrast to this monolithic view. Lyotard (1984), for example, suggests that it makes more sense to see society as a range of dualities and oppositions, rather than some undifferentiated whole. For Lyotard’s postmodern view, science is about the process of conversation, not some pile of knowledge. Similarly, Shotter and Tsoukas (2007) decry the absolutist position and argue for its replacement with approaches that are intuitive and contextual. Calás and Smircich (2005), for example, question the faulty logic of modern knowledge and suggest a range of new logics to support research that will foster change and emancipation.

Broadly, postmodernism suggests multiple paths for investigation and ways of knowing. There is not a single storehouse of well-ordered knowledge. Rather, “Knowledges are incomplete and disordered” (Law, 2010, p. 8). Therefore, it is useful to recognize that knowledge is always situated in a particular context. And, recognizing that there are multiple ways of knowing, we should learn to tolerate the differences between them so that we can explore those differences, rather than attempt to privilege one over the other. Deetz (1996, p. 191) seems to agree – exhorting readers to “Fight the tendency to reduce conceptions to categories or reduce sensitizing concepts to definitions.” There are difficulties and dangers in categorization because that which reveals also conceals.

Specifically, Chia (2005) notes some contrasts between modern and postmodern approaches. Modernism emphasizes differentiation, simple-location, classification, and representation. And, in contrast, postmodernism is more about process, movement, interpretation, and change. The imperatives for postmodernity, he argues, are: (a) Change – that might be understood through history; (b) Workability or usefulness of a theory; (c) Attention to surprise – seeking what is not there and appreciating accidents and novelty.

From another postmodern approach, Law (2009) talks about performativity – how we can enact realities. Generally, he suggests that good postmodern research includes: (a) Looking at our practices - what is being done and how it is being done, (b) Avoiding the assumption that there is an absolute reality beyond what we experience, (c) Asking about how processes turn representations into “windows on the world” (d) There is no way to escape from practice, (e) Look for gaps between practices and realities.

However, postmodern inquiry is not entirely about practice. For example, Rosenau notes how, “For these [skeptical] post-modernists, theory is reduced in stature, but they neither reject it altogether nor call for an absolute equality of all theories” (Rosenau, 1992, p. 22). Which is a fortunate because if postmodernism did not recognize the legitimacy of theory, there would be no opportunity to write about postmodernity (as every form of writing is a form of theory as well as a form of practice). Shotter and Tsoukas (2007) similarly decry the absolutist position that science should replace our intuitive understanding of a situation. Instead, they suggest that reflective conversation within a specific context (rich in description) and everyday use of language should be applied. However, their description of the process seems remarkably like the process of induction - as such talk may lead easily to theories and practices. So, again, we find ourselves back in the realm of theory.

There are (appropriately) a wide variety of postmodern approaches to inquiry and so science. The following table provides a distillation of some approaches by a dozen authors. From this, I hope the reader will gain an appreciation of the vast range of possibilities for postmodern scientific exploration. And, I hope, be encouraged to develop more approaches.

Table 2. Aspects of postmodernity as defined by various authors

Author/s	Year	Anything goes	Avoid categorization & definition	Avoid Ontological arrogance	Deconstruction (includes undercutting privileged texts)	Contextual nature of knowledge	Narrative	Hermeneutic	Paradox	Complexity	Uncertainty / unpredictability / ambiguity	Change	Critical	Reflexive	Interpretation	Introspection	Artistic	Intuition	Humanistic	Awareness of human condition	Emancipation – Who benefits - Justice	Values	Naturalistic / Feminist / NeoMarxist	Educative	Action-Research	Praxis-oriented / Experimentation (usefulness)	Phenomenological	Observe & communicate with others	Practical / Workable	Constructivist	Develop underlying rules for understanding
Rosenau	1992	X			X		X								X	X													X		
Deetz	1996		X																												
Critchley	2001							X																							
Argyris	2005																								X						
Murray	2006								X	X	X																				
Lyotard	1984							X					X	X								X									
Smith	1999				X			X					X		X						X		X	X	X	X	X			X	
Kofman	2010			X																											
Chia	2005										X	X						X		X						X					
Law	2010					X				X	X															X					
Bentz & Shapiro	1998							X							X	X										X		X			X
Kitcher	1993																X		X									X			

From a postmodern perspective, as you may infer from the above table, there are more than a few ways to conduct scientific inquiry, “So, it is not at all the case that there is something like a unified “scientific method” that governs all intellectual inquiry” (Bentz & Shapiro, 1998, p. 86). Inherent in this diversity is that idea that we can continue to develop new (and more diverse) approaches that may have some validity and usefulness in a postmodern context. And, to a greater or lesser extent (as with modernist approaches), these postmodern approaches might serve as useful indicators of progress for a science of metatheory. In the remainder of this section, I will investigate some potential benefits and limitations of these postmodern concepts as they relate to metatheory.

Anything goes is a difficult thing to measure. In the present context, it seems related to the idea that we should *avoid ontological arrogance*; and, in that process, strive toward more creative approaches to analysis. Indeed, we are not restricted to a single mode of analysis, rather we have a range of possible methods – and that range continues to expand. When applied to metatheoretical analysis, this suggests that it is valid to develop new methods of validation. Although, it should not be seen as ruling out existing approaches.

Deconstructing existing texts (especially those that appear to be privileged) is a process that is inherent to metatheory. Because those texts are the subject of analysis, it is difficult to avoid some form of deconstruction! There is also an important piece of recursion here because metatheoretical methods are themselves theories. Therefore, it is possible to use metatheory to deconstruct metatheory. We might measure the rate of deconstruction by tracking the level at which the deconstruction of a theory occurs. For example, a postmodern researcher might write in general terms about a theory (as a whole) – and that might represent an engagement on one level. If the researcher analyzes the propositions of a theory, that is another level. Then too, if the researcher investigates individual words - that is still another level. Deconstructing on all three of these levels (or any two) would be more effective than using any one.

In contrast to the modernist desire for objective knowledge, the postmodern approach recognizes the *contextual nature of knowledge*. For an analysis of theory, a metatheoretical approach might simply accept and appreciate all theory as providing useful material. Or, it might be said (for example) that a particular analysis will investigate theory from a specific context, perspective, or draw on theory from a specific source (e.g., theories of the 21st century). Identifying the context may be a form of categorization. For example, only theories made in the 20th century would be considered valid in a study of 20th century theory. It is also useful to recall that a process of social construction may serve to create new contexts. For example, Lyotard (1984) explains:

> From this point of view, an institution differs from a conversation in that it always requires supplementary constraints for statements to be declared admissible within its bounds. The constraints function to filter discursive potentials, interrupting possible connections in the communication networks: there are things that should not be said. They also privilege certain classes of statements (sometimes only one) whose predominance characterizes the discourse of the particular institution: there are things that should be said, and there are ways of saying them. Thus: orders in the army, prayer in church, denotation in the schools,

> narration in families, questions in philosophy, performativity in businesses. Bureaucratization is the outer limit of this tendency. (Lyotard, 1984, p. 14)

The *hermeneutic* nature of metatheory also lends itself to the postmodern perspective. That is because theories, the subject of investigation, are inherently textual. Here again, it is important to qualify and quantify the range and number of theories that are involved in an analysis. It would not be good science to say (for example), "I developed a metatheory based on some theories." The sources of those theories should be clearly articulated. A good practice for our nascent field of study might be to include our data – either in quotations within the text or in an appendix. That way, it is easier for other members of the metatheory community to evaluate the process and the results.

When one is exploring existing theory, the postmodern perspective offers an important, and interrelated set of relationships to look out for. Within one theory, or between two theories, one might seek to identify instances of *paradox*. This offers opportunities for finding new insights when the paradox is appreciated (perhaps experienced and embodied) and resolved. Galileo's experience provides one example of this approach. In ancient times, the prevailing theory of downward motion was that small objects fell slowly while large objects fell quickly. Galileo wondered what would happen if a small object were connected to a large object. And, through that thought experiment, recognized a paradox of the prevailing theory. That recognition impelled him to drop objects from tall buildings and so develop better theories of gravity. We might, enumerate the number of paradoxes found within a between theories as a simple path to evaluation.

Similarly, in studies of theory, we have the opportunity to investigate the *complexity* of theories and bodies of theory. Indeed, the complexity of a theory may be an indicator of that theory's maturity – suggesting a useful way to measure the potential usefulness of that theory (Ross & Glock-Grueneich, 2008). This approach may be easily employed by enumerating the concepts and/or connections within a theory. Theories may then be easily compared on at least one dimension. An opportunity exists here for a metatheorist to enumerate all the forms of enumeration within theory.

Because theory may be generally understood as a tool for reducing uncertainty (by providing an explanation of events), the idea of investigating the *uncertainty* within a theory bears a certain intriguing recursion. Often, we are able (by experiment or practical application) to test how well a theory works. The extent to which one's use of the theory enables one to predict future events may be regarded as a test of that theory's effectiveness. And, as a result, it is possible to compare two theories. However, postmodernism (along with complexity theory) holds that nothing is completely predictable. Therefore, if one finds a theory works 'perfectly' one may also be sure that one has fooled one's self.

In such situations, it is important to seek and appreciate the *ambiguity* of a situation. To purposefully seek out those events that are not predicted by the theory – those experimental anomalies that we know must exist, even though they may not be evident at the moment. This leads to a most important, difficult, and subtle postmodern technique – looking for things that are not there. In the analysis of theory, the discovery of a "missing link" can be an exciting find. As an example, from my personal experience, I am usually unimpressed by computer modeling experiments where the experiment merely confirms the researcher's expectations. Instead, I appreciate results that the researcher finds surprising.

Change is also a useful "thing" to look for in the study of theory. One might note, for example, that certain theories of physics have remained unchanged for hundreds of years… and wonder why. One might also investigate the great rapidity with which theories change and evolve as they are adapted by various authors over time, or as they change between the contexts of differing publications. One way to measure this is to determine the "dynamic robustness" of the theories (Wallis, 2008a).

One point of congruence between modernist and postmodernist approaches is the need for *critical analysis*. This has been addressed above in some detail. In contrast, *reflexive* approaches are more postmodern in nature – involving forms of social construction. To make these approaches more valid, it is useful for the metatheoretical researcher to describe the process by which the original theory was created, and/or the process by which the new metatheory or metatheoretical perspective was developed. A more rigorous quantification of the reflexive approach may be difficult because of the inherent complexity of the process. Here, again, is an opportunity for a deeper more comprehensive exploration of reflexive approaches to metatheory.

Far from understanding such indeterminacies as an impediment, the postmodern perspective sees such looseness as an opening for *interpretation* by the researcher. To provide some sense of validation, some *introspection* is useful. Here, the researcher should provide readers with some indication of that introspective process. This may include surfacing one's inspirations, concerns, and excitements. The process of introspection may lead to spiritual insight. This is, as history has shown, rather difficult to validate from an outside perspective. And, from the inside view (one's own sense of spirituality) may not make a great difference to the larger community. If the researcher avoids such self-revelation, the analysis might be seen as primarily intuitive or artistic.

In the postmodern world, the prevailing view is that we should appreciate the *artistic* and the *intuitive* in all sciences – including theory and metatheory. We are also encouraged to recognize that each work of art has more validity in some contexts, than in others. So, for validating a theory or metatheory as an art form, it is important to consider the artistic tradition from which it emerged and the context in which it is being used. I find an example in my own experience as a life and business coach. To me, the process side of coaching follows a series of questions such as: What worked well? What might you do differently next time? The artistic aspect, to me, comes in my ability to engage the client in a way that makes him or her feel that this is all part of a very natural conversation and leads to profound revelations of self and life. If other members of that community share my view of the art of coaching, they can evaluate the extent to which my coaching was artistic, or merely mechanically following a set of rote questions. For evaluative purposes, it seems that the analyst should describe the artistic standards to which the theory conforms (or creates).

The modern view of science is further enhanced by the postmodern ideas of *humanistic* inquiry, which calls for an increased *awareness of the human condition*. These include a range of *value-based* inquiry including *naturalist, feminist,* and *neo-Marxist* approaches that seek to *educate, emancipate,* and improve the human condition. These approaches may be evaluated from a number of directions – most or all of which are useful for "decolonizing" or de-emphasizing privileged texts in favor of more localized insights (Smith, 1999).

One might ask of one's self, "What is my intention in this investigation?" Or, we might ask, "Who benefits from this research?" Or, from the perspective of the possible participants, "To what extent does this research address our concerns?" These are, of course, a few of the many possible questions. Recursing briefly, it seems important to ask those who might be impacted about their opinions! Calás and Smircich (2005), for example, question the faulty logic of modern knowledge and suggest a range of new logics to support research that will foster change and emancipation. When applied in practice, one effective approach was to avoid the idea of expert knowledge, and to engage co-researchers in our collective experiments of all kinds. Generally, we may consider theories more valid to the extent that they are more able to raise awareness, educate, and emancipate. Thus, again, two theories may be compared and the more preferable one advanced.

One problem with soft sciences is abduction without critical examination (Hammersley, 2003). A reader may be "taken" with an idea; and, as a result, may feel that a theory appears "too good to be false." As a result, researchers might believe their theories or values are of the highest importance because, perhaps, those values have not been examined or deconstructed. Susan Haack (2001) seeks to differentiate truth and meaning by investigating four possible relationships between the two. She accepts the idea that there is an overlap between the two – that sometimes truth and ethics are one and the same, while other times that does not appear to be the case. Here, however, she relies on that elusive idea of truth. In a brilliant work (that includes a thoughtful conversation on Haack's paper), Martyn Hammersley notes, "I am not convinced that the distinction between what is morally wrong and what is epistemologically wrong can be sustained" (Hammersley, 2003). Rather than recounting millennia of thought, suffice to say that "truth" is an illusion that is sought by modernists and postmodernists alike. However, as "truth" seems so elusive, it seems an unlikely measure for validity and progress of metatheory.

Instead of a narrow, modernist science, Hammersley (2003) argues for link between epistemology, and morals, and calls for validation by a research community. This, in turn, seems to suggest that each and every paper should receive a thorough review by a close circle of readers. How do we accomplish such a thing? With all that is being written, who has time to do all that reading? Do we raise funds to pay for a large cadre of readers? It is an interesting possibility. Without funding, we might work to encourage readers to become more involved in the process – providing feedback to the authors and discussing the material more among themselves.

Then too, if knowledge is only valid if collaborative, should we require all that papers be co-authored? Or, is the act of learning, writing, review, reading, and conversation a sufficient level of collaboration? One might be tempted to say yes – it would certainly be easier to continue as we have – and to follow the traditions of modern academia. However, I feel that we are looking for something more. Instead of drawing a line and saying, "that side represents an unacceptable level of collaboration and this side is acceptable," we can pass beyond that dialectic and recognize that each written work may be represented on a scale of collaboration, And, reviewers, editors, and readers may rate that level of collaboration as a partial indicator for the collaborative-validity of the text.

For example, a book written by a single author would have a relatively low level of collaborative-validity compared with a paper written by two authors who received feedback from two reviewers. A book could claim a higher degree of validity where, for example, a team of authors determined among themselves the focus of the book, the focus of their individual chapters, and how those chapters would be linked, and where those authors spent a month sitting around a table co-authoring and co-editing one another's work.

Many concerns of validity are absorbed in another postmodern approach, which is more closely related to practice than to theory. Specifically, *praxis-oriented* methods that develop and show the usefulness of specific practices and points of view, within a specific context have shown themselves to be fairly effective. For example, the *Action-Research* approach. These methods, it seems may best be evaluated from within the group that develops and applies them. One such approach is the Future Search process (Weisbord & Janoff, 2000) which includes the creation of a mind map – a shared sense of the situation. This mind map may be understood as a form of theory, because it may be used to improve understanding and guide action. This approach suggests we may evaluate theory creation, at least in part, by the level of collaboration involved in the construction process. We might say that having more people involved indicates a quantitative measure of collaboration, while their satisfaction with the mind map indicates a qualitative measure of success.

These approaches to evaluation suggest that the only one who can truly evaluate the success of one's own method is the person who employs it. This *phenomenological* approach has its own limits. For example, one person might believe that plants grow better with fertilizer, while another believes that music is more conducive to plant growth. If, as outside observers, a community sees these two people growing food in their gardens, and one is more successful than the other, we might take that success as an indicator of a more effective underlying theory. We might (and probably should) also inquire about the details of those methods. For example, are they sustainable? Do they lead to negative environmental impacts? And, importantly, is there another, as yet undiscovered explanation for the differences observed?

In the academic review process, one author might develop and apply a method which he or she sees as very effective. Yet, the larger community might find very different results. One test of many is to determine if a theory is *practical / workable*. This might include purposeful experiments or simply some application in daily life. A strict postmodern stance might give equal validity to all theories that are applied because each one seems workable to the person who is employing it. And, the simple fact that a person is using the theory and finding it workable is certainly one level of validation. Also, the more people who find a theory workable might lend another level of validity.

This leads to at least two other extensions. First, that within one's own mind, an individual should seek to evaluate multiple theories to find if one is more workable than another. This might be seen as similar to an individual seeking a religion or spiritual practice that works best for him or her. Second, is the idea that the practicality or workability of a theory might be evaluated through the lenses of other postmodern approaches. For example, We might look at two theories and determine that one is more workable than the other based on the amount of change or the amount of emancipation is provides.

Over the course of time and communication, the above methods of investigation, communication and participation may be broadly understood as a form of **social construction**. That perspective suggests rich and complex interactions that include theory, practice, intuition, art and inspiration. This opens yet another interesting recursion because, ”the theory itself creates—it socially constructs—the terrain. A theory entails imposing interpretations (definitions, categories, and understandings) on behavior. Once we have a theory in mind, we pose questions that take those definitions, categories, and understandings for granted” (Landreine & Klonoff, 2001, p. 103).

This perspective points to a strength and limitation of the postmodern perspective. First, we are looking at mirrors through mirrors – so we can never be certain about what we see. This may cause difficulty for those who seek some absolutist foundation upon which they can rest. This difficulty may even impel some to a useless level of skepticism where they believe that nothing is real (and, in consequence, nothing has meaning). It is unfortunate that one result of this stance is that some abandon the search for new and more wonderful insights. Instead, this constructionist perspective also indicates that we recognize our limitations. And, from there, we can go on to transcend them.

Implicit in many of these approaches is the idea that the development and/or assessment of theory and metatheory are part of a process. In the field of metatheory, the development of a specific theory or metatheory is (from one perspective) understood to occur through the iterative process of induction and deduction (e.g., Hitt & Smith, 2005, p. 2). And, there are many other process-based perspectives to suggest paths for creating and evaluating theory. These process-based approaches may also be applied to a science of metatheory – suggesting an iterative process of creation and testing. It seems important to the science of metatheory that we develop new tests and test those tests. Further, there is a great opportunity to identify the processes by which each of these methods of creation and validation lead to one another.

An important tool for building and evaluating theory and metatheory is creativity. Because, if we are stuck within the map of our theory, no matter what the apparent efficacy of that theory, no matter what level of validation it exceeds, we know that we will always benefit from new and more creative approaches. Each new approach adds to the existing range of approaches; and, suggests ways to integrate and extend them. Despite (or, perhaps, because of) the range of options reflected upon in this section,

> It is far from evident that replacing conventional social science methodology with post-modern methods of interpretation and deconstruction constitutes any improvement in the social sciences. If adopted without modification, post-modern methodology leaves social science with no basis for knowledge claims and no rationale for choosing between conflicting interpretations. (Rosenau, 1992, p. 124)

Kitcher (1993) makes the important point that postmodern views, such as those presented in this section, should not be seen as existing in opposition to the views of modernity with the goal of eliminating the modernist view. Rather that these humanistic, artistic, and other diverse approaches actually serve to expand and change the modernist approaches. Changing the overall understanding of science to make it more rich, full, and inclusive. In the next section, I will investigate how we might understand a combination of modern and postmodern approaches. Not as a longer list of potential methodologies, but instead as existing in a carefully integrated relationship – an integral approach to science.

Integral Approaches to Metatheory

In moving metatheory toward a more scientific practice that includes modern and postmodern approaches, many forms of scholarship are possible. First, one might use any of the methods suggested here for creating and evaluating theory and metatheory. Another, more comprehensive approach, would be to use multiple methods. A more nuanced and sophisticated scholarship would involve a combination of methods that are mutually supporting – that is to say, integrated. This perspective is, in part, an answer to Fred Kofman’s (2010) call to avoid ontological arrogance with our underlying ideology, and so encouraged us to accept alternative views. This approach is postmodern; and, the call also holds true for our ideology about postmodernism. We should be on the lookout for what is missing and how postmodernism might be improved. This is especially important as there is a lack of agreement on key issues – even within the postmodern community (Rosenau, 1992).

Between modern and postmodern there are many disconnects. For example, Critchley (2001) tells how the Vienna Circle sought a science free of emotion, religion, and metaphysics. While, in contrast, an integral approach is about exploring how they might be rejoined as in *The Marriage of Sense and Soul* (Wilber, 1999). There, Wilber explores in some depth the importance of integrating science and religion. This is an appealing perspective because the traditional role of science is to find truth, while the traditional role of religion is to find meaning. This kind of integrative approach suggests that we are creating something that is more than the sum of the parts.

There are also overlaps between modern and postmodern approaches. Both seek knowledge and understanding, both call for critical analysis, and both appreciate the benefits applying theory (“testing” for modernists and “usefulness” or “workable” in postmodern terminology). What is missing between the two versions of science is a focus on how they might work together. This is an integral approach, which recognizes the benefits of both and seeks to bring them together to create a more complete and effective understanding. Kitcher (1993) suggests the need for overlapping and interlinked methods for measurement and Murray states:

> Integral approaches give equal importance to the subjective and objective aspects of world. Seen through this lens science and technology are not divorced from questions of meaning, identify, aesthetics, and ethics. . . . It does so not mere by critiquing other theories but my proposing an integrative framework that coordinates these theories and also by incorporating subjective and Intersubjective matters of self, culture, and spirit. (Murray, 2006, p. 215)

Let us move now to an exploration of approaches for a scientific advancement of metatheory that interlinks the best of modern and postmodern worlds. This approach is called triangulation which works under the assumption that it is desirable, to use a mix of approaches. This process is supported by a growing number of scholars (e.g., Edwards & Volkmann, 2008; Lewis & Grimes, 1999; Roe, 1998). An excellent application of this approach may be found in Lewis who notes in an introductory explanation of her study:

> The strategy—Metatriangulation (Lewis & Grimes, 1999) —entailed using paradigm lenses to construct alternative accounts of AMT implementation. The second section summarizes these accounts, which highlight varied vicious cycles during the change process. Third, I use paradox literature to build a metaframework, depicting change as a multidimensional cycle, swirling around cognitive, action and institutional paradoxes. Paradigm lenses detail each paradox, revealing complex, systemic tensions between stability and change. The conclusion addresses implications for managing change paradoxes and future research. (Lewis, 2009, p. 109)

A reading of Lyotard (1984) suggests triangulation using a combination of categorization, critical evaluation, and application. Koller (2006) suggests using a purposeful blend of approaches including contemplation (sprit), reason (mind), and body (senses). These kinds of triangulation suggest more than a range of coverage within a single sphere of thought, they also suggest an interrelationship between worlds. To expound on one such relationship, I draw on my recent work from the *Integral Review* (Wallis, 2008b).

Briefly, one may usefully and effectively view theory validation from three general points of view – or three worlds. Those three worlds are summed up as Theory, Facts/Data, and Meaning/Emotions. Within each world there are (at least) three levels of validation – with each level having more validity than the one below it. From an "outside" view, each theory may be seen to have greater or lesser validity within any one of the three worlds (see Table 3).

Table 3. Dimensions of Validity (Wallis, 2008b)

	Level 1	Level 2	Level 3
World One (Facts or data)	Uses objective data.	Uses objective data from multiple sources.	Future facts are predicted.
World Two (Meaning, emotions)	Makes sense to author.	Makes sense to editor, reviewers, and readers.	Consensus of expert opinion (this theory is preferred over other theoretical options).
World Three (Theory)	Includes logical arguments.	Theory is constructed of specific propositions.	Theory is constructed of co-causal propositions.

Another point is that there are two general ways to evaluate a theory or metatheory. One is to evaluate it from "within" one of the worlds; the other is to evaluate it from two or more perspectives "between" worlds. From an "outside" view, we can look at validation between the worlds. "Significantly, this distribution of worlds creates the opportunity to understand each of the three worlds in integral, co-causal relationship to one another" (Wallis, 2008b, p. 78). For example, a theory that is essentially a metaphor might have little or no validity in the world of theory. It might, if it were a compelling metaphor, have greater emotional/spiritual validity. If that metaphor were applied successfully to an organizational change effort, it might be seen to have greater perception/data based validity.

On another part of the spectrum, a theory from physics might have a high level of validity on the world of theory – and on the world of facts/data may prove very effective. On the other hand, on the world of meaning, the theory may be entirely uninspiring. One might see a well-written or inspirational, book as having great validity in the world of feeling and spirit, yet have little validity as a theory or in practical application. In contrast, a profundity of raw data might have great validity within its own world, but without a theory to make sense of it, it is merely noise – so has no validity within the world of feeling/spirit.

In the same way that great art calls for great reflection, a high level of validity in any one world seems to call for the generation of new understandings in each of the other worlds. And, we might imagine that a high level of validity in two worlds might create a very strong pull for increased validation in the third world. For example, having a great amount of data seems to call for a theory to make sense of it. Then too, a great deal of data also has a sensory component, so it calls for reflection and appreciation.

Popper's (2002) famous (and famously modernist) work suggests the best way to validate a theory is in the way it allows for predictions in perceptual data. A theory of physics, which fails to predict change, should be rejected. However, in the social sciences, the process is a highly complex issue of recursion. Changes in theory might cause changes in productivity but they may also alter an individual's values (e.g., one's personal feeling about what is important). So, an individual may no longer place the same value on the items being produced. Indeed, "individuals working on an assembly line might (based on an emerging mindset) change their minds and decide that the human producer is more important than the objects on the conveyor belt"(Wallis, 2008b, pp. 80-81). There is a great opportunity for scholars to investigate the potential interrelationship of the many approaches presented in this article and this special issue, as a whole.

Advancing the Field

In *The Trouble With Physics: The Rise of String Theory, the Fall of Science and What Comes Next*, Lee Smolin (2006) reflects on his experiences as a physicist who was dedicated to the development of string theory – the creation of a single one, best, totalizing theory of physics. Smolin concluded that such a development is impractical and perhaps impossible. His experience turned him away from a staunch modernist perspective (and, may provide some insights for our exploration here). Smolin found that progress in science seems to take two forms – innovation and consensus. The two seem closely interrelated – we need both to advance.

This article has presented some basic ideas to clarify and encourage the continued emergence of metatheory as a science. To the extent that metatheoretical methodologies and processes seem to fit a fairly specific definition of science, it seems that we have the basic pieces in place to conduct a legitimate science of metatheory; although, more development and clarification of methodologies appears to be required. Further, if we are to be a science, we must also apply these rigorous methodologies – something the broader field of the social sciences has mainly avoided. There is reason to hope that we are moving toward a change – an improvement – including a more purposeful application of metatheoretical principles.

One may anticipate that metatheory, as a science, will not be immediately adapted by all social scientists. First, some may too deeply invested in the present paradigm. They might, for example, be interested in creating theory for publication instead of application. Second, by their seemingly successful experience, these academics may believe that they "know" how to create good theory – and so do not need to change their approaches. We might liken their theory-creation ability to the ability of a cook to bake a cake. They need no recipe because they have a great deal of experience in this department. Their students, however, have not yet learned the knack. And, the students may benefit most from learning how to follow a recipe. In short, we might achieve some success in advancing the practice of theorizing by developing and implementing a cross-disciplinary program to teach metatheory to graduate students. After all, they have not "grown up" with the fragmented fields of social theory, so may need additional tools to cope with the plethora of theories.

In the above sections, I have noted many opportunities and directions for future studies to advance scientific metatheory. Meehl (2002, p. 343) states, "I view this disparity between a (purported) logical truism and scientific practice to be one of the most important and badly neglected metatheoretical puzzles." A great opportunity exists for metatheorists to conduct cliometric analyses and so advance our understanding of theory, metatheory, and more. Another important opportunity exists for advancing the metatheory conversation through the application of metatheory. One place that this can occur with some ease is in the classroom. For example, professors could assign students to conduct purposefully metatheoretical analyses. Combined in a public database, the results might provide a useful source for metatheoretical analyses.

Reviewers of academic journals could aid in advancing the field by applying clear metatheoretical metrics when evaluating submissions. This way, each pass through the review process would result in better theory (rather than the creation of theory that is simply different). Similarly, those who review research proposals could also apply metrics to determine which theories are more likely to be effective than others.

The study of theory is appropriately referred to as metatheory (or metatheorizing) where, "The problem lies in how we differentiate between these different kinds of big pictures and the various ways of creating them. We have almost no way of formally distinguishing between metatheory as a scientific process of building metalevel conceptual frameworks or metatheory as grand storytelling or metatheory as philosophical musing. For the sake of all different forms of creating grand narratives this situation needs to change" (Edwards, personal communication, October 18, 2009). In this article, I hope that I have created a framework that we may use to address these issues.

Our nascent science is not at a point where we can apply labels with great confidence (although many have tried). It may be that we need to do some experimenting – we need to try out various methods of metatheorizing in quasi-controlled experimental settings and decide from the results what is our best tool for a particular project. We might find, in time, that certain metatheoretical approaches are useful for creating theory, while others are more useful for evaluating theory. Specifically, we need to have and to use a rigorous, scientific, and repeatable approach to metatheory if this field is to have any legitimacy; and, of greater importance, if we are to develop effective theories for addressing the many personal and societal issues of our age.

There are, of course, limits to the emerging science that I have sketched in this paper. I do not intend this to be the "last word" so much as a preliminary investigation of relevant components. My hope is not to be seen as some "absolute expert" so much as a "conversation-starter." As noted above, there are many opportunities presented in this paper for additional exploration. These include more nuanced investigations into each of the above-mentioned building blocks of modernist science, as well as investigations into how those blocks might be more carefully integrated with one another. Additionally, there are alternative definitions of science that might be explored and contrasted with the one presented above.

Reflections

In the development of this paper, I received a strong call from one reviewer to conform to the dictates of postmodernism, rather than modernism. Due to many personal stresses, I initially resisted that call. Taking time to breathe, and be more open, I worked to answer the call towards greater inclusiveness; I also worked to avoid the totalizing call of postmodernity and modernity, both. As a result, I was impelled on to a more integral approach that combines modernity and postmodernity.

It occurred to me that there is a key distinction between modernity and postmodernity. First, modern science sees progress as an accumulation of knowledge. Second, postmodernity seems to loosen the "direction" of what constitutes valid knowledge by accepting multiple forms of knowledge. Yet, postmodernity seems also to retain the idea that accumulation is important. This should come as no surprise, as accumulation serve to immediately validate any and every insight. It cannot be discarded without reducing the storehouse of knowledge – be it a modern or postmodern storehouse. What remains is the question of what to do with that storehouse of knowledge.

Integral approaches suggest that identifying interrelationships between existing forms of knowledge may create new knowledge. This takes us beyond simple accumulation and moves toward more effective approaches. This, in turn, implies the need for methods for creating theory and metatheory – where they are understood to be integrated knowledge, rather than simple accumulations. When one identifies relationships between previously unconnected bits of knowledge one tends to experience a sudden, perhaps spiritual, sense of wonderment or awakening. And, one is on the path to the creation of theory and metatheory.

Conclusion

It may be true, from a modern perspective, that we will benefit from validating theory and metatheory. It may be true, from a postmodern view, that there is no single approach to validating theory and metatheory. From an integral perspective, it seems reasonable that these forms of validation must be interrelated. In creating a science of metatheory, it seems we must recreate what it means to have a science.

At the risk of creating another layer of “meta-ness” it seems that the most useful approach will be to validate each theory and metatheory by using at least three forms of evaluation. And, importantly, those forms should be as different as possible. For example, it might be useful to evaluate a theory using a combination of spiritual, creative, and aesthetic measures. However, a more effective (and more challenging) approach would integrate more diverse points of view to provide very different measures (e.g., artistic, structural, and practical). In this, it may be seen that the greater diversity will lead to greater strength and the many will lead to the one – just as the success of one theory leads to greater diversity in application.

In this article, I have identified and investigated a variety of components needed for recognizing metatheory as a rigorous, and legitimate science from modern, postmodern, and integral perspectives. Those methods should be reflected, as rigorously as possible, in the multiple building blocks of science that point the way to advancement. Our ability to advance metatheory is founded on our ability to meet multiple requirements in an integrated way – not simply one or two. Implicit in this article is that idea that metatheoreticians must be rigorous in their pursuit and application of these scientific ideals. We don’t want metatheory to be flapping around in circles.

As metatheoreticians strive to meet these goals, we will strengthen the withered wing of theory and so enable the bird of science to fly. Extending that metaphor slightly, we may recognize the need for a body – that connects those wings and provides a sense of purpose for that flight. For this body, we need to develop research communities whose members agree to conduct careful, rigorous, repeats of experiments and studies in metatheory (including building, testing, identifying the range of metatheories).

This new community will be reflected in our journals. This, in turn, implies that editors who are interested in supporting the emergence of a new science should stand ready to publish works that do not meet the more traditional “literary” standard of innovation, but instead rise to meet the equally high (and possibly more important) standard of scientific repetition. An interesting and useful collaborative effort might begin with a single metatheory, and ask seven authors to address that metatheory – each from the perspective of a single building block of science.

This article serves as a starting point for conversations on metatheory as a rigorous science, and how that science (as a process) might be improved for the development of better metatheory. Improvements in this field will improve our ability to advance our effectiveness as scholars working within and between other branches of the social sciences. In turn, those advances will have a profound effect on our ability to work for the betterment of our world.

Appendix: Definitions of Metatheory

Dominic Abrams and Michael Hogg (2004)

A metatheory is like a good travel guide - it tells you where to go and where not to go, what is worthwhile and what is not, the best way to get to a destination, and where it is best to rest a while. Metatheoretical conviction provides structure and direction, it informs the sorts of questions one asks and does not ask, and it furnishes a passion that makes the quest exciting and buffers one from disappointments along the way. (p. 98)

A metatheory should provide an alternative framework for asking particular questions, not a complete explanation for all phenomena. The appropriate mission is not to convince others that the metatheory is right and that others are wrong, but to show how a particular metatheory can be useful to account for a specific class and range of phenomena. (p. 100)

A strong metatheory helps to put the body parts together in a meaningful structure and then to theorize the links between those parts. In addition, identifying the metatheory behind a particular theory helps reveal potentially interesting and useful links to other theories. (p. 100)

[Metatheory] encourages the integration of concepts across contexts. (p. 100)

Jack Anchin (2008b)

Unifying knowledge in any field of endeavor requires metatheory comprising a conceptual scaffolding that is sufficiently broad to encompass all of the specific knowledge domains distinctly pertinent to the field under consideration, that can serve as a coherent framework for systematically interrelating the essential knowledge elements within and among those domains, and that extends conceptual tendrils into other fields of study. (p. 235)

Jack Anchin (2008a)

Among vital purposes served by metatheory is its function as scaffolding for integrating more specific theories that conceptually and empirically map different aspects of the phenomena under study. (p. 804)

Terese Bondas & Elisabeth O. C. Hall (2007)

Metatheory analysis is an examination of theories to determine the link between the theoretical perspective that frames each primary study and the methods, findings, and conclusions of the research. (p. 115)

Richard Clarke (2010)

Metatheory is the 'theory of theory,' to be precise, the study of those underlying assumptions which shape particular theoretical perspectives.

Robert T. Craig (2009)

Metatheory is theory about theory.

Brenda Dervin (1999)

One major point here is that metatheory can be used in such a way that it releases research in always partial but still significant ways from implicit assumptions and draws these assumptions out into the light of day where they can be examined, interrogated and tested. (P. 748)

Metatheory must be an inherently deconstructive enterprise.

David Faust (2005)

As data form the subject matter for theories, theories and other scientific products form a key subject matter for metatheory or meta-science, organized and directed by methods that, in large part, remain to be developed.

Deborah L. Finfgeld (2003)

[Metatheory is the] Analysis and interpretation of theoretical, philosophical, and cognitive perspectives; sources and assumptions; and contexts across multiple qualitative studies. (p. 895)

Adam Maria Gadomski (2001)

A meta-theory M may represent the specific point of view on a certain class or set of theories T and this viewpoint generates meta-properties of T. Meta-properties are the consequence of the relation between M and T, but they are not the properties of any T application domain. More formally speaking, a theory T of the domain D is a meta-theory if D is a theory or a set of theories. For example, in computer science, the Theory of Data Bases Organization is a meta-theory for every specific (domain-dependent) theory of the data organization/structuring and management.

Willis Overton (2007)

A metatheory is a coherent set of interlocking principles that both describes and prescribes what is meaningful and meaning-less, acceptable and unacceptable, central and peripheral, as theory – the means of conceptual exploration – and as method – the means of observational exploration . . . a metatheory entails standards of judgment and evaluation. Scientific metatheory transcend . . . theories and methods in the sense that they define the context in which theoretical and methodological concepts are constructed. Theories and methods refer directly to the empirical world, while metatheories refer to methods themselves. There are many important features of metatheories, including the fact that they are ubiquitous – all theories and methods are formulated and operate within some metatheory – and the fact that they often reside quietly and unrecognized in the background of our day-to-day empirical science." (p. 154)

A metatheory is a coherent set of interlocking principles that both describes and prescribes what is meaningful and meaningless, acceptable and unacceptable, central and peripheral, as theory – the means of conceptual exploration – and as method – the means of observational exploration – in a scientific discipline. In other words, a metatheory entails standards of judgment and evaluation. Scientific metatheories transcend (i.e. 'meta') theories and methods in the sense that they define the context in which theoretical and methodological concepts are constructed. Theories and methods refer directly to the empirical world, while metatheories refer to the theories and methods themselves. (p. 155)

Barbara Paterson, Sally Thorne, Connie Canam and Carol Jillings (2001)

Meta-theory is a critical exploration of the theoretical frameworks or lenses that have provided direction to research and to researchers, as well as the theory that has arisen from research in a particular field of study.

Meta-theory involves the analysis of primary studies for the implications of their theoretical orientations. (p. 92)

George Ritzer (1988)

Metatheory is concerned . . . with the study of theories, theorists, communities of theorists, as well as with the larger intellectual and social context of theories and theorists. (p. 188)

A metatheory is a broad perspective that overarches two, or more, theories (Ritzer, 2009).

Leslie Sklair (1988)

A metatheory is a set of assumptions about the constituent parts of the world and about the possibility of knowledge of them. The distinguishing characteristic of a metatheory is that it refuses to accept any burden of empirical proof by displacing the burden of empirical proof onto the theories that are logically deducible from it. An effective metatheory is one which manages to create a high degree of coherence between epistemology and the objects of knowledge (roughly, abstractions). . . . The hallmark of a metatheory in science is that it invites empirical proof (or, in some versions, refutation) by producing theories and hypotheses that can be tested.

Tendzin Takla and Whitney Pape (1985)

By metatheory we refer to the cluster of fundamental, but often implicit, presuppositions that underlie or embed a theory.

Sally Thorne, Louise Jensen, Margaret H. Kearney, George Noblit & Margarete Sandelowski (2004)

Metatheory [is] the study of the frames of reference used in a set of primary studies. (p. 1357)

Jonathan Turner (1990)

. . . it is reasonable to conclude that metatheory should come after we have produced some theory. Metatheory is not about what assumptions and presuppositions sociology should have, but about the structure and implications of existent theories. (p. 38)

. . . let me offer some proscriptions and prescriptions about how best to perform metatheorizing.

First, here are some proscriptions or metatheoretical taboos (p. 39):

1. Avoid talking about theorists; instead, talk about theories.
2. Avoid discussions of intellectual context, place, and time; instead, discuss social processes denoted by concepts, models, and propositions.
3. Avoid debates over philosophical issues; instead, commit one's energies to the simple assumptions that there is a world out there and that it can be understood with concepts, models, and propositions.
4. Avoid commitments to ideologies; instead, develop concepts, models, and propositions that denote operative processes in the universe (there will always be someone to expose ideological biases without your help).
5. Ignore the particulars of history; instead, examine those more general and generic processes that cut across time and place (leave something for historians to do; or, if history is used, let it involve an empirical test or assessment of a theory or model).

Here is my list of prescriptions (pp. 40-41):

1. Evaluate the clarity and adequacy of concepts, propositions, and models.
2. Suggest points of similarity, convergence, or divergence with other theories.
3. Pull together existing empirical (including historical) studies to access the plausibility of a theory.
4. Extract what is viewed as useful and plausible in a theory from what is considered less so.
5. Synthesize a theory, or portions thereof, with other theories.
6. Rewrite a theory in light of empirical or conceptual considerations.
7. Formalize a theory by stating it more precisely.
8. Restate a theory in better language.
9. Make deductions from a theory so as to facilitate empirical assessment.

Walter Wallace (1992)

Synthetic metatheory sorts whole theories into two or more overarching categories. Analytic metatheory parses each theory into two or more components and then sorts these components into categories representing various types of assumptions, observable variables and causal relations among such variables. (p. 53)

Deena Weinstein and Michael Weinstein (1991)

Metatheory treats the multiplicity of theorizations as an opportunity for multiple operations of analysis and synthesis (p.140).

[Metatheory] has a concrete empirical referent, sociological theory, and studies its ‘underlying structures’ . . . As a . . . theory of theory, metatheory is simply that part of a general sociology of knowledge which happens to take sociology and sociological knowledge as its empirical referents. From the critic’s perspective, there can be nothing objectionable about this kind of metatheory, for it opens up a substantive and empirical research agenda” (pp. 287-288).

Wikipedia (2009)

A metatheory or meta-theory is a theory whose subject matter is some other theory. In other words it is a theory about a theory. Statements made in the metatheory about the theory are called metatheorems.

Shanyang Zhao (2010)

Metatheory is a subtype of metastudy that focuses on the examination of theory and theorizing.

Metatheoriebildung in der dialogischen Konfliktbearbeitung – ein konzeptioneller Vorschlag am Beispiel der Konflikttransformation nach Galtung und des Konfliktmanagements nach Glasl und des Integralen Ansatzes nach Wilber

Metatheory Building in Dialogical Conflict Solutions: Conceptual Advice Using the Conflict Transformation Approach of Galtung, Conflict Management by Glasl and the Integral Approach of Wilber

Karim Fathi[1]

Extended Abstract in English

Given the increasingly complex nature of conflicts, a corresponding increase of new methods can be observed in Peace and Conflict Studies. At this juncture, metatheories aimed at integrating this labyrinth of diverse methods is becoming necessary. This paper will draft a conceptual proposal, discussing two well-known holistic approaches of mediative conflict management in an integrative context:

- The Conflict Management Approach by Prof. Dr. Friedrich Glasl (2004).
- The Conflict Transformation Approach (The Transcend Method) by Prof. Dr. Johan Galtung (2000).

The theoretical assumptions of this paper are based on the integral approach by Ken Wilber (2001) – a highly discussed "Theory of Everything" that has thus far remained widely ignored in

He holds a graduate degree in Sociology (Social Economics) from the University of Hamburg and an MA in Peace and Conflict Studies from Philipps-Universität Marburg, Germany. Currently, Karim Fathi is conflict advisor in the Transcend network and works as an associated research and project assistant at Berghof Conflict Research in Berlin, Germany. fathi.karim@googlemail.com
Karim Fathi, Jahrgang 1979, ist in Hamburg geboren. Er absolvierte sein Erststudium in Soziologie (Schwerpunkt Sozialökonomie) an der Hamburger Universität. Sein Zweitstudium schloss er mit einem M.A. in Friedens- und Konfliktforschung ab. Derzeit ist Karim Fathi unter anderem als Konfliktberater im Transcend-Netzwerk sowie als assoziierter Forschungs- und Projektassistent am Berghof Conflict Research Institut in Berlin tätig. fathi.karim@googlemail.com

SOME RIGHTS RESERVED

Peace and Conflict Studies, yet. Therefore, it is also of interest to scrutinise the integral approach with regard to its contribution for an integrated Peace and Conflict Studies. The analysis was conducted as follows:

1. Introduction of two holistic Peace and Conflict Studies approaches:

a. The *Conflict Management Approach* by Glasl implies a number of categories and entry points (Ansatzmomente) resulting in a complex intervention spectrum. In this regard, the consideration of escalation levels is highly important, integrating perception-oriented (low escalation), emotion-oriented (medium escalation) and behaviour-oriented (high escalation) measures. The spectrum may be combined with other categories such as conflict type (hot or cold) or criteria of conflict analysis (issues, conflict trends etc.).

b. The *Conflict Transformation Approach* by Galtung is characterised by a three-fold schematic, enabling a complex understanding of violence (direct, cultural, structural), conflict (behaviour, assumptions, contradictions) and peace (non-violence, empathy, creativity). Moreover, Galtung’s model implies three conflict phases (before, during, after violence) as well as five styles of conflict management.

c. The integral approach can be understood as a “Theory of Everything“ presupposing that no perspective can be 100% wrong (but “partially true”). Its methodology is based on “map making” by categorizing established paradigms, methods and theories in a holistic metacontext. By means of five categories – quadrants, levels, lines, types, states (altogether AQAL: All Quadrants All Lines) – the integral approach claims to consider as many aspects of reality as possible in a holistic concept.

2. Outline of an integration model:

a. *Possibility of an epistemological integration of the introduced methods*:
The five AQAL-dimensions enable the epistemological foci of the approaches by Galtung and Glasl to be revealed. A point in which both approaches may complement each other becomes apparent by combining a vertical spectrum of escalation levels (Glasl) and a horizontal axis of different fields of violence (Galtung). It might be of further research interest to analyse the potential extent of a correlation to evolution oriented level schemes (Wilber), e.g., referring to development psychology or evolution theory. Are there different development levels (Wilber) of direct, cultural and structural violence (Galtung)? Is there a correlation between levels of development (Wilber) and regression (Glasl)? This paper concludes for both cases a cautious “yes.” In doing so, the consideration of the other AQAL-dimensions (types, lines, states) provides further information.

b. *Proposal for an integral heuristic*:
The consideration of vertical (levels) and horizontal (quadrants, types, lines) AQAL-categories is also useful to integrate heuristics. However, the integral approach itself does not represent a method of heuristic and practical effect, though it is useful to adapt the AQAL-categories and to consider new tools that are highly relevant for the Peace and

Conflict Studies. The heuristic integral concept is based on the vertical conflict scheme by Galtung (three conflict phases) and Glasl (escalation model) and additionally considers horizontal analysis categories (e.g., types: conflict type; quadrants: fields of violence) on each level. A complex integral Peace and Conflict Studies heuristic is the result, under the consideration of an adapted AQAL-model.

3. Conclusion and critique:

The analysis shows that the primary use of the integral approach for Peace and Conflict Studies lies in its ability to integrate the epistemological benchmarks of different approaches. Thereby, the integral concept provides information about some points in which the epistemes and heuristics of Glasl and Galtung may complement each other which could enrich the construction of a metatheory in the Peace and Conflict Studies (especially with regard to the combination of Glasl's escalation model and Galtung's three-folded schematics). However, it should be noted that the examples of Glasl's and Galtung's meta-approaches provide other important integration and categorisation concepts which are not yet covered by the integral approach (at least in its present form). Thus, the AQAL itself may be inappropriate to integrate methods in the context of their orientation (e.g., process, client, solution oriented) or regarding the modus operandi (e.g., (a) conflict analysis, (b) intervention planning, (c) action). The AQAL is not only lacking meta-categories which are adapted to the particular heuristic requirements of Peace and Conflict Studies, also the contextualisation of its dimensions – e.g., the evolutionary scope of the level dimension – may not always be adequate and useful.

Generally, it can be concluded that metatheory building requires to consider different – in some respects contradicting – possibilities of formulating meta-categories. With regard to Peace and Conflict Studies, there remain a lot of research questions to be opened, since different meta-contexts may follow differing "main interests." Preliminarily, it can be concluded that a really integrated Peace and Conflict Researcher should be familiar with epistemological *and* heuristic contexts, but also metatheoretical *and* theoretical contexts as well.

Abstract - Deutsch

Angesichts immer komplexerer Konflikte ist in der Friedens- und Konfliktforschung eine zunehmende Methodenvielfalt zu beobachten sowie ein entsprechender Bedarf, diese metatheoreitsch zu integrieren. Im Rahmen des vorliegenden Papers soll hierzu ein konzeptioneller Vorschlag skizziert werden, indem zwei holistische und bekannte Ansätze der mediativen Konfliktbearbeitung in einem integrativen Kontext diskutiert werden:

- Der Konfliktmanagement-Ansatz nach Prof. Dr. Friedrich Glasl (2004).
- Die Transcend-Methode nach Prof. Dr. Johan Galtung (2000).

Den theoretischen Rahmen, auf den sich die Überlegungen dieser Arbeit stützen, liefert der *Integrale Ansatz* (IA) von Ken Wilber (2001) – eine viel diskutierte philosophische „Theorie von Allem“, die im Rahmen der Friedens- und Konfliktforschung jedoch noch weitgehend unberücksichtigt geblieben ist. Daher ist es im Rahmen der Arbeit von weiterem Interesse den IA auf seinen Mehrwert für eine integrierte Friedens- und Konfliktforschung zu untersuchen.

Die Untersuchung verlief wie folgt:

1. Vorstellung der in der Untersuchung berücksichtigten Ansätze:

a. Der *Konfliktmanagement-Ansatz* von Glasl unterscheidet eine Vielzahl von Kategorien und Ansatzmomenten, die ein komplexes Interventionsspektrum ergeben. Sehr wichtig ist hierbei unter anderem die Berücksichtigung von Eskalationsstufen, die eine Unterscheidung zwischen perzeptions- (niedrige Eskalation), gefühls- (mittlere Eskalation) und verhaltensorientierten (hohe Eskalation) Maßnahmen ermöglichen.

b. Die *Konflikttransformation* nach Galtung zeichnet sich unter anderem durch dreigeteilte Schematisierungen aus, die ein komplexes Verständnis von Gewalt (direkt, kulturell, strukturell), Konflikt (Verhalten, Annahmen, Widerspruch) und Frieden (Gewaltlosigkeit, Empathie, Kreativität) ermöglichen. Darüber hinaus, unterscheidet Galtung unter anderem auch drei Phasen des Konflikts (vor, während, nach der Gewalt).

c. Der *IA* versteht sich als eine Methode des metatheoretischen „Map makings". Mittels fünf Kategorien – Quadranten, Ebenen, Linien, Typen, Zustände (zusammen AQAL) – folgt der IA dem Anspruch, so vielen Aspekten der Realität wie möglich in einem Gesamtkonzept Rechnung zu tragen.

2. Skizze eines Integrationsmodells:

a. *Möglichkeit zur epistemologischen Integration der vorgestellten Konfliktbearbeitungsansätze*:
Mittels der fünf Dimensionen des AQAL lassen sich die epistemologischen Schwerpunkte der Ansätze von Glasl und Galtung darstellen. Ein gegenseitiger Ergänzungspunkt bietet sich vor allem bei der kombinierten Berücksichtigung eines vertikalen Spektrums von Eskalationsstufen (Glasl) und eines horizontalen Rasters von mehreren Gewaltbereichen (Galtung).

b. *Vorschlag für ein heuristisches Gesamtkonzept*:
Der IA stellt keine heuristisch-praktische Methode dar, daher ist es in diesem Fall sinnvoll, die AQAL-Kategorien anzupassen und sogar neue Kategorien, die für die Friedens- und Konfliktforschung besonders relevant sind, zu berücksichtigen. Das heuristische Gesamtkonzept nimmt das vertikale Konfliktschema von Galtung (drei Phasen des Konflikts) und Glasl (Eskalationsmodell) zum Ausgangspunkt und berücksichtigt zusätzlich auf jeder Ebene horizontale Untersuchungskriterien (z.B. Quadranten: Gewaltart etc.)

3. Fazit und Kritik:

Die Untersuchungen dieser Arbeit verdeutlichen, dass der Mehrwert des IA für die Friedens- und Konfliktforschung vor allem darin liegt, die epistemologischen Bezugspunkte unterschiedlicher Ansätze zu integrieren. Am Beispiel der Ansätze von Glasl und Galtung zeigt sich aber auf, dass ein heuristisches Metamodell zusätzliche Metakategorien erfordert, die von

der Schematisierung des IA nicht erfasst werden. Es lässt sich daher schließen, dass sich die Metatheoriebildung für die Friedens- und Konfliktforschung, vielfältigen Herausforderungen und weiterführenden Forschungsfragen gegenübersieht, zumal sich mehrere Metakontexte unterscheiden lassen, mit differierenden Geltungsansprüchen und „Integrationslogiken“. Ein wirklich integrierter Friedens- und Konfliktforscher sollte sich im Idealfall sowohl im Bereich der epistemologischen *und* im heuristischen, im metatheoretischen *und* im theoretischen Kontext sicher bewegen können.

Schlüsselwörter: AQAL, Dialog, Ebene, epistemologisch, Eskalation, Frieden, Galtung, Glasl, heuristisch, integral, Konflikt, Konfliktmanagement, Konflikttransformation, Kontext, Linie, Metatheorie, Quadrant, Typ, Wilber, Zustand

Einleitung

Problembereich der Untersuchung

Angesichts immer komplexerer Konflikte ist in der Friedens- und Konfliktforschung ein Zuwachs immer neuer Methoden zu beobachten. Mit der Vielfalt an Ansätzen und ihrer wachsenden Professionalisierung, die die letzen Jahre mit sich brachten, wächst in der Friedens- und Konfliktforschung nicht nur die Unübersichtlichkeit, sondern es zeigen sich zunehmend auch methodische Defizite und Grenzen.

Das hier vorliegende Paper möchte nun einen Beitrag zu dem an Bedeutung gewinnenden, bislang aber noch wenig erschlossenen, Feld der Metatheoriebildung in der Friedens- und Konfliktforschung leisten. Hierbei wird von der Grundannahme ausgegangen, dass die Friedens- und Konfliktforschung eine „nicht-systematische“ bzw. eine „wilde Forschungsrichtung“ ist, die stärker als die eher „disziplinär“ verorteten Sozial- und Politikwissenschaften auf Transdisziplinarität und Praxisrelevanz zielt (vgl. Graf 2009, S. 27).

In der Friedens- und Konfliktforschung herrschte bislang vor allem ein interdisziplinärer Ansatz vor[2], der sich aber als begrenzt erweist, unterschiedliche Perspektiven in einen holistischen Gesamtzusammenhang zu integrieren. Zu den wenigen und zugleich bekanntesten metatheoretischen Ansätzen in der Friedens- und Konfliktforschung dürften zum einen die Konflikttransformation nach Johan Galtung (TRANSCEND)[3] und der Konfliktmanagementansatz nach Friedrich Glasl[4] gehören.

- Schon in den 70er Jahren definierte *Galtung* erste Kriterien zum Design eines Metamodells, welches von mehreren, quasi parallelen, Realitätsbereichen ausgeht, die es mehr oder weniger gleichberechtigt und „synchron“ zu berücksichtigen gilt (vgl. Galtung 2000; Galtung 2008). Typisch hierfür ist ein Design mit einer nicht-hierarchischen („horizontalen“) Kategorienanordnung.
- *Glasls* weit verbreitetes Eskalationsstufenmodell leistet hingegen eine Vorbildfunktion bei der Integrierung unterschiedlicher Mediationsansätze (vgl. Glasl 2004a) in einen sequenziellen, „vertikal“ designten, „Ad Hoc“-Kontext.

Ein metatheoretischer Ansatz, der dazu beitragen könnte, die stetig zunehmende Vielfalt innovativer Methoden in der Friedens- und Konfliktforschung zu integrieren, dürfte kaum an den

[2] Im Standardwerk „Sozialwissenschaftliche Konflikttheorien liefert Bonacker einen Einblick über die thematische Vielfalt der Konflikttheorien: In der politischen Philosophie, Ökonomie, Anthropologie, Psychologie, in der klassischen Soziologie, in den Gendertheorien, in der internationalen Politik, in den Rational-Choice-Theorien, in den neueren Sozialtheorien und in der Systemtheorie (vgl. Bonacker 2005).

[3] **Prof. Dr. Johan Galtung** ist einer der Gründerväter der Friedens- und Konfliktforschung. Er lehrte als Honorar- und Gastprofessor an über 50 Universitäten und vermittelte weltweit in über 100 Konflikten. Er ist Direktor des TRANSCEND-Netzwerks und Begründer der TRANSCEND-Methode (vgl. Graf/Kramer 2004).

[4] **Prof. Dr. Friedrich Glasl** studierte politische Wissenschaften und dissertierte über internationale Konfliktverhütung. Er ist Mitbegründer der „Trigon Entwicklungsberatung“ und arbeitet sowohl als Dozent an der Universität Salzburg als auch als Berater in Konfliktmanagement und Mediation (vgl. Graf/Kramer 2004).

Beiträgen von Glasl und Galtung vorbeikommen. Bislang sind aber nur unzureichend Versuche unternommen worden, die Ansätze von Galtung und Glasl in einem entsprechenden Zusammenhang zu diskutieren, insbesondere bezüglich ihrer besonderen Schnittstellen und Ergänzungspunkte.

Der sog. „Integrale Ansatz“ (künftig: IA) des viel gelesenen amerikanischen Philosophen Ken Wilber[5] könnte hierzu einen wertvollen Beitrag leisten, einen Schritt aus der Friedens- und Konfliktforschung zurückzutreten und am Beispiel der Ansätze von Glasl und Galtung einen konzeptionellen Vorschlag zur Metatheoriebildung zu liefern. Mit seiner vielschichtigen Kombination „horizontaler“ und „vertikaler“ Kategorisierungsdimensionen erweist sich Wilbers ambitionierte Theorie als umfassender als alle anderen in der Friedens- und Konfliktforschung anerkannten Ansätze.

Theoretische und normative Grundannahmen

Die *theoretische* Bedeutung von Wilbers Ansatz für diese Untersuchung begründet sich auch mit der Annahme, dass der Epistemologie (=Erkenntnistheorie) eine besondere Bedeutung in der Metatheoriebildung zukommt. Übertragen auf die Konfliktforschung spiegelt sich diese These in der Prämisse wider, dass 1) alles Leben Konfliktbewältigung ist (Handlung), aber 2) jede Akteurshandlung eine Strategie birgt, die aus seinem Wahrnehmungsrahmen bzw. seinen erkenntnistheoretischen Vorannahmen über seine Bezugswelt resultiert. In seinem letzten Werk „Alles Leben ist Problemlösen“ (2004) nannte der Wissenschaftsphilosoph Karl Popper diese (un-)bewussten hypothetischen Vorannahmen eines jeden Akteurs „Erwartung“ (vgl. ebd., S. 16). Eine integrativer Ansatz der Konfliktbearbeitung müsste demnach am Bereich der „Annahmenbildung“ oder spezifischer: der Epistemologie, ansetzen. Da hierin ein wesentlicher Schwerpunkt des IA besteht, liegt ihr weiterer Nutzen für diese Arbeit begründet.

Für die Metatheoriebildung in der Friedens- und Konfliktforschung bedeutet dies aber auch, dass mindestens zwei Kontexte zu unterscheiden sind, nämlich der „erkenntnistheoretischen Annahmenbildung“ (hier: Epistemologie) und der „problemorientierten Handlung“. Den letzteren Kontext bezeichne ich als „Heuristik“, worunter ich Regelbildungen verstehe, die Lagebeurteilungen, Entscheidungsfindungen und Problemlösungen in komplexen Situationen gewährleisten sollen. Beide Kontexte bauen, wie oben beschrieben, aufeinander auf, scheinen aber auch unterschiedliche Erfordernisse der Metakategoriebildung zu implizieren.

Darüber hinaus folgt die vorliegende Arbeit der *normativen Grundannahme*, dass eine nachhaltige Konfliktbearbeitung erstrebenswert ist und nur durch Methoden erfolgen kann, die auf einem tiefen Ansatz des Dialogs fußen. Im Rahmen der konstruktiven Konfliktbearbeitung stellt der Dialog den Königsweg zu einer tieferen, kreativeren und empathischeren Lösungsfindung dar. Die Untersuchung beschränkt sich daher thematisch vorwiegend auf die Integration von Methoden der konstruktiv-dialogischen Konfliktbearbeitung. Die Methode von Galtung deckt hierbei den Bereich der Konflikttransformation, der Ansatz von Glasl den Bereich des Konfliktmanagements ab. Auf die Methode der Konfliktregelung oder direktivere Maßnahmen der (gegebenenfalls militärischen oder juristischen) Gewalteindämmung wird im Rahmen dieser Arbeit nicht eingegangen.

---

[5] **Kenneth („Ken“) Earl Wilber Jr.** (* 31.01.1949 in Oklahoma City, Oklahoma, USA) studierte ab 1968 Biologie, Chemie, Biophysik und Biochemie. Sein Interesse an den östlichen Weisheitslehren und westlichen Geisteswissenschaften trug dazu bei, dass er die akademische Laufbahn frühzeitig beendete, um sich diesen Themen im Selbststudium intensiv zuzuwenden. Sein erstes Buch hatte Wilber als Manuskript bereits im Jahre 1973 („Das Spektrum des Bewusstseins“) fertig gestellt; sein Hauptwerk („Eros, Kosmos, Logos“) 1995 veröffentlicht. Inzwischen hat Ken Wilber über 20 Bücher herausgegeben, die in bis zu 30 Sprachen übersetzt worden sind. Er lehrt gelegentlich am Naropa-Institut in Boulder, Colorado, wo auch derzeit das von ihm 1998 gegründete Integrale Institut steht. Es umfasst heute etwa 400 Mitglieder (vgl. Integrales Forum 2007).

Vorgehensweise der Untersuchung

Unter diesen oben genannten Gesichtspunkten stellen sich folgende Kernfragen, die es im Rahmen der Untersuchung zu beantworten gilt:

- (Wie) lassen sich – am Beispiel der Methoden von Glasl und Galtung – unterschiedliche Methoden dialogischer Konfliktbearbeitung epistemologisch und heuristisch auf der Basis des IA kategorisieren und integrieren?
- Worin bestehen hierbei die Grenzen, Möglichkeiten und Erweiterungspotenziale des IA in seiner Anwendung auf die Friedens- und Konfliktforschung?

Diese Fragen im Hinterkopf behaltend, gliedert sich das Forschungsvorhaben wie folgt:

- In einem deskriptiven Teil werden die Ansätze von Glasl, Galtung und Wilber, auf denen diese Untersuchung aufbaut, möglichst prägnant vorgestellt.
- Danach wird mit Hilfe der Kategorisierungsinstrumente des IA eine Möglichkeit aufgezeigt, die Methoden von Glasl und Galtung bezüglich ihrer theoretischen Bezugspunkte epistemologisch zu verorten und in einem gemeinsamen Zusammenhang zu integrieren.
- Darauf aufbauend, wird auf Gemeinsamkeiten und Ergänzungspunkte praxisbezogener Kategorien der metatheoretischen Ansätze von Glasl und Galtung eingegangen, die nicht von Wilbers IA abgedeckt werden. Im Rahmen dieses heuristischen Metakontexts soll vor allem auf die Grenzen und Erweiterungspotenziale des IA eingegangen werden.
- Danach erfolgt eine Darstellung der Herausforderungen in der Metatheoriebildung im Allgemeinen sowie in der Friedens- und Konfliktforschung im Besonderen.
- Die Ergebnisse werden abschließend in einem Fazit zusammengefasst.

Kurzdarstellung der Methoden von Glasl, Galtung und Wilber

Konfliktmanagement nach Friedrich Glasl

Im Konfliktmanagement-Ansatz von Friedrich Glasl definiert er den „Konflikt“ als eine Interaktion zwischen mindestens zwei Akteuren, in der mindestens ein Akteur eine Unvereinbarkeit im Wahrnehmen, Fühlen, Denken, Wollen mit dem anderen Akteur in der Art erlebt, dass beim Verwirklichen dessen, was der Akteur fühlt, denkt oder will eine Beeinträchtigung durch einen anderen Akteur(e) erfolgt (vgl. Glasl 2004a, S. 17). Der soziale Konflikt beginnt also nicht mit den Unvereinbarkeiten, sondern mit der Art und Weise der Austragung (vgl. Glasl 2004b).

In Glasls Ansatz sind zwei Grundkriterien für die Konfliktbearbeitung von Bedeutung: Einerseits werden allgemeine *Komponenten und Ansatzmomente*, andererseits konkrete *Situationsmerkmale* in der Intervention unterschieden.

Generelle Komponenten und Wirkungsrichtungen der Interventionen

Glasl unterscheidet *sechs seelische Hauptfaktoren*, die in ihrer Wechselwirkung zur Eskalation oder Fixierung der Konflikte beitragen und damit als Ansatzpunkte für gezielte Interventionen dienen (vgl. Glasl 2004a, S. 39f.). Der Schwerpunkt der Intervention verlagert sich dabei je nach Eskalationsgrad (siehe unten).

Bei niedrigen Eskalationen: Perzeptions- und denkensorientierte Interventionen:

1. *Perzeptionen*: Vorurteile der Parteien abbauen etc.
2. *Gedanken, Vorstellungen, Erinnerungen, Interpretationen*: Die Parteien werden über den Einfluss ihrer Begrifflichkeiten und Deutungen auf den Konflikt gemacht (vgl. Glasl 2004a, S. 318-325).

- Bei mittleren Eskalationen: Auf Gefühle und Einstellungen gerichtete Interventionen:
- *Gefühle und Einstellungen*: Gefühle der Feindseligkeit etc. überwinden und wieder Vertrauen zueinander fassen.
- *Willensfaktoren (Triebe, Motive, Intentionen)*: Die eigenen Absichten reflektieren; Ziele und Mittel neu überdenken etc. (vgl. ebd., S. 325-341).
- Bei hohen Eskalationen: Verhaltens-orientierte Interventionen:
- *Äußeres Verhalten*: Das unkontrollierte destruktive Verhalten wieder in konstruktive Bahnen leiten; Gewalthandeln reduzieren etc.
- *Konfliktfolgen*: Verantwortung für die unbewussten Folgen des eigenen Tuns übernehmen etc. (vgl. Glasl 2004a, S. 341-347).

Neben sechs seelischen Hauptfaktoren berücksichtigt Glasl in der Konfliktdiagnose fünf Dimensionen, die für die Strategie der Konfliktbehandlung unterschiedliche Wirkungsrichtungen vorgeben. Ein umfassender Ansatz müsste jedoch alle enthalten (vgl. Glasl 2004a: 349-380). Die folgende Tabelle stellt die fünf Dimensionen der Konfliktanalyse mit den sechs seelischen Hauptfaktoren in Beziehung:

Tab. 1: Beispiele für die Überschneidung von Interventionsansätzen (Glasl 2004a: 381)

	Issues	**Konflikt-verlauf**	**Parteien intern**	**Beziehungen zwischen den Parteien**	**Grundeinstel-lungen**
Perzeptionen und Denken	Issues definieren, transponieren	Konflikt-partitur, Eskalations-prognose	Erkennen des Rollentypus, Analyse der Vertreter-beziehungen, Denkmal	Analyse der Rollenbilder, imaginäres Eskalieren und De-Eskalieren der Abhängigkeiten	Evaluieren der Grundauffassungen von Konfliktlösungs-bemühungen

Gefühle und Einstellungen	Issue-Empathie, Issues flexibilisieren	Mikro-Analyse kritischer Entscheidungsmomente	Lebendiges Soziogramm	Imaginärer Monolog, kleine Kreditangebote	Externe Situation ambivalent machen, Strategie-Kalkül beeinflussen
Wollen	Issues flexibilisieren, transponieren	Trend-Extrapolation, Kreditangebote, GRIT[6]	Rollenverhandeln	Rollenverhandeln, Rollenvertrag	Ziele-Mittel-Klärung, Un-Werte klären
Verhalten	Verhaltensbegrenzung	Status-quo-Regelung	Rollenverhandeln, interne Informationsstrategie für Status-quo-Abkommen; Verhandlungsinstruktionen	GRIT-Taktik, Rollenverhandeln, Spielregeln, kontrollierte Kommunikation	Rückkehr zu Konfliktregulatoren, verbessern der Spielregeln

Indikatoren für eine flexible Strategie- und Rollenwahl

Vier Indikatorenbereiche sind für die Strategie- und Rollenwahl bei der Konfliktbearbeitung von entscheidender Bedeutung. Diese umfassen:

– Aktueller *Eskalationsgrad*: niedrig, mittel, hoch
– *Konflikttypus*: Dominante Erscheinungsformen, Soziale Arena, Reichweite der Konflikte
– *Rahmenvorgaben* der Konfliktbearbeitung: Ressourcen, Grenzen etc.
– Kulturelle, gesetzliche und wirtschaftliche *Rahmenbedingungen* (vgl. Glasl 2004b)

Die Indikatoren „Eskalationsgrad" und „Konflikttypus" stellen hierbei die bekanntesten Konzepte in Glasls Theorie dar. Die folgende Darstellung wird sich daher nur auf diese beiden Indikatoren beschränken.

Aktueller Eskalationsgrad

Glasl zufolge erfolgt die Konflikteskalation abrupt und stufenweise. Da diese mit einem Übergang zu einer gewaltsameren Austragung und einem Rückgang des Bewusstseins (Ich-Kraft) der Konfliktparteien einhergeht, werden die Eskalationsstufen auch als „Regressionsschwellen" bezeichnet (vgl. Glasl 2004a, S. 234, 304f.):

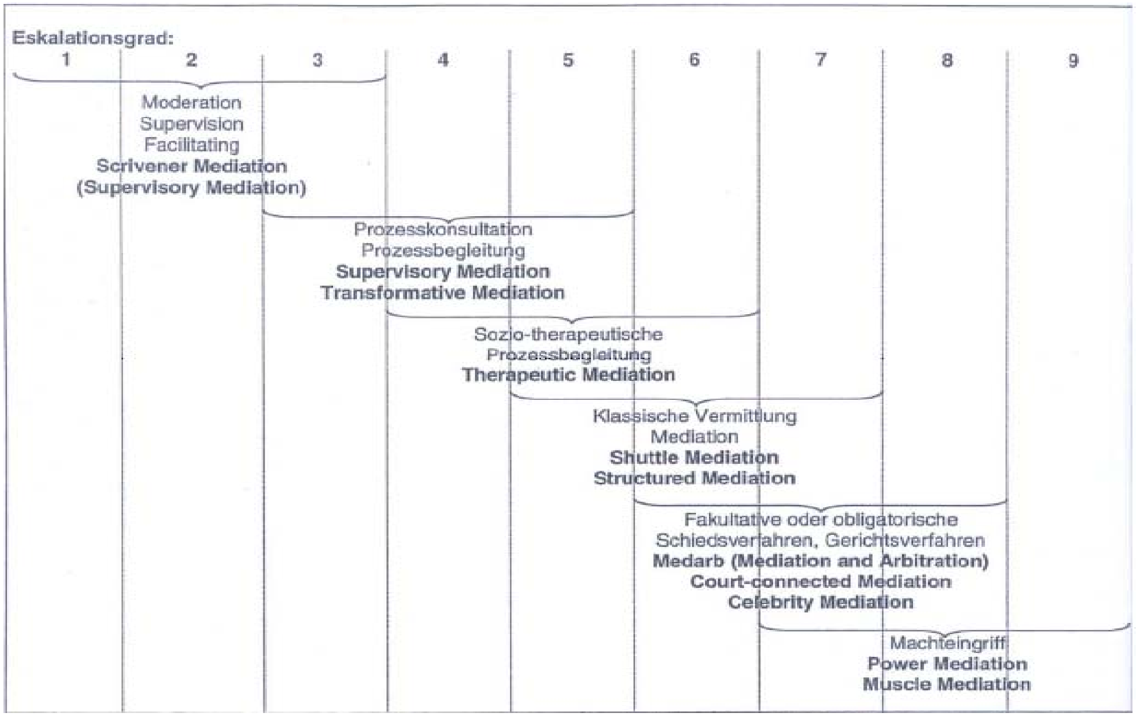
Vernichtung zum Preis der Selbstvernichtung

Grafik 1: Die Hauptfaktoren der neun Eskalationsstufen (Glasl 1999, 2003a; vgl. hierzu auch 2004a, S. 236f.)

- Die vielen Eskalationsstufen stehen für Wahrnehmungsebenen, in denen es den Konfliktparteien unterschiedlich leicht fällt, eigene Ideen in die Lösungssuche einzubringen. Daher muss die Interventionspartei eine umso direktivere Rolle einnehmen, je weiter der Konflikt eskaliert ist (vgl. Glasl 1999, S. 364-404). Wenn sich die Konfliktparteien auf ungleichen Stufen erleben, ist bei der Wahl der Interventionsstrategie die höhere Stufe maßgeblich (vgl. Glasl 2003b, S. 298).
- Bei einer *geringen Eskalation* (Stufen 1-3) geht es darum, die vorhandenen Selbstheilungskräfte der Konfliktparteien zu stimulieren und zu initiieren. Hierzu bieten sich Ansätze wie das Facilitating, Moderation, Supervision und der Scrivener Mediation an (vgl. Glasl 2004a, S. 404-408).
- Bei einer *mittleren Eskalation* (Stufen 4-6) können die Parteien den Konflikt nicht aus eigener Kraft lösen. Hierbei sind Interventionen geboten, die die Entwicklung von gegenseitiger Empathie fördern und Selbst- und Fremdbilder auflösen. Dazu zählen Ansätze der Supervisory Mediation und der Prozesskonsultation (bis Stufe 5) oder der sozio-therapeutischen Prozessbegleitung (bis Stufe 6). Bei einer höheren Eskalation (bis Stufe 7) wird mittels Shuttle Mediation auf Kompromisslösungen hingearbeitet (vgl. ebd., S. 408-425).

- Die *hohe Eskalation* (Stufen 7-9) wird durch eine gewalttätige Konfliktaustragung geprägt. Hier geht es bei der Konfliktintervention um Schadensbegrenzung durch Verhaltenskontrolle. Hierzu eignet sich das Schiedsverfahren (bis Stufe 7) oder/und der Eingriff einer überlegenen Machtinstanz (Stufe 8 und 9) (vgl. ebd., S. 428-435).

Das sich hieraus ergebende Spektrum von Interventionsansätzen, die an die jeweilige Eskalationsstufe angepasst sind, wird durch die vorliegende Grafik schematisiert:



Eskalationsgrad:

Court-connected Mediation
Celebrity Mediation
Machteingriff
Power Mediation
Muscle Mediation

Grafik 2: Spektrum von Interventionsansätzen nach Eskalationsgrad (Glasl 2004a, S. 397)

Die Überschneidungen bei den Interventionsansätzen resultieren aus der Unterscheidung zwischen sog. „kalt“ und „heiß“ ausgetragenen Konflikten: Kalte Konflikte bedürfen schon bei niedrigeren Eskalationsstufen eines Übergangs zum nächsten Interventionsansatz (vgl. Glasl 2004b).

Konflikttypus

Kalte Konflikte weisen eine äußerlich beherrschte, indirekte, verdeckte und weitgehend formgebundene Austragung auf. Heiße Konflikte implizieren hingegen eine direkte, offene, emotionale, weitgehend formfreie Auseinandersetzung. Beide Austragungsformen können durch bestimmte Ereignisse in sog. heißen und kalten „Phasen“ einander abwechseln (vgl. Glasl 2004a, S. 77-84). Ab der Eskalationsstufe 6 bestehen keine nennenswerten Unterschiede mehr zwischen heißer und kalter Austragungsform (vgl. Glasl 2004a, S. 304).

Tendenziell sieht die Konfliktbehandlung von heißen (überhitzten) Konflikten de-eskalierende Strategien vor (z.B. Entschleunigung durch Begrenzen von Themen, Personen, Zeit etc.), während die Behandlung von kalten (unterkühlten) Konflikten hingegen eskalierende Strategien (z.B. emotionale Äußerungen stimulieren) impliziert (vgl. 2003, S. 293).

Die Interventionen, die an die Konflikttypen „Eskalationsgrad“ und „Austragungsform“ angepasst sind, lassen sich in mindestens vier Dimensionen zusammenfassen und wie folgt miteinander in Beziehung setzen: „Präventiv“ und „kurativ“ nehmen dabei Bezug auf die Konfliktphase und „eskalierend“ und „de-eskalierend“ auf die Austragungsform.

Tab. 2: Vier Interventionsrichtungen (vgl. Glasl 2004a, S. 316)

	De-eskalierend (heißer Konflikt)	**Eskalierend (kalter Konflikt)**
Präventiv	Um Kommunikationsproblemen vorzubeugen, werden Informationsspielregeln vereinbart; Training in Kommunikationsmethoden.	In Anwesenheit des Beraters werden Sorgen, Ängste, Unterstellungen gezielt angesprochen; Konfrontationssitzung um zu vermeiden, dass ein beginnender Konflikt kalt gemacht wird.
Kurativ	Der Konfliktverlauf wird rekonstruiert und geklärt; Die Konfliktparteien klären ihre unterschiedlichen Perzeptionen des Verhaltens.	Bestehende kalte Konflikte werden durch Rollenspiele dramatisiert, übertrieben; Ein Interessenvertreter ermutigt seine Klienten sich stark für ihre Standpunkte einzusetzen.

Konflikttransformation nach Johan Galtung

Johan Galtungs Konflikttransformations-Ansatz besticht vor allem durch seine sehr umfassende, „dreifaltig“ aufbereitete, Theorie von Gewalt, Konflikt und Frieden:

Theoretische Grundlagen

Im Rahmen seiner *Konflikttheorie* unterscheidet Galtung die wechselwirksamen Komponenten Widerspruch (contradiction), Annahmen/Einstellungen (attitude) und Verhalten (behaviour). Ersteres definiert er als miteinander unvereinbare Ziele mindestens zweier Akteure (Disput) oder innerhalb eines Akteurs (Dilemma). Dieser Widerspruch bestimmt den Inhalt des Konflikts. Die Komponente der Annahmen/Einstellungen umfasst den epistemischen Inhalt, nach denen die Akteure den Konflikt bewerten. Beide Komponenten bilden die latente (unbewusste) Seite eines Konflikts und prägen sich in der manifesten Seite des Konflikts – dem Konfliktverhalten aus. Wenn ein Ziel durch etwas als versperrt empfunden wird, kann der Widerspruch als Frustration erlebt werden, was zu einer aggressiven Einstellung und einem aggressiven Verhalten führen kann. So reproduziert sich das Konfliktdreieck als Gewaltspirale (vgl. Galtung 1998, S. 135f.).

Gewalt definiert Galtung „als die Ursache für den Unterschied zwischen dem Potentiellen und dem Aktuellen, zwischen dem, was hätte sein können, und dem, was ist.“ (Galtung 1975, S. 9). Die drei Eckpunkte von Galtungs Konfliktdreieck haben ihre Entsprechungen in einem Gewaltdreieck:

- Die *strukturelle Gewalt* entspricht dem Widerspruch im Konfliktdreieck. Sie umfasst ausbeuterische Mechanismen, die eine Herrschaftselite befähigen, Macht über Andere auszuüben (vgl. Galtung 2000, S. 117f.).
- Die *kulturelle Gewalt* bildet eine religiös-ideologische Legitimierungsgrundlage direkter und struktureller Gewalt und bewirkt verzerrt-polarisierende kollektive Einstellungen bei den Akteuren (vgl. Galtung 2000, S. 119f.).
- Die *akteurszentrierte Gewalt* wird von den beiden subtilen Gewaltformen begünstigt und manifestiert sich in einem aggressiven Verhalten (vgl. Galtung 2000, S. 115f.).
- Ein großer Teil von Gewaltzusammenhängen wurzelt in seinen *Tiefendimensionen*:
- Die strukturelle Gewalt erwächst aus *Tiefenwidersprüchen* innerhalb der unbewussten Beziehungsmuster unterschiedlicher Gesellschaftssegmente. Hierunter können folgende Trennlinien unterschieden werden:
- Umwelt: Mensch vs. Natur.
- Gender: Männlich vs. Weiblich (Sexismus).
- Generation: Alte vs. „Erwachsene“ vs. Junge.
- Hautfarbe: Hell vs. Dunkel (Rassismus).
- Klasse: Mächtige vs. Ohnmächtige (a) politische Macht: wer entscheidet über/unterdrückt wen? (b) Militärische Macht: wer marschiert wo ein/okkupiert wen? (c) Ökonomische Macht: wer beutet wen aus? (d) Kulturelle Macht: wer durchdringt/konditioniert/entfremdet wen?
- Normales vs. Abweichendes (Stigmatisierung).
- Nationalität („Ethnie“) / Kultur (Religion) / Zivilisation: Dominante vs. Dominierte (Nationalismus, Fundamentalismus).
- Territorium: Staatenwelt, Zentrum vs. Peripherie (Zentralismus). Der strukturellen Gewalt liegt eine Pathologie zugrunde – das sog. „*PSFM*-Syndrom“: Das Machtungleichgewicht der besagten Trennungslinien beinhaltet *P*enetration (als Gegenteil von Autonomie), *S*egmentation (Gegenteil: Integration), *F*ragmentation (Gegenteil: Solidarität), *M*arginalisation (Gegenteil: Partizipation) (vgl. ebd., S. 117f.).
- Die gesamte Kultur (Religion und Ideologie, Sprache und Kunst, Wissenschaft) ist von tiefenkulturellen Programmierungen durchzogen, die direkte und strukturelle Gewalt legitimieren. Das emotionale „MMT-Syndrom“ impliziert Mission (Sendungsbewusstsein), Mythos (Auserwähltsein) und Trauma (Verletzungen von Feinden). Das kognitive „DMA-Syndrom“ ist von Dualismus (wir vs. sie), Manichäismus (gut vs. böse), und Armageddon (ein letztes alles entscheidendes Ereignis) gekennzeichnet. (vgl. Graf/Bilek 2003, S. 308f.).
- Die Tiefendimension akteurszentrierter Gewalt resultiert aus der Nichterfüllung von Grundbedürfnissen: Überleben, Wohlbefinden (beide physisch), Identität und Freiheit (beide psychisch). Diese Bedürfniskategorien sind universal, gleichwertig und können von allen drei Gewaltarten bedroht sein (vgl. ebd., S. 308).
- Gewalt ist nicht mit Konflikt identisch, allerdings impliziert Gewalt immer einen zugrundeliegenden Konflikt. Der Konflikt birgt aber stets die Möglichkeit zum kreativen

und konstruktiven Umgang. Frieden steht hierbei für die Fähigkeit, „einen Konflikt mit Empathie, Gewaltfreiheit und Kreativität“ anzugehen und dabei den Konflikt in seinen drei Manifestationsbereichen zu behandeln (vgl. Galtung/Tschudi 2003, S. 9f.). Konkret bedeutet Galtungs Friedenstheorie:

- Bei der strukturellen Gewalt müssen durch die Förderung von Kreativität die Begrenzungen der Trennlinien überwunden werden.
- Bei der direkten Gewalt muss Gewaltfreiheit aufgebaut werden, indem die Grundbedürfnisse aller Parteien respektiert und befriedigt werden.
- Bei der kulturellen Gewalt muss durch die Förderung von Empathie eine Transformation der destruktiven Kulturelemente angestrebt werden (vgl. Graf/Bilek 2003, S. 310).

Für die Bearbeitung gewalttätiger Konflikte bedeutet die Schaffung von Frieden konkret die Vermeidung (Prävention) und Reduzierung (Heilung) von Gewalt und die Umleitung der Konfliktenergie in eine positive Richtung (Transformation).

Konfliktintervention im Konfliktlebenszyklus

Bei gewalttätigen Konflikten richtet sich die Konfliktintervention im Idealfall nach dem *Lebenszyklus des Konfliktes*. Sofern nicht unterbrochen, sind drei Phasen zu unterscheiden, die aufeinander folgen: (a) vor der Gewaltanwendung, (b) während der Gewaltanwendung und (c) nach der Gewaltanwendung (vgl. Galtung 2000, S. 13f.).

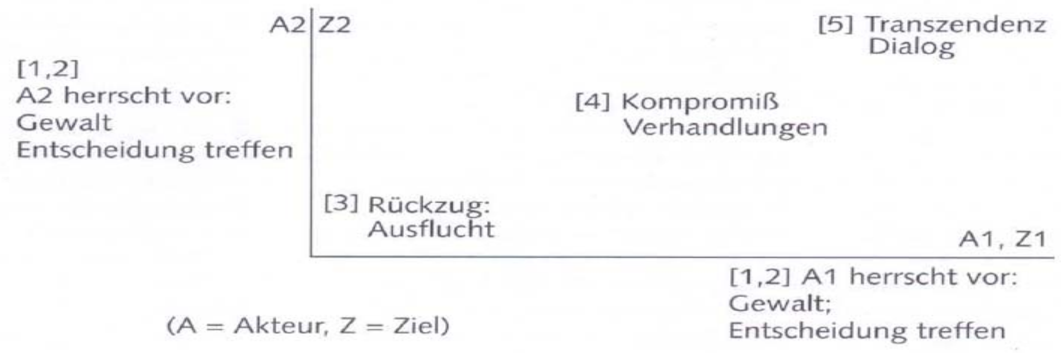
Im *Phase I*, also vor dem Ausbruch der Gewalt, gilt es vorbeugend auf Gewalt legitimierende Kulturen, repressive Strukturen, und gewalttätige Akteure einzuwirken.

- Ausbeutende Strukturen gilt es gemeinsam zu reflektieren, Friedensstrukturen gemeinsam einzuführen.
- In den Konfliktkulturen müssen konstruktive Elemente herausgefunden, gefördert und eingeführt werden.
- Gewalttätige Akteure müssen identifiziert und in Dialogen über sämtliche Aspekte ihrer Situation mit einbezogen werden (vgl. Baros/Jaeger 2003, S. 232).
- In der *Ausbruchsphase (Phase II)* gilt es zuerst die Gewalt zu stoppen, weil sie den zugrundeliegenden Konflikt schwerer erkennbar macht (Friedenssicherung). Nur dies rechtfertigt eine polizeilich-militärische Konfliktintervention (vgl. Galtung/Tschudi 2003, S. 18). Es existieren fünf Möglichkeiten, um direkte Gewalt gewaltlos zu beenden: (a) Waffen- und Söldnerembargos; (b) Evakuierung von Zielen; (c) Demoralisierung von Soldaten; (d) Hervorhebung der Tatsache, dass langfristig wegen der Gewaltspirale alle Parteien verlieren werden und (e) eine „drastisch erhöhte“ Anzahl von Friedenstruppen, die den Kombattanten den Raum zum Kämpfen nimmt (vgl. Galtung 2000, S. 18f.). Danach erfolgen dieselben Maßnahmen wie bei Phase III (vgl. Galtung/Tschudi 2003, S. 12).

Nach dem Ende der Gewalt in *Phase III* können die Maßnahmen zur Heilung eingeleitet werden, die synchron vorangetrieben werden sollten. Dies beinhaltet die gemeinsame Konfliktlösung, den Wiederaufbau reversibler Schäden (z.B. Rehabilitation, Friedensstruktur und -kultur) und Versöhnung (z.B. Reparation, Vergeben, Reue, Rechtsprechung, Wahrheitskommission, Theater, gemeinsamer Kummer) (vgl. Galtung 2000, S. 20)

Konfliktbewältigung durch Konflikttransformation

Im Groben können fünf Möglichkeiten der Konfliktbewältigung unterschieden werden:



A2 Z2
[5] Transzendenz Dialog
[1,2] A2 herrscht vor: Gewalt Entscheidung treffen
[4] Kompromiß Verhandlungen
[3] Rückzug: Ausflucht
A1, Z1
[1,2] A1 herrscht vor: Gewalt; Entscheidung treffen
(A = Akteur, Z = Ziel)

Grafik 3: Möglichkeiten zur Konfliktbewältigung (Galtung 2000, S. 21)

- Eine Partei herrscht vor: Der Konflikt wird mit Einsatz von Machtmitteln (physischer Gewalt (1) oder verbal (2)) entschieden. Bei beiden „Lösungen“ bleibt jedoch die kulturelle und strukturelle Gewalt unberücksichtigt (vgl. Galtung 2000, S. 21f.).
- Rückzug (3): Ausflucht als Prozess: Die Beteiligten geben ihre Ziele (vorübergehend oder für immer) auf (vgl. Galtung 1998, S. 178).
- Kompromiss (4): Verhandlung als Prozess: Konfliktregelung erfolgt durch die klassische Mediation (vgl. Galtung/Tschudi 2003, S. 83-86). Die Kompromisslösung ergänzt die gewaltlose Konfliktlösung (2) um den Aspekt der rationalen Emanzipation (vgl. Galtung/Tschudi 2003, S. 86). Die Beteiligten müssen sich aber hinsichtlich ihrer Ziele (Z1 und Z2) mäßigen (vgl. Galtung 1998, S. 178).
- Transzendenz (5): In dieser Bewältigungsstrategie wird darauf abgezielt, eine neue Konfliktrealität erschaffen, welche ein „Sowohl-als-auch“ (und gegebenenfalls „Darüber-hinaus“) der widersprüchlichen Ziele ermöglicht. Der Königsweg hierzu ist der Dialog (vgl. Galtung 2000, S. 21f.).

Unter all den Möglichkeiten der Konfliktbewältigung ist die Konflikttransformation langfristig vorzuziehen. Sie fußt auf einer spezifischen *Dialog-Methode*.

Der Transcend-Dialog basiert im Wesentlichen auf den Eins-Eins-Dialog mit den Konfliktparteien. Der Zweck besteht darin, die Parteien zu befähigen, selbst zu einer kreativen Lösung ihres Konfliktes zu kommen (vgl. Galtung/Tschudi 2003, S. 194f.). Hierzu werden im Dialog die fixierten Positionen und Perzeptionen kognitiv ausgeweitet und die gegenseitige Empathie erhöht. Der Schlüssel liegt in der Einführung von *negativen* (z.B. „Wie könnte der Konflikt im schlimmsten Fall weiterverlaufen, wenn sich nichts ändert?“) und *positiven „Ankern“* (z.B. „Was hätte man damals anders machen können?“ oder „Was wäre eine für alle Parteien optimale Konfliktlösung?“) (vgl. ebd., S. 203-208). Der Verlauf des Dialogs orientiert sich zyklisch an den folgenden vier Prozessen, welche jeweils einen vergangenheits- und zukunftsbezogenen positiven und negativen Anker beinhalten:

1) *Träume*: Festlegung einer gemeinsamen konstruktiven Zukunftsvision;
2) *Trauma*: Diagnose der destruktiven Aspekte der Vergangenheit;

3) *Ruhm*: Diagnose der positiv-nostalgischen Aspekte der gemeinsamen Vergangenheit;
4) *Ängste*: Negativprognose (vgl. Galtung 2008, S. 83, 225f.).

Der Integrale Ansatz nach Wilber

Der IA basiert auf der Grundannahme, dass eine menschliche Einsicht nie zu 100% falsch sein kann, in der Regel aber auch immer nur begrenzt wahr („partially true“) ist. Trotz ihrer Qualitäten, ein größtmögliches Maß dieser vielen „Teilwahrheiten zu integrieren, räumt aber Wilber ein, dass der Anspruch einer sog. „Theorie von Allem“ an sich unlösbares Unterfangen ist, da das Wissen schneller zunimmt als die Möglichkeiten, es nach Kategorien zu ordnen. Vollständiges Streben nach Ganzheitlichkeit bleibt damit ein sich „uns immer wieder entziehender Traum“ (vgl. Wilber 2001a, S. 10).

Methodologie

Die Herangehensweise des IA wird vom Konzept metatheoretischer Kategorienbildung durch sog. *Orientierungsverallgemeinerungen* geprägt. Diese bezeichnen umfassende und allgemeine Grundthemen in allen Wissensgebieten, über die nach Wilber kaum Uneinigkeit besteht (vgl. Wilber 1997, S. 37f.). Wissenschaftlich begründet Wilber seine Methodologie mit den sog. *„drei Strängen jeder sinnvollen Wissenssuche*“, die er unter anderem von Thomas Kuhns berühmten Werk „Struktur wissenschaftlicher Revolutionen“ (ders. 1988) abgeleitet hat (vgl. Wilber 2002a, S. 339-341):

1. *Injunktion*: Der Wissenschaftler führt eine festgelegte Handlungsanweisung (Paradigma) durch, um vergleichbare Daten zu gewinnen;
2. *Datengewinnung*: Das erfolgreiche Experiment enthüllt Daten, die vom Forschenden wahrgenommen und gesammelt werden.
3. *Falsifikation*: Diese Daten werden mit und durch andere Menschen verglichen, die die gleiche Injunktion angewendet haben (vgl. Wilber 2001a, S. 88-91).

Diese universellen Schritte der Erkenntnisgewinnung sind gleichsam auf einen „eng“ und einen „weit gefassten“ Wissenschaftsbegriff anwendbar:

- Unter ersterem fallen die naturwissenschaftlichen Disziplinen, die auf der empirischen Beobachtung der materiellen Welt fußen (z.B. Physik).
- Unter die „weite“ Wissenschaft fallen die Geisteswissenschaften, basierend auf Kommunikation/Interpretation (mit) der intellektuellen Welt (z.B. Hermeneutik), aber auch spirituelle Praktiken (z.B. Meditation) (vgl. Wilber 2002a, S. 339f.).

Der IA unterscheidet fünf wesentliche Untersuchungsdimensionen: (a) Quadranten, (b) Ebenen, (c) Linien, (d) Typen, (e) Zustände. Sie werden in einem sog. AQAL-Modell (All Quadrants All Lines) schematisiert.

Quadranten

Die Quadrantendimension trägt der Orientierungsverallgemeinerung Rechnung, dass alle wesentlichen Sprachen der Menschheit Fürworte der ersten, zweiten und dritten Person haben (ich, Du/wir, und es). Da nach Wilber diese drei Grundperspektiven bereits in vielen Formen von verschiedenen Denkern berücksichtigt wurden, nennt er sie „die Großen Drei“[7]. Aus diesen drei Perspektiven, die in der „Ich“-, „Wir“ (=„Ich“+„Du“)- und „Es“-Sprache codiert sind, differenziert Wilber IA noch eine vierte, interobjektive Perspektive („Es“ Plural) aus. Damit unterscheidet er insgesamt eine subjektive („Ich“), objektive („Es“), intersubjektive („Wir“) und eine interobjektive Perspektive („Es“ Plural). Diese vier Realitätsbereiche bzw. Perspektiven („Quadranten“) ko-existieren wechselwirkend und lassen sich nicht aufeinander reduzieren (vgl. unter anderem Wilber 2002a, S. 187).

Vier Geltungskriterien

Die Nichtreduzierbarkeit aller Quadranten beruht unter anderem auf ihren unterschiedlichen Geltungskriterien:

- *Individuell-objektiv (Quadrant oben-rechts): Propositionale Wahrheit*: „Wahrheit“ ist repräsentational, d.h. sie ist objektiv nachweisbar. Dabei wird eine Aussage (Proposition) gemacht, die etwas in der konkreten Welt bezeichnet oder repräsentiert (z.B.: „Draußen regnet es“) (vgl. Wilber 1997, S. 145f.). Erfasst wird dieser, in der „Es“-Sprache codierte, Quadrant z.B. von naturwissenschaftlichen und behavioristischen Methodologien.
- *Individuell-subjektiv (Quadrant oben-links): Wahrhaftigkeit:* Das Geltungskriterium des OL-Quadranten folgt hingegen nicht der „Wahrheit“, sondern der „Wahrhaftigkeit“ (z.B. die Aussage „Draußen regnet es“ könnte gelogen sein). Wahrhaftigkeit erschließt sich nur über die Interpretation von innerer Tiefe im (inneren oder äußeren) Dialog, nicht in der monologisch-empirischen Beobachtung. Abgedeckt wird dieser Quadrant von allen Methodologien, die in der „Ich“-Sprache codiert sind, z.B. der Psychoanalyse oder der Meditation (vgl. Wilber 1997, S. 127).
- *Kollektiv-subjektiv (Quadrant unten-links): kulturelles Passen*: Die intersubjektive „Wir“-Perspektive macht deutlich, dass sich Akteure auf eine Moral und gemeinsame Symbole verständigen, um im selben Bedeutungsraum leben zu können (vgl., S. 152-155). Dieser Quadrant umfasst vor allem ethische und hermeneutische Ansätze (vgl. ebd., S. 131f.).
- *Kollektiv-objektiv (Quadrant unten-rechts): Funktionelles Passen*: Aus der UR-Perspektive sind nicht Werte oder Bedeutungen von Bedeutung, sondern Informationsbits, Netze objektiver Prozesse, Strukturen und Systeme von Interesse (vgl. ebd., S. 155-160). Auf diesen, in der „Sie“-Sprache (Es-Plural) codierten, Quadranten wird zumeist im Rahmen systemwissenschaftlicher Betrachtungen eingegangen (vgl. ebd., S. 132.).

Grafisch lassen sich die wesentlichen Inhalte der vier Quadranten wie folgt darstellen:

---

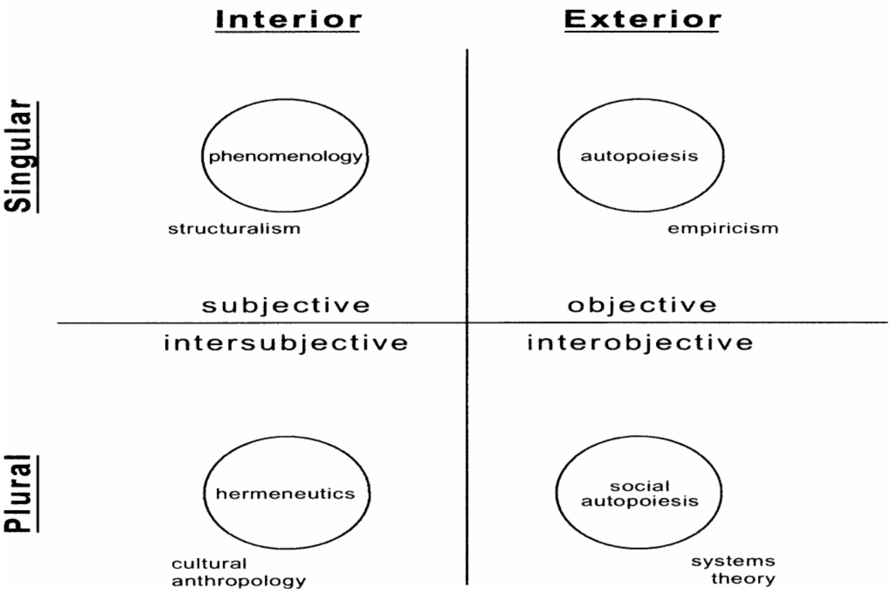
[7] Die sog. „Großen Drei“ finden sich nach Wilber z.B. in Poppers drei „Welten“ (Welt 1 [Es], Welt 2 [Ich] und Welt 3 [Wir]) in Habermas’ drei Geltungsansprüchen (Wahrheit [Objekte], Aufrichtigkeit [Subjekte], Gerechtigkeit [Intersubjektivität]) oder in Platons „Schönes“ (Ich), „Gutes“ (Wir) und „Wahres“ (Es) wieder (vgl. Wilber 2002a, S. 187).

Tab. 3: Vier Quadranten (Wilber 1997, S. 145)

	INNEN linksseitige Wege	rechtsseitige Wege AUSSEN
INDIVIDUELL	SUBJEKTIV Wahrhaftigkeit Aufrichtigkeit Integrität Vertrauenswürdigkeit ICH	OBJEKTIV Wahrheit Entsprechung Repräsentation propositional ES
KOLLEKTIV	WIR Gerechtigkeit kulturelles Passen gegenseitiges Verständnis Richtigkeit INTERSUBJEKTIV	SIE Funktionelles Passen Gewebe der Systemtheorie Strukturell/Funktionalismus Gitter sozialer Systeme INTEROBJEKTIV

Acht Horizonte

Es gibt also mindestens vier „Hauptperspektiven des In-der-Welt-Seins“ (ich, wir, es, es [plural]), von denen jede von ihrer eigenen Innenseite oder Außenseite betrachtet werden kann. Hieraus ergeben sich nach Wilber acht, welche empfindenden Wesen intrinsisch sind. Jede dieser Perspektiven hat eine natürliche Methodologie, sprich: Weisen, in denen empfindende Wesen andere empfindende Wesen berühren (vgl. Wilber 2003a: D-I). Im Kontext eines „integralen methodologischen Pluralismus“ lassen sich diese wie folgt darstellen:



Interior
Exterior
Singular
phenomenology
structuralism
autopoiesis
empiricism
subjective
objective
intersubjective
interobjective
Plural
hermeneutics
cultural anthropology
social autopoiesis
systems theory

Grafik 4: Acht Hauptparadigmen unterteilt nach Methodologien (Wilber 2003a: D-I)

Die Kriterien dieser acht Ereignishorizonte lassen sich wie folgt zusammenfassen:

- *Innen von „Ich" und „Wir":*
  - Die Untersuchung des *Innen eines „Ich"* umfasst Injunktionen wie die *Phänomenologie*, Introspektion oder Meditation (vgl. Wilber 2003a: C: II-4). Der Kernbeitrag der Phänomenologie ist die Erkenntnis, dass subjektive Erfahrungen (z.B. Träume) für sich selbst unmittelbar und unbestreitbar sind, auch wenn sie nicht in der sensorischen Wahrnehmungswelt existieren (vgl. Wilber 2003a: C: II-1).
  - Das *Innen eines „Wir"* erschließt sich durch Methodologien wie der *Hermeneutik* und der partizipatorischen Epistemologie. Im Gegensatz zur Phänomenologie schaut der Beobachter in einen Interaktionsraum voller Symbole und Regeln, deren Verständnis ihrer Bedeutungen alle betroffenen Individuen teilen. Ebenso wie das „Ich" in der Phänomenologie setzt auch das Innen des „Wir" eine persönliche Vertrautheit mit den Daten voraus (vgl. Wilber 2003a: C: III-1).
- *Außen von „Ich" und „Wir".*
  - Im Gegensatz zur Phänomenologie impliziert die Anwendung *strukturalistischer* Paradigmen, dass ein beträchtlicher Anteil ihrer deskriptiven Aspekte ohne eine persönliche Vertrautheit auf Seiten des Forschers erstellt werden können. Ein Forscher muss sich z.B. nicht meditativ transformiert haben, um transmentale Ebenen zu kartografieren. Die Methodologie des Entwicklungsstrukturalismus impliziert das Herausfiltern von allgemeinen Mustern, wie z.B. Entwicklungsstufen des Bewusstseins, durch Befragungen über längere Zeiträume hinweg (vgl. Wilber 2003a: D: III-2).
  - Das *Außen eines „Ich"* erschließt sich durch Methodologien wie dem *Entwicklungsstrukturalismus*. Dem *Außen eines „Wir"* kann man sich durch Methodologien wie z.B. der kulturellen Anthropologie oder dem *Neostrukturalismus* nähern. Dies umfasst: kulturelle Netzwerke symbolischer Interaktion, linguistische Zeichen und Symbole, semantische Bedeutungsfelder, symbolische Herrschaftsstrukturen, Regelmäßigkeiten in inter-individuellen Interaktionen etc. (vgl. Wilber 2003a: C: IV-2)
- *Innen von „Es" (Singular, Plural).*
  - Dem *Innen eines „Es" im Singular* wird durch Methodologien, wie beispielsweise der biologischen Phänomenologie und der *Autopoiesis* erfasst.
  - Das *Innen eines „Es" im Plural* erschließt sich durch Methodologien, wie z.B. der *sozialen Autopoiesis*: Hier wird die Verkettung von kommunikativen Operationen zwischen System und Umwelt beobachtet (vgl. Wilber 2003a: C: Intro-1).
- *Außen von „Es" (Singular, Plural).*
  - Die *Außendimensionen eines „Es" im Singular* lassen sich durch empirische Methodologien wie z.B. dem *Behaviorismus* erfassen.
  - Die *Außendimensionen eines „Es" [plural]* erschließen sich z.B. durch Paradigmen wie der *Systemtheorie*, der Chaos- und der Komplexitätstheorie (vgl. Wilber 2003a: C: Intro-1).

Ebenen

In Anlehnung an die Kartografien alter Weisheitstraditionen und moderner Evolutionstheorien geht der IA von Entwicklungshierarchien aus. Hierbei ist nicht die spezifische Einteilung an sich entscheidend, sondern das Hierarchieverhältnis der Daseinsbereiche zueinander. Die evolutionäre Ebenenhierarchie begründet sich nach Wilber zum einen daraus, dass die höheren Ebenen auf den Inhalten der vorangegangenen Ebenen aufbauen (Immanenz). Zum anderen stellen die höheren Ebenen gegenüber den vorangegangenen auch eine Erweiterung dar (Transzendenz). Jede Ebene, wie z.B. Körper, Geist und Seele, hat gegenüber der vorangegangenen eine tiefere, neu hinzugekommene Qualität (Emergenz) und kann nur mit den ihnen zugehörigen Begriffen erklärt werden (vgl. Wilber 2002b, S. 60-62; ausführlich hierzu: Wilber 2002a). Auch wenn die Evolution nach Wilber eine klare Richtung aufweist, verläuft sie nicht linear, sondern in spiralförmigen Fortschritts- und Rückschrittsphasen (vgl. ebd., S. 271).

Im psychologischen Kontext bildet das Ebenenmodell das Kernstück eines vielschichtigen „Akteursmodells“ und basiert unter anderem auf den Beiträgen von Sri Aurobindo, Piaget, Gebser, Maslow oder den Spiral-Dynamics (SD) von Graves, Beck und Cowan. Das Ebenenspektrum reicht von egozentrischen, über soziozentrischen und weltzentrischen, bis hin zu kosmozentrischen Bewusstseinsebenen, die die Akteurswahrnehmung und sein Handeln konstituieren. Je höher die Ebene, umso niedriger der Grad an Narzissmus und umso tiefer und umfassender der Identifikationsgrad mit immer subtileren Aspekten seiner Umwelt, aber auch umso komplexer die möglichen Pathologien (vgl. Wilber 1997, S. 183–193). Normativ impliziert ein integrales Ebenenverständnis, dass in erster Linie nicht die Dominanz höherer Ebenen gegenüber den niederen Ebenen anzustreben ist, sondern der Einklang aller Ebenen innerhalb der Gesamtspirale (vgl. Wilber 2001a, S. 21, 189). Im Folgenden wird beispielhaft der Kontext einer Hierarchie von Wertehaltungen nach dem Spiral Dynamics-Modell skizziert, welches die jeweiligen Entwicklungsebenen bestimmten Farben[8] zuordnet:

- *Beige (SurvivalSense): archaisches Weltbild*: Beige beinhaltet eine archaisch-instinktive Weltwahrnehmung. Es zählen Grundbedürfnisse zum reinen Überleben. Nahrung, Wasser, Wärme, Sex und Sicherheit haben Priorität. Vorkommen: Frühe menschliche Gesellschaften, Neugeborene, hungernde Massen, etc. (vgl. Wilber 2001a, S. 21).
- *Violett/Purpur (KinSpirits): magisches Weltbild*: Violett wird durch das Verlangen nach Harmonie in einer geheimnisvollen Welt bestimmt. Animistisches Denken, der Glaube an magische Geister ist vorherrschend. Vorkommen: Blutschwüre, Sippenhaftung, Aberglaube etc. (vgl. Wilber 2001a, S. 21f.).
- *Rot (PowerGods): magisch-mythisches Weltbild*: Rot steht für den impulsiven Selbstausdruck und dem Bedürfnis nach Macht. Vorkommen: Wutanfälle von Zweijährigen, rebellierende Jugend, feudale Königreiche, epische Heroen, Warlords, Terroristen etc. (vgl. ebd., S. 22).
- *Blau (TruthForce): mythisches Weltbild:* Die Welt wird erstmals konventionell (z.B. in „richtig“ und „falsch“), gemessen an unveränderlichen Prinzipien interpretiert. Erstmals

---

[8] Die Verwendung von Farben empfiehlt sich im Rahmen dieser Arbeit aus rein pragmatischen Gründen, mag aber grundsätzlich sehr umstritten anmuten. Hierbei sei zu beachten, dass ein integrales Hierarchiemodell impliziert, dass jedes einzelne Individuum alle diese Ebenen „potentiell zur Verfügung hat“ (Wilber 2001a, S. 21). Die Betonung liegt daher nicht auf Typen *von* Menschen, sondern auf Typen *in* Menschen (vgl. ebd., S. 21, 136). Seit 2007 verwendet Wilber eine eigene, allgemein gefasste, Farbskala. Um Missverständnisse und Dopplungen zu vermeiden, wird im Rahmen dieser Arbeit ausschließlich die Farbskala des Spiral Dynamics-Modells verwendet, welches sich lediglich auf den Kontext von Wertehierarchien bezieht und welches die Grundlage früherer, nach wie vor relevanter, Veröffentlichungen liefert.

wird ein soziozentrisches Bewusstsein möglich. Vorkommen: Fundamentalismus, Ehrenkodex, Patriotismus etc. (vgl. ebd., S. 22).

- *Orange* (*StriveDrive*)*: Rationalität; Leistung*: Das Selbst entwickelt erstmals ein rationales und weltzentrisches Moralbewusstsein. Die Werte sind leistungsorientiert und materiell ausgerichtet. Orange bildet die Grundlage von Staaten, die auf gesellschaftlicher Vereinbarung beruhen. Vorkommen: Aufklärung, Homo Oeconomicus, Kolonialismus, Materialismus (vgl. ebd., S. 23).
- *Grün: sensitives Selbst (HumanBond):* Gefühle und Fürsorge treten an die Stelle von kalter Rationalität. Egalitarismus, Konstruktivismus und pluralistischer Relativismus sind vorherrschend. Vorkommen: Greenpeace, Postmodernismus, Tierschutz, politische Korrektheit, Menschenrechtsfragen (vgl. ebd., S. 23).
- *Gelb (FlexFlow):* Systemisches Denken ergänzt grüne Heterarchien durch „natürliche Hierarchien" (wie z.B. das hier gezeichnete Entwicklungsmodell). Wissen, Flexibilität und Kompetenz transzendieren Gruppensensitivität (vgl. ebd., S. 25).
- *Türkis (WholeView)*: Holistisches Denken vereinigt Fühlen und Wissen und macht eine komplexe Perspektive, wie z.B. den IA, möglich. Alle Ebenen spielen in der Gesamtspirale eine entscheidende Rolle (vgl. ebd., S. 25).
- *Transpersonale Bewusstseinsebenen:* Auf den transpersonalen Bewusstseinsebenen weitet sich das Ich-Bewusstsein auf alles Manifestierte aus. Es besteht keine mentale Dualität zwischen Subjekt und Objekt (vgl. Wilber 2002a, S. 345-380).[9]

Linien

Die Dimension der Entwicklungslinien verdeutlicht, dass Entwicklung in unterschiedlichen Bereichen geschehen kann. Das Selbst des Akteurs stellt, so gesehen, ein komplexes System dar, das sich aus der Gesamtheit all seiner in ihm integrierten Ebenen, innerhalb einer Vielzahl (etwa zwei Dutzend) paralleler Entwicklungslinien zusammensetzt. Hierunter zählen unter anderem Bereiche, wie die moralische, die kognitive, die interpersonale und die ästhetische Entwicklung. Einige Entwicklungslinien können sich unabhängig voneinander entwickeln (vgl. Wilber 2002b, S. 361-363). „Die Beziehung zwischen den verschiedenen Entwicklungslinien ist eine notwendige, aber nicht hinreichende (Wilber 2005, S. 351)." Generell lässt sich dieses Modell auch auf kollektive Akteure (z.B. Staaten) übertragen, allerdings mit anderen Ausprägungen (z.B. prägt sich der individuelle Kontext der „interpersonalen Entwicklung" im sozialen Kontext mit „Abwesenheit von Sklaverei aus) (vgl. Wilber 2003a: D: IV-4).

Typen

Auf jeder Ebene der Entwicklungslinien (Moral, Kognition etc.) sind auch noch unterschiedliche Entwicklungstypen zu unterscheiden. Je nach Kontext und Quadranten lassen sich unterschiedliche Typologien berücksichtigen, wie z.B. Persönlichkeitstypen (OL), kulturelle Zugehörigkeit (UL) (vgl. Wilber 2001a, S. 61), Verhaltenstypen (OR), Zugehörigkeit zu einer bestimmten sozialen Klasse etc. (UR).

---

[9] Im IA nimmt die spirituelle Dimension und ihre Vereinbarkeit mit der Wissenschaft eine besondere Stellung ein. Aus Komplexitätsgründen muss dieser wesentliche Aspekt des IA in dieser Arbeit allerdings ausgeklammert werden.

Zustände

Grundsätzlich ist es jedem Akteur auf jeder Bewusstseinsebene möglich, flüchtige Einblicke in alle Ebenen zu haben, die außerhalb seines derzeitigen langfristigen Ebenen-Schwerpunkts liegen. Es existieren unterschiedliche bewusste (Wachzustand) und unbewusste (Traum und Tiefschlaf) Zustandsformen, auf die im Rahmen dieses Papers nicht näher eingegangen werden kann. „Gipfelerfahrungen“ sind ein Beispiel für flüchtige Einblicke in transpersonale Zustände (vgl. Wilber 2002b, S. 98f.). „Eskalationen“ sind hingegen Zustände, bei denen Akteure kurzfristig auf niedere impulsivere Ebenen regredieren.

Konfliktdimensionen im Integralen Ansatz

Obwohl der IA keine Konflikttheorie darstellt, eignen sich die Schlüsseldimensionen des AQAL zu einer sehr allgemeinen Einordnung der Konfliktpotenziale des menschlichen Lebens. Jede dieser Dimensionen impliziert vielfältige Konfliktpotenziale, die sich in Form von „Absolutismen“ ausprägen können. Kennzeichnend für Absolutismen ist, dass der Inhalt einer Seite zu Gunsten einer anderen unterdrückt wird. Einige Beispiele wären:

- *Quadranten-Absolutismus*: Ein oder mehrere Quadranten dominiert über ein oder mehrere andere, z.B. Staat (Dominanz der kollektiven Quadranten: Totalitarismus) vs. Individuum (Dominanz der individuellen Quadranten: Anarchie)
- *Typen-Absolutismus*: Dominanz eines Typen, z.B. im Rahmen eines „Kampfes der Kulturen“[10]
- *Ebenen-Absolutismus*: Moderne (Orange) vs. religiöser Fundamentalismus (Blau).
- *Zustands-Absolutismus*: Nur die Wahrnehmung im Wachzustand wird als „real“ angesehen (Verdrängung z.B. von Traumrealitäten).
- *Linien-Absolutismus*: Paradoxon der Nazi-Ärzte (hohe kognitive bei niedriger moralischer Entwicklung) (vgl. Wilber 2003b: I).

Ein integrales Konfliktverständnis impliziert die philosophische Einsicht, dass die Wurzel aller Konflikte im weitesten Sinne darin liegt, dass aus Teilwahrheiten ein Absolutheitsanspruch erhoben wird und andere unterdrückt werden. Daher zielt eine integrale Konfliktbewältigung im Allgemeinen darauf ab, alle Teilwahrheiten ihrer Position im Gesamtkaleidoskop des AQAL zuzuordnen. Alle Teilwahrheiten sind damit nicht unbedingt gleich wahr, stellen aber als AQAL-Aspekte einen notwendigen Bestandteil des Ganzen dar (vgl. Wilber 2001a, S. 189f. am Beispiel der Integralen Politik).

---

[10] In der Friedens- und Konfliktforschung ist die von Samuel Huntington geprägte These eines „Kampfes der Kulturen“ wissenschaftlich umstritten. Allerdings muss eingeräumt werden, dass diese generalistische Wahrnehmung in fundamentalistischen Kreisen eine breite Akzeptanz findet, z.B. in der Debatte „Islam vs. christliches Abendland“. Auf Grund der Tatsache, dass diese Wahrnehmung von vielen Konfliktakteuren geteilt wird, arbeitet Wilber selber gerne mit dem Modell von Huntington im Rahmen der Typendimension (vgl. z.B. Wilber 2001a, S. 134).

Konzeptioneller Vorschlag zur epistemologischen und heuristischen Integration

Im Folgenden wird ein konzeptioneller Vorschlag zur epistemologischen und heuristischen Integration der Ansätze von Glasl und Galtung mit Hilfe des IA skizziert. An unterschiedlicher Stelle soll auch auf Möglichkeiten zur weiterführenden Forschung hingewiesen werden. Die hier angewandte Methode beruht weitgehend auf das, was Wilber als „Map Making“ bezeichnet: theoretische Inhalte (hier: von Glasl und Galtung) werden in gegebene metatheoretische Kategorien eingeordnet und im Rahmen dieser Kontexte diskutiert. Eine kritische Auseinandersetzung mit diesen Metakategorien erfolgt im abschließenden Teil dieser Untersuchung.

Epistemologische Einordnung und Integration

Im Folgenden werden die epistemologischen Bezugswelten der Ansätze von Glasl und Galtung in Bezug auf die fünf Untersuchungsdimensionen (Quadranten, Ebenen, Typen, Linien, Zustände) des IA integriert.

Konfliktmanagement nach Glasl

Ebenen: Glasls Kaskadenmodell beruht auf der vom IA geteilten Grundannahme, dass die Wahrnehmungen von Konfliktparteien in Eskalationen stufenweise regredieren. Für die weitere Forschung wäre es lohnenswert zu untersuchen, inwieweit ein reziproker Zusammenhang zwischen diesen „abwärtsgerichteten“ Regressionsstufen zu den „aufwärtsgerichteten“ Entwicklungsstufen entwicklungspsychologischer Modelle, wie z.B. den Spiral Dynamics, besteht. Hypothetisch plausibel erscheint z.B. die Annahme, dass eine hohe Entwicklungsstufe tendenziell eine gewaltfreie Konfliktaustragung (niedriges Eskalationsniveau) und eine niedrige (prä-)narzisstische eher einer gewalttätigen Konfliktaustragung (hohes Eskalationsniveau) begünstigt. Dies dürfte sich z.B. an den hohen Menschenrechtsstandards in den Demokratien der sog. „Ersten Welt“ bzw. dem Phänomen des sog. „OECD-Friedens“ zwischen diesen Staaten (Orange) widerspiegeln.

Linien: Eine Linienkonzeption findet sich nicht in Glasls Theorie, wohl aber Potenzial für weiterführende Forschungen auf der Basis seines Modells. Generell fragt sich, wie sich Eskalation in unterschiedlichen Entwicklungslinien ausprägt bzw. auch, ob es überhaupt unterschiedliche „Regressionslinien“ gibt. Darüber hinaus wäre auch interessant zu erforschen, inwieweit hinreichende oder notwendige Zusammenhänge sowie Korrelationen zwischen den Entwicklungsniveaus bestimmter Entwicklungslinien (z.B. interpersonell, kognitiv, moralisch) und der Tendenz zu einem bestimmten Eskalationsgrad der Konfliktaustragung bestehen.

Zustände: Glasl betont, dass sich (De-)Eskalationsprozesse dadurch auszeichnen, dass Stufen aufwärts und rückwärts übersprungen werden können. In Eskalationen nehmen die Konfliktwahrnehmungen vor allem die Form plötzlich emergierender Zustände an (vgl. Glasl 2004b). Die Zustandsdimension erklärt, weshalb durchschnittlich hoch entwickelte Akteure zu hohen Eskalationsstufen regredieren können.

Typen: Die Typendimension findet in Glasls Modell in Bezug auf die Unterscheidung „heißen“ und „kalten“ Austragungsformen des Konfliktes (OR) Berücksichtigung. Darüber hinaus gibt es aber noch viele verschiedene Typen oder Stile von Konfliktmanagement, z.B. die Bevorzug direkter Auseinandersetzung oder indirekter, mediierter Formen etc, aktive oder vermeidende etc.

Quadranten: Mit seinem Schwerpunkt auf das Eskalationsmodell finden vor allem strukturalistische (sprich: auf den Außenhorizonten bezogene) Betrachtungen besondere Berücksichtigung, weil die Intentionen der Konfliktparteien einer Ebenenstruktur zugeordnet werden. Die Struktur der Intention einer Konfliktpartei (Ich [OL] und Wir [UL] – Außen) hat ihre Entsprechung in einem spezifischen Verhalten (OR – Außen) und einem Beziehungsmuster (UR – Außen). Der Ansatz hat, auf Grund von Erfahrungen in der Bearbeitung von Konflikten im Organisationsbereich (vgl. Glasl 2004b), einen Fokus im Mesobereich. Das folgende AQAL-Modell fasst alles in Kürze wie folgt zusammen:

Tab. 4: Epistemologische Bezugspunkte von Glasls Methode im AQAL-Schema (vgl. Fathi 2008, S. 49)

Außen Ebenen: Eskalationsstufen Horizont: Außenbetrachtung von perzeptuellen Strukturen (s. Ebenen) Zustände: Eskalationen sind flüchtig und dynamisch	*Außen* Ebenen: Eskalationsstufen Typ: Austragungsform: heiß – kalt Horizont: Außenbetrachtung von Interaktion (s. Ebenen, s. Typ)
Intention	**Verhalten**
Weltbild	**Beziehung**
Außen Ebenen: Eskalationsstufen Typ: Konfliktatmosphäre (heiß – kalt) Horizont: Außenbetrachtung von normativen Strukturen (s. Typ) und von kollektiven Perzeptionen (s. Ebenen)	*Außen* Ebenen: Eskalationsstufen Typ: Austragungsform: heiß – kalt Horizont: Außenbetrachtung von Beziehungsmustern (s. Ebenen, s. Typ)
Fokus: Mesobereich	Fokus: Mesobereich

Transcend nach Galtung

Quadranten: Durch die Ausdifferenzierung von drei Gewaltbereichen und ihrer Tiefendimensionen werden fast alle acht Horizonte des IA abgedeckt. Die Dimension der kulturellen Gewalt lässt sich dem Außenbereich des „Wir“ (UL) zuordnen. Sie untersucht Symbole, kollektive Motivationsstrukturen etc., die direkte Gewalt legitimieren. Die Tiefendimension kultureller Gewalt erschließt sich durch die hermeneutische Untersuchung kollektiver Mythen und Traumata und lässt sich daher dem Innenbereich des UL-Quadranten zuordnen.

Die strukturelle Gewalt wird vom Außenhorizont des UR-Quadranten erfasst. Hierbei wird den sozialen, ökonomischen und anderen Konfliktfaktoren Rechnung getragen. Die Tiefendimension der strukturellen Gewalt ordnet sich dem Innenbereich desselben Quadranten (UR) zu, weil die acht strukturellen Konfliktlinien und das PSFM-Syndrom einen wesentlichen Einfluss auf die Selbsterhaltung des Konfliktsystems haben.

Die direkte Akteursgewalt spiegelt sich im verhaltensspezifischen Außenbereich des OR-Quadranten wider. Die Tiefendimension der Akteursgewalt trägt den Grundbedürfnissen der Konfliktakteure Rechnung welche sich hingegen aus einer tiefenpsychologischen Interpretation der Akteursmotivation im Innenbereich des OL-Quadranten erschließen.

In Bezug auf die Konfliktbereiche bezieht sich Transcend zumeist auf Inter- und Intra-Meso- und -Makro-Konflikte, nicht jedoch auf (Intra-)Mikro-Konflikte.

Ebenen: Eine vertikale Ebenendimension wird in Transcend nur indirekt berücksichtigt, zumal die Konflikttransformation eine Überwindung des Konflikts und der Perzeptionen aller beteiligten Akteure impliziert. Galtung räumt hierbei selber ein, dass Studien „im Stil von Piaget, die die kognitive Komplexität von Konfliktergebnissen dem Alter, Geschlecht und anderen Faktoren zuordnen" für Transcend gebraucht würden (vgl. Galtung/Tschudi 2003, S. 201).

Hierbei wäre von weiterführendem Interesse, Galtungs Theorie der drei bis sechs Gewaltbereiche um vertikale entwicklungspsychologische Einsichten zu erweitern.

Typen: Galtungs Bezug auf die Typendimension wurde hier nicht genau schematisiert, jedoch wird sie in der Konfliktbearbeitung insofern berücksichtigt, als darauf hingearbeitet wird, die spezifischen Friedensanteile lokaler Konfliktkulturen und die Episteme unterschiedlicher Kulturkreise gezielt zu nutzen (vgl. Galtung 2008, S. 52-67).

Linien: Die Liniendimension ist in der Transcend-Theorie nicht genau modelliert, wird aber in der Praxis indirekt mitberücksichtigt. So besteht Galtung in seinen Vorschlägen stets auf Initiativen der Zusammenarbeit der Konfliktakteure in möglichst unterschiedlichen Bereichen, z.B. Kultur, Ökologie (vgl. z.B. Galtung 2003, S. 272f. zum Koreakonflikt).

Innen: Grundbedürfnisse **Intention**	*Außen*: direkte Gewalt **Verhalten**
Kultur *Außen*: kulturelle Gewalt Innen: Tiefenkultur Fokus: Makro- und Mesobereich	**Struktur** *Außen*: strukturelle Gewalt Innen: Tiefenstruktur Fokus: Makro- und Mesobereich

Grafik 5: Epistemologische Bezugspunkte von Transcend im Quadranten-Schema (Fathi 2008, S. 52)

Epistemologische Überschneidungen und Ergänzungen beider Methoden

Zwischen den epistemologischen Bezugswelten der beiden Ansätze ergeben sich Überschneidungen und auch Ergänzungen. Die wichtigsten lassen sich in einer AQAL-Gesamtschau wie folgt skizzieren (vgl. hierzu Grafik 5):

Quadranten: Mit der Unterscheidung von drei Gewaltarten und ihrer Tiefendimensionen nimmt allein Transcend Bezug auf sechs Horizonte (vgl. Grafiken 4 und 5). Die Regressionsstufen von Glasls Modell ergänzen diese Gesamtschau um strukturalistische Perspektiven im Außenhorizont der linksseitigen Quadranten. Eine weitere Ergänzung besteht durch die Zusammenführung von Meso- (Glasl) und Makro (Galtung) in den Kollektiv-Quadranten. Die kollektiven Quadranten des AQAL lassen sich in diesem Sinne gut in Unterkategorien, wie „Mikro“, „Meso“, „Makro“, unterteilen.

Ebenen: Bei einem Vergleich beider Ansätze wäre von weiterführendem Forschungsinteresse, ob und inwieweit die Eskalationsstufen von Glasl in Verbindung mit den drei Gewaltarten von Galtung gesehen werden können. Auch aus einer entwicklungsorientierten Ebenenperspektive wäre es wohl hypothetisch sinnvoll anzunehmen, dass sich die horizontalen Gewaltdimensionen von Transcend – direkte (OR), kulturelle (UL) und strukturelle Gewalt (UR) – auf vertikale Ebenenniveaus ausdifferenzieren lassen. Beispielsweise scheint eine rohe präkonventionell-anarchische Gewaltausprägung, wie z.B. in den sog. „Neuen Kriegen“ (Rot), eine andere Qualität aufzuweisen als in den tendenziell geregelteren interstaatlichen Kriegen, wie z.B. dem deutsch-französischen Krieg (Blau) oder dem vergleichsweise „rational“ geführten Kalten Krieg zwischen Ost- und Westblock (Orange).

Hierzu dürfte auch von weiterem Untersuchungsinteresse sein, ob und inwieweit eine Korrelation zwischen den Ebenen eines aufwärtsgerichteten Entwicklungsschemas à la Spiral Dynamics und jenen eines abwärtsgerichteten Eskalationsmodells à la Glasl besteht.[11] Allerdings wird eine direkte wechselseitige Zuordnung der Ebenen beider Modelle dadurch erschwert, dass jede Entwicklungsebene auch auf ihrer Höhe direkte Gewalt legitimieren kann. D.h. in Gewaltkonflikten könnte ein nach den Spiral Dynamics hoch entwickelter Akteur (OL) aus behavioristischer Sicht (OR) dennoch auf einer hohen Eskalationsstufe handeln, die man normalerweise Akteuren mit einer niedrigen Entwicklung zugeordnet hätte. Hierzu wäre es lohnenswert zu erörtern, welche Friedens-, Konflikt- und Gewaltwahrnehmung die einzelnen Entwicklungsebenen implizieren (näher hierzu Fathi 2008).

Um kollektive Akteure wie Staaten in einem für die Konfliktforschung angemessenen Ebenenkontext untersuchen zu können, müssten neben entwicklungsstrukturalistischen Methoden zur Erforschung der inneren Entwicklung (Wertstrukturen, Motive) auch andere (rechtsseitige) Erhebungsindikatoren hinzugezogen werden, auf die jedoch im Rahmen dieses Papers nicht näher eingegangen werden kann (näher hierzu Fathi 2008). So sei lediglich darauf hingewiesen, dass Modelle, wie die Spiral Dynamics, z.B. nicht erklären könnten, warum die hochentwickelten USA [Orange] seit 1945 einen unerreicht hohen Index-Wert von etwa 67 globalen Interventionen (davon 56 direkte Gewaltanwendungen) aufweisen (vgl. Galtung 2003, S. 130f.).

---

[11] An dieser Stelle lohnt es sich auch zu überlegen, inwieweit die “fünf Arten des Konfliktumgangs” (Grafik 3) den Ebenen des Eskalations- (Glasl) oder des Entwicklungsspektrums zugeordnet werden können (näher hierzu Fathi 2008).

Aufschluss für einen schlüssigeren theoretischen Zusammenhang zwischen Eskalation (Glasl) und Entwicklung (Wilber) dürfte auch die zusätzliche Berücksichtigung der Zustands- und Liniendimension des IA geben.

Zustände: Regressionen sind i.S. von Eskalationen als vorübergehende Zustände zu verstehen, die auch Ebenen überspringen können. Das Kaskadenschema von Glasl bezieht sich daher auf vergleichsweise kurzfristige Bewusstseinszustände, entwicklungspsychologische Ebenenmodelle hingegen auf langfristige Entwicklungen. Die Zustandsdimension verdeutlicht, dass jeder Akteur jeder Entwicklungsstufe in einem Konflikt zugleich einen hohen Eskalationsgrad aufweisen kann. Damit wird eine einseitige Zuordnung tendenziell niedrig entwickelter Akteure („Terroristen“, „Warlords“) mit hohen Eskalationsstufen vermieden.

Linien: Ein theoretischer Zusammenhang zwischen Entwicklungsniveaus und Tendenzen zur Eskalation dürfte plausibel sein, wenn Entwicklung in mehreren Kontexten kartografiert wird. Wie oben erörtert, besteht aber noch Forschungsbedarf zu erörtern, die Tendenz eines Akteurs zu einer bestimmten Konfliktaustragung einer Eskalationsstufe zuzuordnen – bei individuellen Akteuren z.B. in Bezug auf die kognitive, interpersonelle, moralische Entwicklung, bei kollektiven Akteuren in Bezug auf den Zusammenhang zwischen der Entwicklung von Wirtschaft, Menschenrechtsstandards, Demokratie, technologischer Stand etc.

Typen: Ein wesentlicher Beitrag des Ansatzes von Glasl ist die Unterscheidung von Konfliktaustragungstypen. Für die weitergehende Forschung wäre es lohnenswert, dieses Schema mit anderen Typologien in Beziehung zu setzen, z.B. Kulturen (OL), Persönlichkeitstypen (z.B. Myers-Briggs [OL]) etc.

Zusammenfassend lassen sich die Ergebnisse der epistemologischen Integration der vorgestellten Ansätze im AQAL wie folgt grafisch schematisieren:

Außen: Glasl – Eskalationsstufen: Perzeption als Außenform der Intentionalen Gewalt (?) – Anreiz für die weitere Forschung: Zusammenhang von Eskalation (Regression) mit Entwicklungsebenen, -linien, -typologien und Bewusstseinszuständen ***Innen:*** **Transcend** Grundbedürfnisse **Intention**	*Außen:* Transcend – Direkte Gewalt; weitere Forschung: Zuordnung zu Entwicklungsebenen der Gewalt – Glasl: – Eskalationsstufen: Interaktion; – Typologien der Konfliktaustragung (heiß – kalt); – Anreiz für die weitere Forschung: Zusammenhang mit Typologien aus anderen Quadranten (Kultur, System, Persönlichkeitstypen etc.) ***Innen:*** Nicht berücksichtigt. **Verhalten**
Kultur *Außen:* Transcend: kulturelle Gewalt; Anreiz für die weitere Forschung: Zuordnung zu Entwicklungsebenen der Gewalt Glasl – Konfliktatmosphäre – Anreiz für die weitere Forschung: Zusammenhang von Eskalation (Regression) mit Entwicklung und Linien; Eskalationsstufen: Weltbild ***Innen:*** **Transcend:** Tiefenkultur Meso (Glasl); Makro (Transcend)	**Struktur** *Außen:* Transcend: – strukturelle Gewalt; – verschiedene Indikatoren des kollektiven Konfliktverhaltens – Anreiz für die weitere Forschung: Zuordnung zu Entwicklungsebenen der Gewalt – Glasl: – Eskalationsstufen: Beziehungsmuster; – Anreiz für die weitere Forschung: Zusammenhang von Eskalation (Regression) mit Entwicklung und ***Innen:*** Tiefenstruktur Meso (Glasl); Makro (Transcend)

Grafik 6: Epistemologische Integration aller Ansätze im AQAL (Eigenanfertigung)

Ein Vorschlag zur heuristischen Integration der vorgestellten Methoden

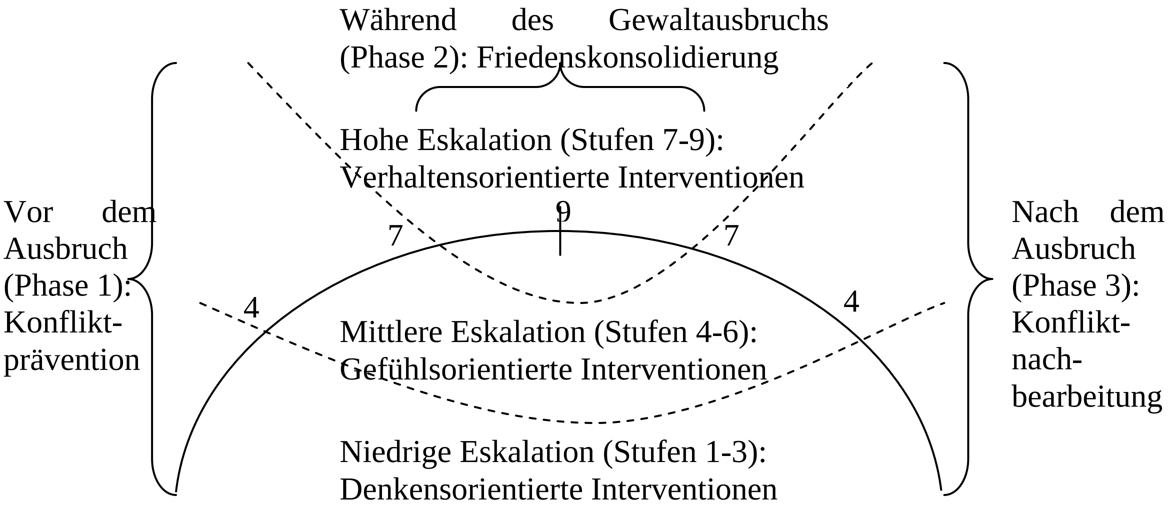
Bei der Skizzierung eines heuristischen Metamodells geht es darum, ein allgemein anwendbares Grundgerüst zu skizzieren, das Lagebeurteilungen, Entscheidungsfindungen und Problemlösungen in komplexen Konfliktsituationen ermöglicht. Hierbei erweisen sich die eher epistemologisch ausgerichteten Metakategorien des AQAL-Rasters als nicht ausreichend und nennenswerte Verbesserungsvorschläge zu seiner Erweiterung haben sich bislang noch nicht finden lassen.[12] Umgekehrt liefern die holistischen Modelle von Glasl und Galtung selbst einander bestätigende und ergänzende Metakategorien, die an die heuristischen Erfordernisse der Friedens- und Konfliktforschung besser angepasst sind und das AQAL entsprechend erweitern könnten. Hierbei treffe ich die grobe Unterscheidung von Metakategorien mit einem „vertikalen" Design (hier z.B. die vertikale Struktur eines Eskalations- oder Entwicklungsebenenmodells) und den eher heterarchisch bzw. „horizontal" schematisierten Metakategorien (hier z.B. die quasi synchrone Struktur von vier Quadranten bzw. die drei Gewalten, paralleler Entwicklungslinien oder Kulturen/Typen).

Integration unterschiedlicher Interventionsmethoden in ein vertikales Schema

Sowohl Glasls Eskalationsschema als auch Galtungs Modell vom „Lebenszyklus eines Konfliktes" stellen vertikale Raster dar, die es ermöglichen, vielfältige Interventionsmittel unterschiedlichen Ansatzpunkten eines Konflikts zuzuordnen. Beide Ansätze unterscheiden hierbei grundsätzlich zwischen gewalttätig und nicht-gewalttätig ausgetragenen Konflikten. Hierbei ermöglicht Galtungs Unterscheidung der drei Phasen „Vor", „Während" und „Nach der Gewalt" eine umfassende Einordnung von Interventionsmethoden nach den Kategorien „Konfliktprävention", „Friedenssicherung" und „Nach-Konfliktbearbeitung". In Ergänzung dazu, lassen sich die drei Phasen durch das Eskalationsstufenmodell von Glasl noch weiter unterteilen. Dieser Ansatz ermöglicht es ein ganzes Spektrum an perzeptions-, gefühls- und verhaltensorientierten Interventionsansätzen zu integrieren und der Konfliktdynamik anzupassen (vgl. Grafik 2). Beide Modelle in einem Schema zusammengefasst, ergeben einen Konfliktbogen. Idealtypisch lassen sich die Eskalationsstufen im Bereich zwischen „Während" und „Nach der Gewalt" in umgekehrter Reihenfolge anordnen. Da es sich bei (De-)Eskalationen um Zustände handelt, sei hierbei angemerkt, dass diese nicht zwangsläufig Schritt für Schritt erfolgen müssen, sondern durchaus Stufen übersprungen werden können (vgl. Glasl 2004b). Das bisherige Schema lässt sich wie folgt grafisch darstellen:

---

[12] Mark Edwards' Ansatz stellt hierbei einen der wenigen Vorstöße dar, das AQAL an die Erfordernisse der mediativen Konfliktbearbeitung anzupassen. Hierbei schlägt er vor, das Vier-Quadrantenschema nach den sechs grammatikalischen Hauptperspektiven, zu einem „Sextant"-Modell, weiter auszudifferenzieren und damit eine (das Vier-Quadrantenmodell nicht ersetzende, sondern vielmehr) ergänzende Metaperspektive aufzuzeigen. Während das Vier-Quadrantenmodell nur die 1. und 3. Person Plural und Singular berücksichtige, würde sein Framework, mit der zusätzlichen Berücksichtigung der 2. Person, auch die Perspektiven „Du" und „Ihr" abdecken. Gleichzeitig würden alle sechs Personen ihrerseits ein eigenes Vier-Quadrantenmodell aufweisen [dies leuchtet vor allem in Bezug auf die beiden oberen Quadranten ein, die ja bei jedem Individuum einzigartig sind] (vgl. Edwards 2005). Zwar dürfte m.E. ein wesentlicher Vorteil dieser Unterscheidung von „Ich"-, „Du"-, „Er/Sie/Es"-, „Wir"-, „Ihr"- und „Sie"-Perspektiven (inklusive der unterschiedlichen einander überlappenden AQAL-Dimensionen in allen Perspektiven) darin bestehen, die für den Konfliktdialog sehr wichtigen Aspekte der (un-)bewussten Selbst- und Fremdwahrnehmung zu integrieren. Allerdings ist dieser wichtige Beitrag von Edwards' im Rahmen des hier zu untersuchenden und sehr eng gefassten heuristischen Metakontexts nur von geringfügiger Bedeutung und hat noch wenig praxisbezogene Relevanz. Edwards' Ansatz dürfte in dieser Form eher einen viel versprechenden Vorstoß darstellen, das AQAL-Modell im epistemologischen Metakontext auszubauen.



Während des Gewaltausbruchs (Phase 2): Friedenskonsolidierung
Hohe Eskalation (Stufen 7-9): Verhaltensorientierte Interventionen

Mittlere Eskalation (Stufen 4-6): Gefühlsorientierte Interventionen
Nach dem Ausbruch (Phase 3): Konflikt-nach-bearbeitung
Niedrige Eskalation (Stufen 1-3): Denkensorientierte Interventionen

Grafik 7: Integration von Interventionsmethoden in ein vertikales Schema (Fathi 2008, S. 61)

Horizontale Integration unterschiedlicher Interventionsmethoden

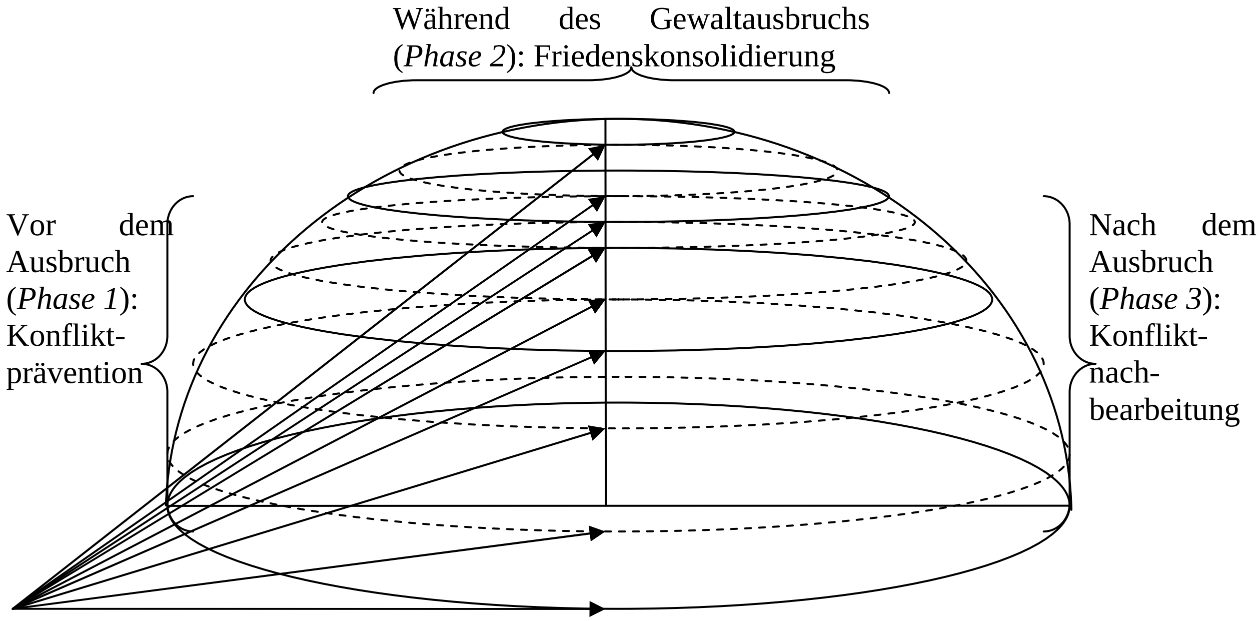
Auf jeder Eskalationsebene dieses in Grafik 6 dargestellten Konfliktbogens lassen sich die Interventionen nach horizontalen Typologien weiter ausdifferenzieren, die von den Modellen von Glasl und Galtung formuliert wurden.

Hierbei unterscheidet Glasl auf jeder der ersten sechs Eskalationsebenen zwischen kalten und heißen Konflikten und dazugehörige Interventionsstrategien (eskalierend, de-eskalierend), wie bereits in Tabelle 2 skizziert. In Verbindung mit Tabelle 3 lässt sich zusätzlich das Konzept der Galtung'schen Konfliktphasen berücksichtigen: Die präventiven Methoden tragen der Konfliktphase „Vor dem Gewaltausbruch“ Rechnung und die kurativen Interventionen beziehen sich auf die Phase „Nach dem Gewaltausbruch“.

Wie in Tabelle 1 dargestellt, lässt sich mit dem gesamten vertikalen Interventionsspektrum (denkens-, gefühls- und verhaltensorientiert) eine weitere horizontale Dimension in Beziehung setzen: Kriterien der Konfliktanalyse. Glasl unterscheidet hierbei fünf Kriterien, wobei aber anzumerken ist, dass diese je nach Kerninteresse der Konfliktanalyse sehr stark variieren können und darum nur sehr bedingt generalisierbar sind. Um sicher zu gehen, dass alle relevanten Schlüsseldimensionen des Konfliktes abgedeckt werden, wäre es hierbei generell lohnenswert, Quadranten-/Horizonten auf jeder Ebene mitzuberücksichtigen ergänzend hinzuzuziehen. Auch wenn ein Konflikt stets Entsprechungen in allen Quadranten hat, ist in Anlehnung an das Interventionsspektrum von Glasl (vgl. Grafik 3), davon auszugehen, dass sich der kurzfristige Schwerpunkt einer integrierten Intervention hin zu den rechtsseitigen Quadranten, insbesondere dem Bereich der direkten Gewalt (OR) verschiebt, je höher der Eskalationsgrad wird.

Eine kombinierte Berücksichtigung horizontaler (hier z.B. Quadranten, Typen, Linien) und vertikaler Dimensionen (hier z.B. Eskalationsebenen) ist für eine Metatheorie der Konfliktbearbeitung sinnvoll. Mit der Integration wesentlicher Aspekte der Ansätze von Wilber, Glasl und Galtung, könnte das sich hieraus ergebende Metamodell einen Beitrag leisten, der Komplexität von Konfliktsituationen gerecht zu werden; sowohl hinsichtlich ihrer Einschätzung als auch bei der Wahl der mediativ-dialogischen Mittel zu ihrer Bewältigung. Der Beitrag dieses Gerüsts kann jedoch, auf Grund seiner geringen Repräsentativität (die aus Komplexitätsgründen in dieser Arbeit auch nicht gewährleistet werden kann), nur einen beispielhaften Charakter haben. Daher wären in Bezug auf die Ausgestaltung der Metakategorien des vorliegenden Modells vielfältige Erweiterungsmöglichkeiten denkbar.

Schematisch wird hier eine Kartografie vorgezogen, die das *vertikale* eskalationsorientierte Spektrum als Ausgangsmodell nimmt – sprich: die Grafik 6 – und die anderen *horizontalen* Dimensionen des epistemologischen Modells (Quadranten, Typen, Linien) hineinintegriert. Hieraus ergibt sich ein idealtypisches dreidimensionales Schema, das sich wie folgt darstellt:



Während des Gewaltausbruchs (*Phase 2*): Friedenskonsolidierung
Vor dem Ausbruch (*Phase 1*): Konfliktprävention
Nach dem Ausbruch (*Phase 3*): Konfliktnachbearbeitung

Horizontale Ausdifferenzierung weiterer Interventionsaspekte auf jeder Ebene, Beispiele:

Vertikale Horizontale	*Phase 1* (niedrige bis mittlere Eskalation): Konfliktprävention	*Phase 2* (hohe Eskalation): Friedenskonsolidierung	*Phase 3* (niedrige bis mittlere Eskalation): Konfliktnachbearbeitung
Quadranten: Gewaltbereiche nach Transcend + intentionale Gewalt (nach GFK)	konstruktive Konfliktkulturen (UL), -strukturen (UR), Intentionen (OL) und Verhalten (OR) fördern	Waffenembargos und Friedenstruppen (UR); Evakuierung von Zielen (OR); Demoralisierung von Soldaten (UL); Negativprognosen an alle Parteien (OL)	konstruktive Konfliktkulturen (UL), -strukturen (UR), Intentionen (OL) und Verhalten (OR) wieder herstellen; Versöhnung
Typen: Austragungsformen nach Glasl; vgl. Tab. 3)	Präventiv: De-eskalierend (heiß); eskalierend (kalt)	-	Kurativ: De-eskalierend (heiß); eskalierend (kalt)
Kriterien der *Konfliktanalyse* nach Glasl (Bezug zum vertikalen Interventionsspektrum vgl. Tab. 1)	z.B. Issues; Konfliktverlauf; Parteien intern; Parteien extern (Beziehungen); Grundeinstellungen	-	z.B. Issues; Konfliktverlauf; Parteien intern; Parteien extern (Beziehungen); Grundeinstellungen

Grafik 8: Integration horizontaler und vertikaler Interventionsaspekte (Fathi 2008, S. 63)

Herausforderungen für die Metatheoriebildung

Die Anwendung von Metatheorien birgt vielfältige Herausforderungen, die es im Allgemeinen zu berücksichtigen gilt. Hierunter sind einige Punkte von besonderer Relevanz für die Friedens- und Konfliktforschung. Diese lassen insbesondere sich im Rahmen einer Gegenüberstellung aller drei Ansätze näher erläutern.

Allgemeine Herausforderungen für die Metatheoriebildung

Im Wesentlichen sieht das metatheoretische Map Making vor, verallgemeinerbare Metakategorien zu definieren und darin die inhaltliche Komplexität unterschiedlicher Perspektiven zu integrieren. Hieraus erwachsen allgemeine Herausforderungen, von denen sich einige wesentliche gut am Beispiel des IA und seinem Konzept der Orientierungsverallgemeinerungen darstellen lassen.

Eine wesentliche Herausforderung dürfte darin bestehen, die Gefahr der „Immunisierung“ und der „Ideologisierung“ zu vermeiden. Im Falle des IA ließe sich z.B. kritisch fragen, ob Wilbers Konzept der Orientierungsverallgemeinerungen, philosophische Annahmen, die nicht denseinigen entsprechen, ausgeschlossen würden? Von anderer Seite wäre auch die Versuchung zu vermeiden, legitime kritische Standpunkte, z.B. über das Ebenenmodell, einfach wegzuerklären. Hierauf wird im nächsten Kapitel noch näher einzugehen sein. Die Gefahr der Immunisierung muss gegenüber eingeräumt werden, dass sie auch anderen Theorien und Disziplinen – sowohl im metatheoretischen als auch im theoretischen Kontext – immanent ist. Als Beispiele wären hier unter anderem die Tiefenpsychologie oder der Marxismus zu erwähnen. Dieses Problem dürfte im Idealfall lösbar sein, wenn die drei oben skizzierten Stränge zum Erwerb echten Wissens gewährleistet sind.

Eine weitere wesentliche Herausforderung besteht vor allem auch in Bezug auf die Auseinandersetzung mit unterschiedlichen Interpretationen derselben Metakategorien. In einem relativ aktuellen Beispiel weist Mark Edwards in Bezug auf Wilbers „drei Stränge zum echten Wissenserwerb“ darauf hin, dass ein Schritt der Dateninterpretation fehlen würde. Im Quadrantenmodell wäre dies nach Edwards im Prinzip auch vorgesehen – so ordnet er die Injunktion dem Quadranten OR zu, die Datenintuition dem OL-Quadranten, die Dateninterpretation UL und die Verifikation/Falsifikation dem Quadranten UR. Alle vier Schritte zusammengenommen, würden einem integralen, sich stets wiederholenden „Zyklus’“ des Wissenserwerbs entsprechen (vgl. Edwards 2000). Wilber wendet gegenüber Edwards’ Verbesserungsvorschlag ein, dass eine exakte Passgenauigkeit dieser Schritte mit dem Quadrantenmodell nicht gegeben sei. Er führt an, dass sich alle drei Schritte grundsätzlich in allen vier Quadranten ausprägen können und sich daher nicht beschränken ließen. Dies gelte z.B. für kontemplative Injunktionen und Datengewinnungen, die sich nicht im OR-, sondern ausschließlich im OL-Quadranten ausprägen. Edwards würde aber den Schritt der Injunktion ausschließlich im OR-Quadranten verorten. Zudem sei nach Wilber die interpretative Komponente des UL-Quadranten stets in allen drei Strängen vertreten und ein zyklischer Vorgang sei ohnehin gegeben (vgl. Wilber 2000). In dieser kleinen Debatte deutet sich beispielhaft an, dass beide hier vertretenen Positionen in ihrem jeweiligen Kontext durchaus Recht haben, da sie, jede für sich, eine in sich logische, aber dennoch voneinander abweichende

Interpretation der drei Stränge sowie des Quadrantenmodells aufweisen. Während Wilber alle vier Quadranten in einem strikt synchronen Verhältnis zueinander verstanden wissen möchte (und diese *nicht* mit den sequenziell aufeinander folgenden drei Strängen gleichsetzt, sondern eher alle Quadranten in jedem Strang präsent sieht), tendiert Edwards zu einer Interpretation, die die Quadranten in ein sequenzielles Verhältnis stellt (und diese auf die Ebene der drei Stränge überträgt, woraus sich dann vier Stränge ergeben). Über diese unterschiedlichen Grundannahmen haben sich aber beide Vertreter vorher nicht verständigt. Dabei ließen sich die Beiträge beider Modelle durchaus miteinander zu kombinieren, vorausgesetzt, man fasst beide Positionen nicht in einem Entweder-oder-, sondern in einem Sowohl-als-auch-Verhältnis auf: Edwards Beitrag sieht vor, drei Stränge um einen Schritt zu ergänzen und damit zu einem Vier-Stränge-Modell auszubauen und, auf Grund der sich hieraus ergebenden konzeptionellen Einfachheit, mit dem Vier-Quadranten-Modell gleichzusetzen. Wilbers Beitrag besteht zum anderen darin, alle Stränge/Schritte multidimensional aufzufassen und daher in jedem einzelnen dieser Schritte das Vier-Quadranten-Modell synchron zu berücksichtigen. Das Ergebnis würde also ein ineinander verschachteltes Quadrantenmodell vorsehen, welches, einerseits auf der Oberfläche eine sequenzielle Abfolge der Quadranten impliziert (hier: im Kontext der aufeinander folgenden Stränge), andererseits, innerhalb jedes Quadranten, ein synchrones Verhältnis aller Quadranten berücksichtigt. Der Ansatz eines ineinander verschachtelten Quadrantenmodells ist bereits in Wilbers Acht-Horizonten-Modell bzw. in Edwards Sextanten-Modell angelegt. Am Beispiel dieser Debatte zeigt sich einerseits die Lösbarkeit von Metadiskursen (vorausgesetzt natürlich, die Positionen beziehen sich auf dasselbe Thema), andererseits aber auch der hierzu erforderliche Aufwand sich mit den scheinbar gegensätzlichen Positionen angemessen auseinanderzusetzen.

Eine weitere wesentliche Herausforderung dürfte darin bestehen, die unterschiedlichen Auflösungsgrade, in denen metatheoretische Modelle zur Anwendung kommen können, stärker zu systematisieren. So ließe sich viel Konfliktpotenzial, vor allem von Seiten von VertreterInnen, die ihre Disziplin nicht gern in eine Kategorie „gepresst“ wissen möchten, abschwächen. Hierzu ein Beispiel: Oberflächlich gesehen ließe sich die *„neurolinguistische Programmierung“* (NLP) einfach dem Quadranten OR zuordnen (wie z.B. in einem Schema des integralen Psychotherapeuten Weinreich unter ders. 2005, S. 157). Aus einer tiefer gehenden Perspektive wäre diese Zuordnung aber ungenau, zumal der Komplex der NLP Subdisziplinen, wie z.B. die Selbsthypnose (OL), die kommunikative und gestalttherapeutische (UL) und sogar systemwissenschaftliche Aspekte (UR) enthält (näher hierzu vgl. z.B. Seymour / O’Connor 2009), welche sich eher den anderen Quadranten zuordnen. So gesehen, würde eine Disziplin, die sich aus einer oberflächlichen Perspektive nur einem Quadranten zuordnet, aus einem tiefer gehenden Blickwinkel alle vier Quadranten abdecken. Dies angemessen zu berücksichtigen, dürfte für die weiterführende Forschung noch eine enorme Herausforderung darstellen.

Dennoch dürfte sich die Metatheoriebildung auf allen Ebenen (theoretisch und metatheoretisch) Konfliktpotenzial in mannigfaltiger Form ausgesetzt sehen. Da Metakategorien klar auf der metatheoretischen Ebene anzusiedeln sind, indem sie, über verschiedene Gebiete hinweg, Muster ordnen, die nur auf dieser Ebene sichtbar werden, können und müssen sie nicht einen Grundkonsens zwischen ForscherInnen innerhalb spezifischer Felder widerspiegeln (wie von Wilber behauptet). Vielmehr ist anzunehmen, dass es in den seltensten Fällen Konsens innerhalb spezifischer Forschungsfelder gibt und noch weniger Konsens über verschiedene Forschungsfelder hinweg. Hinzu kommt noch, dass wissenschaftliche Aussagen an bestimmte

Paradigmen und Vorannahmen gebunden sind, die untereinander auch nicht zwangsläufig in einem Konsens sind. Auf diesen Punkt wird näher im nächsten Kapitel am Beispiel der drei Ansätze einzugehen sein.

Spezifische Herausforderungen für die Metatheoriebildung in der Friedens- und Konfliktforschung

Im Folgenden möchte ich auf einige wesentliche Herausforderungen für die Metatheoriebildung in der Friedens- und Konfliktforschung eingehen, die sich vor allem aus der vorliegenden Untersuchung ergeben haben. Hierzu ist es notwendig, die zum Teil unterschiedlichen Ansprüche der Metatheoriebildung im epistemologischen sowie im heuristischen Kontext zu berücksichtigen.

Epistemologischer Kontext

Aus dem oben skizzierten Grundgerüst deutet sich insgesamt ein relevanter Mehrwert für die Friedens- und Konfliktforschung an, die epistemologischen Bezugspunkte unterschiedlicher Ansätze – hier: am Beispiel der beiden (im Übrigen sehr metatheoretisch ausgeprägten) Ansätze von Galtung und Glasl – zu integrieren.

Kritisch ist jedoch anzumerken, dass das AQAL nur ein begrenztes Modell darstellt, die hier vorgestellten Methoden in einen, von vielleicht anderen denkbaren Metakontexten einzuordnen. Diesem Integrationskontext müssen und können die ProtagonistInnen der integrierten Methoden nicht immer zustimmen.

1. Dies dürfte zum einen daran liegen, dass die in diesem Schema integrierten Methoden – auf Grund der Begrenztheit des AQAL-Modells – niemals in ihrer ganzen Fülle wiedergegeben werden können. Die Grenzen der Untersuchung zeigen sich z.B. darin, dass das AQAL-Modell nicht geeignet ist, eventuell gewichtige Widersprüche, die zwischen allen drei vorgestellten Modellen auf der theoretischen Ebene bestehen, zu erfassen und metatheoretisch zu integrieren. Im Rahmen dieser Untersuchung wurden diese Widersprüche bewusst ausgeklammert, allerdings dürfte ihre Berücksichtigung im weiterführenden Diskurs von Interesse sein. Dies gilt z.B. für die anthroposophischen Implikationen in Glasls Modell (vgl. Glasl 2004a), welche nicht immer gänzlich vereinbar mit Wilbers Modell der menschlichen Psyche sein dürften oder von Galtungs Seite, seine von Wilbers Theorie abweichende Deutung des Begriffs der „Spiritualität" (Galtung setzt dies mit dem Begriff der „immanenten Religion" gleich [vgl. Galtung 1998, 2008], was im Kontext des IA eine fast entgegen gesetzte Bedeutung erhält). Ohne näher auf diese sehr komplexen Diskurse einzugehen, sei festzuhalten, dass zwischen allen drei Ansätzen durchaus gewichtige Widersprüche bestehen (wenn man nach ihnen sucht). Diese lassen sich insofern „lösen", indem man bestimmt, welcher Ansatz die anderen aus seiner spezifischen Metaperspektive integriert. In diesem Fall wurden die Ansätze von Glasl und Galtung in die Metakontexte des IA „eingepasst" und aus dieser Perspektive interpretiert. Das Kapitel über die „heuristische Integration" zeigt hingegen einen anderen Kontext, in dem sich alle drei Ansätze auf gleicher metatheoretischer „Augenhöhe" begegnen. Doch selbst diese Integration stellt nur eine Verknüpfung von

„Ausschnitten“ aller drei Ansätze dar, da die oben angedeuteten (epistemologischen) Widersprüche weiterhin ausgeklammert bleiben.

2. Zum anderen lässt sich auch stets über die Gültigkeit und den Nutzen der dem AQAL-Modell zu Grunde liegenden Annahmen über sog. „Orientierungsverallgemeinerungen“ streiten: so fällt z.B. in der Friedens- und Konfliktforschung auf, dass Metakontexte, wie z.B. die Wilber-typische Verwendung von Ebenenmodellen, tendenziell gemieden werden, da Hierarchien zumeist negativ mit „Unterdrückung“ und „Gewalt“ konnotiert sind. Hieran dürfte sich im Rahmen dieses Papers auch erklären, weshalb in den Theorien von Glasl und vor allem von Galtung keine Entwicklungshierarchien explizite Verwendung finden. Wilber, der sich oft der Kritik ausgesetzt sieht sein Modell sei „androzentrisch“, weil es Hierarchien über Heterarchien stelle, betont demgegenüber, dass Hierarchie und Heterarchie sowohl in normaler als auch in pathologischer Form auftreten können. Seine Verwendung des Hierarchiebegriffs würde von seinen KritikerInnen missverständlich mit „pathologischer Hierarchie“ verwechselt. Eine echte „Holarchie“ stehe aber für ein „ausgewogenes Verhältnis von normaler Hierarchie und normaler Heterarchie (vgl. Wilber 2005, S. 461f.).“ Es bleibt also festzuhalten, dass eine Anwendung von Holarchiemodellen (welche ein ausgewogenes Verhältnis von Hierarchie und Heterarchie vorsehen) vor allem in epistemologischer Hinsicht durchaus sinnvoll ist. Es wäre aber verfehlt, die vorherrschenden Vorbehalte in der Friedens- und Konfliktforschung gegenüber entwicklungshierarchischen Modellen einfach damit zu erklären, dass ihre VertreterInnen auf der Ebene des grünen Mems stehen geblieben sind. Vielmehr scheint das Entwicklungsebenenmodell, vor allem im heuristischen Kontext, einen begrenzten Nutzen aufzuweisen, wie im nächsten Kapitel noch näher aufzuzeigen.

Sieht man von diesen wichtigen Kritikpunkten ab, bietet ein Metamodell auf der Basis der AQAL-Kategorien einen anschaulichen (wenn auch zwangsläufig nicht allumfassenden) Metarahmen, der es erlaubt, die epistemologischen Schwerpunkte der beiden Theorien von Galtung und Glasl, mit besonderer Betonung auf ihre wechselseitigen Schnitt- und Ergänzungspunkte, einander gegenüberzustellen.

Heuristischer Kontext

In Rahmen dieser Untersuchung wurde und wird von der Prämisse ausgegangen, dass es sich beim IA um eine Metatheorie mit einem epistemologischen – sprich: einen auf die philosophische Erkenntnis und Annahmenbildung bezogenen – Schwerpunkt handelt. Der IA umfasst keine Konflikttheorie, gleichwohl lässt sich – wie oben skizziert – eine sehr abstrakte Konfliktphilosophie ableiten, die daher begrenzten heuristischen Nutzen hat.

Im heuristischen Kontext zeigt sich das AQAL-Modell nicht nur als zu unkonkret für die Friedens- und Konfliktforschung, sondern auch als sehr begrenzt, da viele Kategorisierungs- und Integrationskontexte, die für die Friedens- und Konfliktforschung von Relevanz sind, nicht von seiner Schematisierung erfasst werden. So erweist sich das AQAL alleine z.B. als ungeeignet, Methoden nach ihrer Ausrichtung (z.B. prozess-, klient-, lösungsorientiert) oder ihrer Vorgehensphase (z.B. 1) Konfliktanalyse, 2) Interventionsplanung, 3) Aktion) einzuordnen. Daher erwies sich bei der Skizzierung eines heuristischen Grundgerüsts eine Ergänzung des AQAL-Modells um die Metakategorien der Ansätze von Glasl und Galtung als sinnvoll. Wie aber erwähnt, dürfte der Beitrag des hier skizzierten Modells eher beispielhaften, denn repräsentativ-verallgemeinerbaren Charakter haben. So ergeben sich durchaus vielfältige, in der weiterführenden Forschung zu erörternde, Veränderungs- und Ausgestaltungsmöglichkeiten des Modells – schon alleine für den Bereich der „Konfliktanalyse“.

Bei der Anwendung des IA deutet sich sein durchaus vorhandener, aber begrenzter heuristischer Nutzen (und darum die Notwendigkeit seiner Erweiterung), insbesondere im Kontext der Bearbeitung interpersoneller Konflikte an. Dies lässt sich nicht nur, wie eben angedeutet, auf einen Mangel an Metakategorien zurückführen, die auf spezifischen die Erfordernisse der Friedens- und Konfliktforschung zugeschnitten sind, sondern auch an der ausschließlich im Evolutionskontext interpretierten Ebenendimension. Der hiermit einhergehende begrenzte heuristische Nutzen dürfte vor allem mit der Problematik zusammenfallen, die sich mit der ebenenspezifischen Kategorisierung (kollektiver oder individueller) politischer Akteure ergibt: Haben z.B. „Terroristen“ immer einen Schwerpunkt auf dem roten Mem? Oder verortete sich der britische Premierminister Tony Blair während des Irakkriegs auf der Ebene Gelb? Lassen sich Weltkrisen überhaupt sinnvoll anhand eines „Meme-im-Krieg-Paradigmas“ erklären? Diese und andere politische Statements, die Wilber in seinen viel gelesenen Essays „Deconstructing the World Trade Center“ (2001b) und „The War in Iraq“ (2003c) und zuletzt auf einer Tagung des Integralen Forums (2009) tätigte, dürften sich zu Recht als umstritten erweisen. „Umstritten“, zumal sich aus dieser entwicklunsgorientierten Ebenenperspektive Konfliktakteure umso paradoxer verhalten können, je höher bzw. komplexer der Grad ihr Niveau Ebenenentwicklung ist – dieses hohe Ausmaß an Widersprüchlichkeit des Konfliktverhaltens räumte Wilber selbst vor allem für die höheren Ebenen, ab dem gelben Mem ein (vgl. ebd.). Doch selbst wenn (unabhängig von Wilbers umstrittenen Aussagen) dieser Ansatz der entwicklungsorientierten Akteursbewertung im Allgemeinen empirisch belegt sein sollte (wofür nach Wilber eine Fülle empirisch-klinischen Materials spricht[13]), so dürfte es sich in der Praxis der Konfliktanalyse als sehr aufwändig erweisen, alle Testverfahren zur Ermittlung der jeweiligen Bewusstseinsebene auf jeder Entwicklungslinie umzusetzen. Gegen die Wilber-typische Verwendung des entwicklungsorientierten Ebenenmodells sprechen also in erster Linie praxisrelevante Gründe. Die eskalationsorientierte Verwendung – wie sie in den Grafiken 7 und 8 skizziert sind – dürfte sich hingegen bei der Bearbeitung gewalthaltiger Inter-Gruppen- und -Personenkonflikte als heuristisch angemessener erweisen. Dies begründet sich schon alleine mit der sehr einfachen empirischen Erhebbarkeit praxisrelevanter Konfliktphasen wie „Vor“, „Während“ und „Nach der Gewalt“. Da sich aber beide Ebenenmodelle – sprich: des Wilber-typischen Entwicklungskontextes und des eher in der Friedens- und Konfliktforschung vorherrschenden Eskalationskontextes – nicht widersprechen, dürfte aber eine integrierend-verknüpfende Betrachtung beider Modelle für eine transdisziplinär ausgerichtete Friedens- und Konfliktforschung durchaus von weiterführendem Forschungsinteresse sein.

Aus einer anderen pragmatisch-strategischen Perspektive fragt sich, ob und inwieweit „simplifizierende“, also: „gewollt reduktionistische“, Metatheoriebildungen für die Konfliktbearbeitung sinnvoll sind. So betont z.B. der Ansatz der systemischen

---

[13] Er führt z.B. Piagets méthode clinique, Mahlers auf Video dokumentierte Beobachtungen, Loevingers Tests der Selbstentwicklung, Kohlbergs und Gilligans moralische Untersuchungen auf der Grundlage empirischer Befunde bis hin zur „Fülle phänomenologischer Evidenz aus den großen kontemplativen Weisheitstraditionen“ an (vgl. Wilber 2005, S. 271).

Konflikttransformation der Organisation Berghof Peace Support (BPS), dass in der Praxis der Konfliktbearbeitung nur sehr begrenztes Wissen über den Konflikt zur Verfügung stehen und trotzdem aber Lösungsansätze gefunden werden müssen; dies gelte vor allem für komplexe innerstaatliche Gewaltkonflikte. Daher sehe dieser Ansatz nicht nur vor, die Komplexität des Konflikts angemessen zu erfassen („complexify"), sondern auch, diesen auf seine bearbeitbaren, systemischen Variablen zu reduzieren („symplify"), um „Hebelwirkungen" auszumachen, die zur Konfliktlösung beitragen (vgl. BPS 2006). Während sich also der epistemologische Metatheoriekontext durch einen Umgang mit Komplexität auszeichnet, der Reduktionismen so weit wie möglich zu vermeiden versucht, stellt sich aus einer praxisorientierten Metaperspektive der Konfliktbearbeitung die Frage, ob und inwieweit nicht ein ausgewogeneres Verhältnis von „complexify <-> simplifiy" angemessen wäre. Ein wahrhaft integrierter Metaansatz der Konfliktbearbeitung müsste in diesem Kontext also komplexifizierende *und* simplifizierende Ansätze zu integrieren. An dieser Stelle ergeben sich viele weiterführende heuristische Fragen, die im Rahmen dieser Arbeit nicht geklärt werden können, wie unter anderem: Wann, wo und inwieweit ist es sinnvoll, in einer integralen Konfliktbearbeitung aus pragmatisch-ressourcenorientierten Kalkülen Prioritäten zu setzen? Ist es z.B. legitim, langwierige und schwer greifbare Variablen, wie z.B. kulturelle Gewalt (UL) kurzfristig auszublenden, um sich kurzfristig lieber an „greifbarere Faktoren" (UR, OR) zu halten? Ist eine Simplifizierung des Konflikts auf seine relevanten (?) bearbeitbaren Elemente aus einer integral-heuristischen Perspektive zulässig?

„Integration" bzw. „Metatheoriebildung" stellen in praxisbezogeneren Kontexten keinen Selbstzweck dar. Vielmehr deutet sich an, dass sich in Metakontexten, in denen konkrete Problemlösungen gefragt sind (nicht nur die reine Erkenntnisgewinnung) pragmatische Kalküle die „Integrationslogik" entscheiden, abhängig von den spezifischen Ressourcen und Erfordernissen der Konfliktsituation sowie der Intuition der KonfliktbearbeiterIn. Hierunter dürften nicht nur die oben erwähnte Strategie der Simplifizierung von Komplexität zählen, sondern auch eklektizistische Herangehensweisen, verstanden als: „das zu verwenden, was funktioniert". Dies würde im Umkehrschluss für die Metatheoriebildung bedeuten, dass es in konkreten anwendungsbezogeneren Kontexten nicht immer darum geht, ganze Theorien und Methoden zu integrieren (an anderer Stelle in diesem Paper fragte sich kritisch, ob und inwiefern es überhaupt möglich ist, Glasl und Galtung zu „integrieren"), sondern nur bestimmte Aspekte, die sich der spezifischen Situation umsetzen lassen und in der Praxis bewähren. Diese Überlegungen dürften nur eine grobe Ausgangsbasis für den in weiterführenden Publikationen noch zu erforschenden Bereich einer Metapraxeologie integraler Konfliktbearbeitung liefern. Ausblickend deutet sich an dieser Stelle an, dass das Gesamtspektrum zwischen Metatheoriebildung (einschließlich Erkenntnistheorie und Heuristik) und Metapraxeologie (konkrete integrale Anwendungspraxis) „blinde Flecke" aufweisen dürfte. Dieses große Unbekannte zeigt sich insbesondere darin, dass die Gemeinsamkeiten und Ergänzungspunkte, die sich z.B. im epistemologischen AQAL so elegant darstellen lassen, in der Praxis der Konfliktbearbeitung in dieser Form nicht unbedingt bestätigen müssen. Lassen sich dialogisch-konstruktive Konfliktbearbeitungsmethoden, wie z.B. die Harvard-Mediation, Aufstellungsmethoden, Psychodrama, der Transcend-Dialog und Gewaltfreie Kommunikation in der Praxis wirklich „integrieren"? Inwiefern und wann lohnt es sich unterschiedliche Methoden eher „synchron" (sprich: gleichzeitig) oder eher „ad hoc" (sprich: sequenziell) zu kombinieren? Wie „reagieren" diese Methoden (in positiver und negativer Hinsicht) aufeinander? Diese und andere Fragen in spezifischen Konfliktsituationen zu erforschen, wie gesagt, weiterführenden Studien vorbehalten.

In heuristischer Hinsicht besteht also insgesamt vor allem die Herausforderung der

- Formulierung von Metakategorien, die für die Friedens- und Konfliktforschung relevant sind und das AQAL-Modell sinnvoll ergänzen können (z.B. allgemeine Operationalisierungsschritte der Konfliktbearbeitung);
- kritischen Hinterfragung bestehender AQAL-Dimensionen auf ihren pragmatischen Nutzen hin und ihrer Anpassung an die spezifischen (praxisbezogenen) Erfordernisse der Friedens- und Konfliktforschung und
- der situationsabhängigen Festlegung des angemessenen Verhältnisses von pragmatisch und (erkenntnis-)theoretisch begründeten Ansprüchen, wie z.B. dem Stellenwert simplifizierender oder/und eklektizistischer Strategien im Umgang mit Komplexität.

Fazit

Am Beispiel der Konflikttransformation von Galtung und dem Konfliktmanagement von Glasl wurde im Abgleich mit dem IA ein konzeptioneller Vorschlag zur epistemologischen und die heuristischen Integration unterschiedlicher Methoden mediativer Konfliktbearbeitung skizziert. Hierbei gestalteten sich die vertikal (Ebenen) und horizontal designten Metakategorien des AQAL-Modells (Quadranten, Typen, Linien) als hilfreich. Ein gegenseitiger Ergänzungspunkt von weiterem Forschungsinteresse bietet sich bei der kombinierten Berücksichtigung eines vertikalen Spektrums von Eskalationsstufen (Glasl) und eines horizontalen Rasters von mehreren Gewaltbereichen (Transcend). Insgesamt führte die Untersuchung zu einer Aufdeckung von Dimensionen, die im heuristischen Kontext der Friedens- und Konfliktforschung erforderlich sind, aber im eher epistemologisch ausgerichteten AQAL-Modell nicht in den Vordergrund gestellt wurden. Es bieten sich insgesamt, vor allem im für die Friedens- und Konfliktforschung unerlässlichen Kontext der heuristischen Metatheoriebildung, Ergänzungs- und Weiterentwicklungsmöglichkeiten für das AQAL-Modell.

Insgesamt lassen sich am Beispiel des AQAL-Modells im Wesentlichen folgende Herausforderungen für die Metatheoriebildung zusammenfassen:

- Die Metatheoriebildung eröffnet Chancen, wissenschaftliche Diskurse auf mehreren Ebenen zu führen. Gleichzeitig birgt sie vielfältige Herausforderungen, da sich diese Diskurse (und ihre Lösungen) nun als wesentlich komplexer gestalten.
- Auf der metatheoretischen Ebene gilt es stets zu berücksichtigen, dass Metaansätze – hier z.B. das AQAL-Modell – stets zwangsläufig begrenzte Wahrnehmungsrahmen aufweisen, die sich durch alternative Perspektiven ergänzen lassen. Eine „Theorie von Allem“ ist, wenn sie frei von Immunisierung und Ideologisierung sein soll, nicht möglich. Es zeichnen sich daher nicht nur Spannungsfelder zwischen dem metatheoretischen und dem theoretischen, sondern auch innerhalb beider Bereiche ab.
- Daneben ist entscheidend, unterschiedliche Kontexte der Metakategoriebildung zu unterscheiden, mit jeweils unterschiedlichen (hier z.B. epistemologischen und pragmatisch-heuristischen) Ansprüchen und „Integrationslogiken“. D.h. im weitesten Sinne zeichnen sich auch noch Spannungsverhältnisse zwischen Metatheorie und Metapraxeologie ab, die für die weiterführende Forschung von Interesse sein dürften.

– Eine wirklich integriert arbeitende Friedens- und KonfliktforscherIn müsste sich also im Idealfall sowohl im epistemologischen, wie auch im heuristischen, im metatheoretischen und im theoretischen, aber auch im metapraxeologischen und im praxeologischen Bereich sicher bewegen können.

Evolutionary Psychology as a Metatheory for the Social Sciences

Annemie Ploeger[1]

Abstract: Evolutionary psychology has been proposed as a metatheory for the social sciences. In this paper, the different ways in which scholars have used the concept of a metatheory in the field of evolutionary psychology is reviewed. These different ways include evolutionary psychology as a unification of different subdisciplines, as a nomological network of evidence, as Lakatosian hard core, as a tool for conceptual integration, and as a theory that addresses the major issues in the social sciences. It is concluded that evolutionary psychology has been successful as Lakatosian hard core, that is, it has been fruitful in generating new hypotheses. However, it has been less successful in unifying different subdisciplines. It is also concluded that evolutionary psychology needs to broaden its scope by including insights from evolutionary developmental biology in order to become a unifying framework for the social sciences.

Keywords: Evolutionary developmental biology, evolutionary psychology, metatheory.

Introduction

Evolutionary psychology is psychology that is informed by theory and research of evolutionary biology, with the idea that knowledge about the evolutionary background of psychological phenomena will contribute to the understanding of these phenomena (Cosmides, Tooby, & Barkow, 1992). The main tenet of evolutionary psychology is that the mind consists of a set of information-processing mechanisms, which have evolved by natural selection. These mechanisms are adaptations that are functionally specialized to deal with problems in particular circumstances, and therefore must be content-specific and richly structured (Tooby & Cosmides, 1992).

It has been argued that evolutionary psychology may provide a metatheory for psychology and the other social sciences (Buss, 1995; Cosmides, Tooby, & Barkow, 1992). Evolutionary psychology is considered to be an overarching theory whose principles can be applied to all fields in the social sciences (Duntley & Buss, 2008). In the present article, I review the different ways in which researchers have used the concept of a metatheory in the field of evolutionary psychology. In addition, I evaluate whether these attempts have resulted in the desired metatheory for the social sciences.

---

[1] **Annemie Ploeger** (1973) received her PhD degree at the University of Amsterdam in 2008. Chapters of her thesis *Towards an Integration of Evolutionary Psychology and Developmental Science: New Insights from Evolutionary Developmental Biology,* were published in Psychological Inquiry, Psychiatry Research, and Biological Psychiatry. After being a visiting scholar at the University of California, Los Angeles, she now works as an assistant professor in Developmental Psychology at the University of Amsterdam.

Different Ways to Use Evolutionary Psychology as a Metatheory

Several authors have contributed to the discussion on the metatheoretical status of evolutionary psychology. In this section I give an overview of these contributions, and I discuss whether these contributions are useful in achieving the desired metatheory for the social sciences.

Evolutionary Psychology Can Unify Different Subdisciplines in Psychology

Buss (1995) argued that evolutionary psychology could be a metatheory for psychology. Psychology is currently in conceptual disarray, with each branch, such as social, developmental, or organizational psychology, working on its own mini-theories. There is no overarching theory that integrates or unites the empirical findings in the different subdisciplines. Behaviorism used to be a metatheory for psychology, but explaining human behavior and cognition only by stimulus-response relationships appeared to be a too simple picture of how the mind works (e.g., Seligman, 1970). In response to behaviorism, cognitivism arose and claimed that the human mind consisted of information-processing mechanisms that could be compared to the working of a computer. But also the mind-as-a-computer appeared to be an oversimplified metaphor (e.g., Searle, 1990). Evolutionary psychology may fill the remaining hole by offering the process of natural selection that applies to any part of nature, as a unifying construct in social science.

The metatheory of evolutionary psychology that Buss (1995) proposed, consists of a hierarchy of levels of analysis. At the top of the hierarchy is general evolutionary theory, as represented by inclusive fitness theory (Hamilton, 1964). Inclusive fitness refers to the fitness of a genotype measured not only by its effects on an individual who possesses the genotype, but also by its effects on genetically related individuals. Inclusive fitness theory predicts that organisms behave to maximize their inclusive fitness. Evolutionary psychologists assume that this general theory is correct, and do not test this general theory directly. However, this does not imply that this general theory remains untested. Inclusive fitness theory has been tested by thousands of evolutionary biologists, in field experiments, lab experiments, and with computer simulations; thousands of tests have confirmed inclusive fitness theory, so this theory is broadly accepted by scientists (Buss, 1995).

Evolutionary psychologists do test theories that are derived from inclusive fitness theory, such as the theory of reciprocal altruism (Trivers, 1971) and the theory of parental investment (Trivers, 1972). Buss (1995) referred to these theories as middle-level evolutionary theories. From these middle-level theories, specific hypotheses and predictions can be derived. These predictions can be tested by "normal" scientific procedures, such as experiments, questionnaire methods and psychophysiological techniques.

Buss (1995) outlined what evolutionary psychology can contribute to research questions on social, personality, developmental, and cognitive psychology. For example, evolutionary psychology may be a fruitful approach for social psychologists that work on the issue of alliance formation and friendships. Based on reciprocal altruism theory, it is predicted that humans will form alliances and friendships with unrelated individuals, but only if the costs are less than or equal to the benefits. In a recent paper, Duntley and Buss (2008) go even further and argued that:

> evolutionary psychology also unites the field of psychology with all the other life sciences, including biology, economics, political science, history, legal scholarship, and medicine; it unites humans with all other species, revealing our place in the grand scheme of the natural world. (p. 31)

According to evolutionary psychologists, the key research issue that all psychologists (and social scientists in general) should address is the identification of adaptive problems that humans had to deal with repeatedly over our evolutionary history, in order to learn what the mechanisms of the mind are "designed" to do. This claim is in accordance with Daniel Dennett's (1995) *Darwin's Dangerous Idea*, the idea that natural selection is the central process in any complex form alive on earth. Because human behavior and cognition can be considered to be complex, the origin of most human behavior and cognition can be explained by referring to natural selection, including social behavior, community behavior, personality, and psychological disorders.

Today, fifteen years after the publication of Buss' (1995) proposal, how far are we away from a bridge between the different subdisciplines in psychology? Evolutionary psychology as a new approach has been successful, with hundreds of new discoveries that had eluded other psychologists (e.g., Buss & Reeve, 2003). For example, the work of Daly and Wilson (1985) on stepparenthood and the increased risk of child abuse is inspired by and congruent with inclusive fitness theory. However, being empirically successful is not the same as providing a unification of different subdisciplines. In the last fifteen years, evolutionary psychology appeared to develop into a successful approach, but more or less separately from the other subdisciplines. It has become a subdiscipline by itself. Why did it turn out that evolutionary psychology has not been embraced as the metatheory that unites all subdisciplines in psychology?

One major reason is that evolutionary psychology has met with substantial criticism (e.g., Davies, 1996; Fodor, 2000; Lewontin, 1998; Looren de Jong & van der Steen, 1998; Richardson, 1996). For example, Lewontin (1998) argued that we will *never* know how our cognition evolved, because it is impossible to collect the necessary evidence. Cognition does not fossilize, and our ancestors (e.g., *Homo habilis*, *Homo erectus*) are extinct so we have no recent sister species with which we can compare our cognition. According to Lewontin, these kinds of evidence are necessary to decide whether a given psychological mechanism is an adaptation or not. If it is not possible to collect the necessary evidence, then the whole enterprise of evolutionary psychology will be a failure, and the desired metatheory is still far away. In response to these criticisms, different approaches to evolutionary psychology as a metatheory have been formulated. One is evolutionary psychology as a nomological network of evidence.

Evolutionary Psychology as a Nomological Network of Evidence

According to evolutionary psychologists, it is not impossible to provide empirical evidence for the existence of evolved psychological mechanisms. One way to solve this problem is creating a nomological network of evidence (Schmitt & Pilcher, 2004). Evolutionary psychologists collect data from a wide variety of sources, which together provide evidence for the putative adaptation. In order to conclude that a psychological mechanism has evolved by natural selection, Schmitt and Pilcher recommend collecting data from eight different sources. First of all, there has to be a theory, grounded in evolutionary biology, cost-benefit analyses, and/or computer simulations. The next step is to provide psychological evidence, with methods accepted by psychologists, such as experiments or surveys. In addition, one needs medical evidence, for example from fertility and fecundity studies. Next, physiological evidence is required, for example from neurobiological research. Genetic evidence can be collected by means of behavioral or molecular genetics studies. Phylogenetic evidence can be found by means of comparative or paleontological methods. Hunter-gatherer data can be collected with cultural anthropological research. In addition, cross-cultural evidence can be gathered with ethnological comparisons or with a search for human universals. By collecting data from several sources, a nomological network can support evolutionary hypotheses about the human mind.

For example, Schmitt and colleagues (2003) have argued that there is a sex difference in desire for sexual variety, and that this sex difference is an adaptation. In general, men tend to long for more sexual short-term relationships than women. This hypothesis is derived from parental-investment theory, which is grounded in evolutionary biology. Schmitt and colleagues gathered data from 52 nations on 6 different continents and provided cross-cultural evidence for this hypothesis. There is also ample psychological evidence (based on surveys, behavioral experiments, etc.); comparative studies have shown the same tendency in nonhuman species (i.e., phylogenetic evidence), and physiological studies have indicated that testosterone and morphological characteristics play a role in the manifestation of this adaptation. Many pieces of evidence have been collected so far, although some components of a full evolutionary explanation are missing, but future studies may fill this gap.

This example shows that it is possible to provide evidence for an evolutionary hypothesis, but it also shows that an ambitious research program is necessary in order to create a satisfying nomological network. However, the question remains whether nomological networks of evidence for certain individual hypotheses provide a metatheory for psychology. A nomological network of evidence can provide support for the existence of a psychological adaptation, and this shows that the framework of evolutionary psychology has scientific value. However, such a nomological network of evidence does not show that all other researchers in the social scienes should use evolutionary psychology as their metatheory. A related proposal about evolutionary psychology as a metatheory, based on Lakatosian philosophy of science, may provide insight in this issue.

Evolutionary Psychology as Lakatosian Hard Core

It has been argued that evolutionary psychology can be a metatheory by providing a set of consensually held assumptions that lead to the generation of new theories and hypotheses (Ketelaar & Ellis, 2000). Philosopher of science Lakatos (1970) called these assumptions the hard core of a metatheoretical research program. The hard core operates like a map - it shows which roads to take and which roads to avoid; it provides heuristics, which narrow the scope of research to a set of plausible a priori hypotheses. The hard core of evolutionary psychology is represented by Hamilton's (1964) inclusive fitness theory, which is assumed to be true. This assumption is not just a belief - it is grounded in the myriad of empirical findings that evolutionary biologists gathered in favor of inclusive fitness theory. The auxiliary hypotheses - the protective belt, in Lakatosian terms - are subject to empirical testing. Metatheories are evaluated by the performance of the protective belt. If the metatheory generates new hypotheses and explanations, then the metatheory is judged to be progressive; if not it is judged to be degenerative.

As was argued before, evolutionary psychology has been a fruitful empirical approach, with many new discoveries and explanations (Buss & Reeve, 2003). In this sense it has been a progressive metatheory. So if we adopt a Lakatosian view of a metatheory, evolutionary psychology is evaluated as a fruitful metatheory. However, it is still problematic that evolutionary psychology so far is more a subdiscipline on its own, rather than an integrative, overarching theory for the social sciences. This leads to the following intriguing suggestion: the generation of novel hypotheses may lead to the creation of more areas of investigation, which results in the development of more subfields and eventually to an increasing fragmentation of the science, rather than a unification of different fields. Although it is hard to prove this idea, it may lead to the conclusion that a hard core theory that generates many novel hypotheses is not necessarily a metatheory that should be used by all social scientists. A good metatheory is a framework that all social scientists use to evaluate their theories. There are two approaches to evolutionary psychology as a metatheory that have not been described yet, which may offer a way out of the isolation of evolutionary psychology from other scientific disciplines.

Evolutionary Psychology Provides Conceptual Integration

It has been suggested that evolutionary psychology may be a metatheory for psychology by providing *conceptual integration*, or *vertical integration*, that is, the principle that all scientific disciplines should be mutually consistent (Cosmides, Tooby, & Barkow, 1992). In the natural sciences, different disciplines are already mutually consistent, for example, the laws of chemistry are compatible with the laws of physics. Cosmides and colleagues argued that in the social sciences compatibility is lacking, leading to theories that contradict each other and leading to theories that may not be feasible from an evolutionary point of view. Conceptual integration may lead to the solution of problems in one's own discipline by adopting methods and knowledge from other disciplines:

> Evidence from evolutionary biology can help social psychologists generate new hypotheses about the design features of the information-processing mechanisms that govern social behavior; evidence about cognitive adaptations can tell evolutionary biologists something about the selection pressures that were present during hominid evolution; evidence from paleoanthropology and hunter-gatherer studies can tell developmental psychologists what kind of environment our developmental mechanisms were designed to operate in; and so on. (Cosmides, Tooby, & Barkow, 1992, p. 12)

The proposal that evolutionary psychology can provide conceptual integration has been challenged by Looren de Jong and van der Steen (1998). They argued that evolutionary biology does not provide any laws, such as laws in physics or chemistry. Concepts such as adaptation and fitness are not fixed entities covering general patterns of evolution. Whether one calls a trait an adaptation depends on the criteria that one sets for an adaptation. These criteria are still highly debated in evolutionary biology (e.g., Brandon, 1990). Looren de Jong and van der Steen argued that evolutionary biology is not united at all, and it does not provide causal laws of hard science, so it cannot bring conceptual integration.

Lickliter and Honeycutt (2003) argued that psychology could be conceptually integrated with evolutionary biology, but that conceptual integration failed because evolutionary psychology so far has focused too much on inclusive fitness theory, a gene-centered theory. It would be more fruitful for psychology to focus on developmental systems theory. Developmental systems theorists do not view the gene as the center of evolution, but the whole developmental system at all its levels: molecular, cellular, physiological behavioral and environmental (see also Gottlieb, 2000). A true evolutionary metatheory for the social sciences should not only include inclusive fitness theory, but also an integration of the fields of genetics, embryology and developmental biology.

So far we can draw three conclusions with regard to the metatheoretical status of evolutionary psychology, one positive and two negative. The positive conclusion is that evolutionary psychology has been fruitful as a Lakatosian metatheory that generates new discoveries and explanations. A negative conclusion is that this metatheory has not resulted in a unification or conceptual integration of different scientific areas. This may be a natural consequence of having a successful theory that leads to the generation of novel hypotheses, which in turn leads to new fields of investigation, rather than an integration of fields. Another possibility is that the absence of unification is the result of the scope of the metatheory of evolutionary psychology. The scope of evolutionary psychology is inclusive fitness theory, and this scope may be too narrow to function as a metatheory for the social sciences. So the third conclusion is that if evolutionary psychology is the desired metatheory for the social sciences, then it may be necessary to broaden its scope in order to reach unification of different fields. These preliminary conclusions lead to a last approach to evolutionary psychology as a metatheory: evolutionary psychology is a metatheory for the social sciences if it cannot only generate new hypothesis, but it should also be able to address the main theories, or metaissues in the field, for example, the nature-nurture debate.

Evolutionary Psychology as a Metatheory that Addresses the Major Issues in the Social Sciences

Another approach to evolutionary psychology as a metatheory is that it should contribute to the major issues in the field (Ploeger, van der Maas, & Raijmakers, 2008). With regard to psychology, the major issues can be formulated as:

- Is the human mind mostly modular, or is the mind domain-general?
- What is the influence of nature and nurture on the human mind?
- Does development proceed in stages or gradually?
- How do individual differences arise?

My colleagues and I have argued that the contribution of the current metatheory of evolutionary psychology, that is, inclusive fitness theory, to these major question is too limited. With regard to the first question, evolutionary psychologists have argued that the mind is most likely to be modular, because modularity is a more efficient way to solve problems than a domain-general problem-solver (e.g., Cosmides & Tooby, 1994). However, this argument leaves unexplained the existence of several domain-general abilities (for an overview, see Ploeger et al., 2008).

With respect to the nature-nurture debate, evolutionary psychologists have explained why it is likely that the mind consists of many evolved psychological mechanisms, but they have so far not developed models that can account for the interaction or transaction between the genome and the environment. Evolutionary psychologists have not discussed the question whether development proceeds in stages or gradually, and from inclusive fitness theory alone it is not straightforward how the present metatheory of evolutionary psychology can contribute to this issue. With regard to the question about individual differences, evolutionary psychology so far has focused on discovering human universals, leaving the question about individual differences unanswered (e.g., Tooby & Cosmides, 1990), although there have been some evolutionary psychologists who have tried to address this issue (e.g., Buss, 2009; Wilson, 1994).

My colleagues and I have argued that evolutionary psychology should broaden its scope in order to become a fruitful metatheory that can address all the basic issues (Ploeger et al., 2008). We argued that theories and empirical findings from evolutionary developmental biology should be included in the metatheory, and we showed that this inclusion leads to new insights that contribute to the major debates in psychology. Evolutionary developmental biology is an approach that forges a synthesis of processes operating during individual development with those operating between generations (Carroll, 2005; Hall & Olson, 2003). This approach has led to a wealth of theories and empirical findings that are highly relevant to psychology, but have yet to be integrated. For example, with regard to the question whether the human mind is modular, there has been a lively debate among evolutionary developmental biologists about the role of modularity in evolution. Recent findings have shown that under some specific conditions modularity is more likely to evolve, while under other conditions there will be less modularity (Griswold, 2006). These findings can be used to explain the co-existence of modular and more domain-general structures in the human mind.

With respect to the nature-nurture debate, models that include both genetic and environmental factors have been studied extensively in the field of evolutionary developmental biology. These models can result in new insights for psychology, for example that there must exist a third source of variance, besides genes and environment, that consists of self-organized processes (Molenaar, Boomsma & Dolan, 1993). Research has shown that there is still considerable variation in body weight of mice, although their genetic makeup and their food intake are kept constant (Gaertner, 1990). This points in the direction of a third source of variance, for which models in evolutionary developmental biology provide an explanation (e.g., Kauffman, 1993). In addition, there has been ample research from an evolutionary developmental perspective on stages or phase transitions and their importance for development and evolution (e.g., Stadler, Stadler, Wagner, & Fontana, 2001). Also research on individual differences is abundant in evolutionary developmental biology (e.g., Zhang & Hill, 2005).

Thus, by broadening the scope of evolutionary psychology, it is possible to give a unique view on the major issues in psychology, by integrating psychology and insights from evolutionary developmental biology.

Discussion

It has been argued that evolutionary psychology could be a metatheory for the social sciences (e.g., Buss, 1995). In this paper, an overview of different arguments has been given, and the value of these arguments has been evaluated. Buss (1995) argued that evolutionary psychology could unify the different subdisciplines of psychology that so far have worked in isolation. The metatheory that could establish this unification was inclusive fitness theory (Hamilton, 1964). However, so far evolutionary psychologists have not been able to bridge the gap between different research areas.

First of all, it could be argued that we should not desire to build a metatheory that connects all areas in psychology and the social sciences. It may be impossible to have such as overarching theory, because the different areas in psychology and the social sciences are too specialized and address too many different questions. In addition, mini-theories and individual empirical findings have their own merit, and should not be disregarded.

Second, if we believe that a metatheory is desirable, it could be argued that unification of different disciplines should not be the main aim of a metatheory. Instead, it could be argued that the main aim of a metatheory is to evaluate different theories within a field. For evolutionary psychology, this would imply that its framework can be used to evaluate theories such as Skinner's learning theory, Piaget's developmental theory and Festinger's theory of cognitive dissonance. These theories should be consistent with the principles of evolutionary theory. This idea is closely related to the proposal of Cosmides, Tooby and Barkow (1992), who have argued that evolutionary psychology can provide conceptual integration, that is, it can make the social sciences more consistent with each other and the natural sciences. However, a problem with this view is that evolutionary biology does not provide laws, like physics and chemistry do, and that it is not clear whether evolutionary biology is united itself, so it cannot provide conceptual integration (Looren de Jong & van der Steen, 1998).

Evolutionary psychology has met other criticisms. For example, it has been argued that evolutionary psychologists cannot provide empirical evidence for the theory that the mind consists of many evolved psychological mechanisms, or adaptations (Lewontin, 1998). However, it is possible to provide this evidence by means of nomological networks of evidence (Schmitt & Pilcher, 2004). But this may lead to the argument that a nomological network of evidence does not provide a metatheory, but that such a network can be used to evaluate hypotheses that are related to the metatheory. In terms of Lakatosian philosophy of science, the nomological network of evidence is the protective belt of the metatheory, not the metatheory itself.

It has been proposed that evolutionary psychology should be perceived from the perspective of Lakatosian philosophy of science (Ketelaar & Ellis, 2000). A metatheory from this perspective is defined as a set of consensually held assumptions that lead to the generation of new theories and hypotheses. For evolutionary psychology, these consensually held assumptions are the basic tenets of evolutionary theory, or more specifically, inclusive fitness theory. Because inclusive fitness theory has been confirmed thousands of times by evolutionary biologists, it can be assumed that this theory is correct. Evolutionary psychology has been a fruitful approach to generating new hypotheses (Buss & Reeve, 2003), so in the Lakatosian sense, evolutionary psychology is a true metatheory. The hard core, that is, inclusive fitness theory, is protected by the protective belt of confirmed hypotheses. However, the hard core of evolutionary psychology has not led to the unification of different fields. It may be that the generation of novel hypotheses leads to the creation of more different areas of investigation, and thus to more fragmentation, instead of unification.

A last approach to evolutionary psychology as a metatheory is based on the idea that a metatheory should contribute to the major issues in a field. Ploeger, van der Maas and Raijmakers (2008) have argued that inclusive fitness theory alone cannot provide a satisfying contribution to the major issues in psychology, but that evolutionary psychology needs to broaden its scope. Possibilities are the inclusion of dynamical systems theory (e.g., Kenrick, 2001), evolutionary game theory (Nowak, 2006), evolutionary cognitive neuroscience (e.g., Platek, Keenan, & Shackelford, 2007), and evolutionary developmental biology (e.g., Ploeger et al., 2008). We have focused on the last approach, and we have shown that if evolutionary psychology is willing to include theories and empirical findings from evolutionary developmental biology, it can give a unique view on the major issues. If evolutionary psychology can give answers to the questions that have occupied the minds of psychologists for so long, it may truly become a unifying framework for the social sciences.

Toward a Metatheoretical Integration of Developmental Paradigms

Mark W. Antley[1]

Abstract: This paper shows how a partial consilience might be achieved in the field of human development by means of principles from general systems theory. The author concurs with Sameroff (1989) that it is possible to interpret the mechanistic, organisimic, and contextualist paradigms/worldviews (Goldhaber, 2000; Pepper, 1970) in terms of general systems theory. The author selects a major developmentalist from each paradigm and interprets that scholar's work in terms of systems principles. The following developmentalists were selected: Arnold Sameroff (contextualism), Erik Erickson (organicism), and Albert Bandura (mechanism). The systems principles employed are *wholeness and order*, *self-stabilization*, *self-reorganization*, *hierarchical interaction*, and *dialectical contradiction* (Sameroff, 1989). The author addresses the conflicting presuppositions of the major paradigms in order to provide for their theoretical subsuming under systems theory. Finally, the author notes areas of inconsistency that will need to be resolved in the future and calls for further scholarship to translate developmental theory in terms of general systems theory for the benefit of students, scholars, consultants and other practitioners familiar with systems theory.

Keywords: Contextualism, developmental systems, general systems theory, mechanism, organicism.

Interpreting Human Development In Terms of Systems Theory

The field of inquiry that studies and theorizes about human development is fragmented. There is no "Big Bang" theory of human development to form the basis of a general consensus nor is there a universally accepted paradigm to guide research. In an effort to integrate the diverse approaches to developmentalist scholarship, Goldhaber (2000) turned to Pepper's (1970) metatheoretical paradigms of *mechanism*, *organicism*, and *contextualism*. (See the appendix for more information on these paradigms). Subsuming a century of developmental research and scholarship under just three paradigms was a major achievement, but still, "this is not a very satisfying state of affairs" (Goldhaber, 2000, p. 10), since theories from one paradigm cannot be directly compared with theories from another paradigm because of conflicting assumptions underlying the various paradigms. Nonetheless, Goldhaber (2000) believed "a broad enough conceptualization" (p. 11) could unite the three paradigms into one.

SOME RIGHTS RESERVED

Perhaps such a conception exists, if only in embryo. As Laszlo (1996) has noted, “systems thinking gives us a holistic perspective for viewing the world around us, and seeing ourselves in the world. It is a way of organizing, *or perhaps reorganizing* [italics added], our knowledge in terms of systems, systemic properties, and inter-system relationships” (p. 16). In a similar vein, Sameroff (1989) writes:

> General systems theory may provide a framework for the combination of [mechanistic, organismic, and contextualist] models. . . . Within such a more general view, interpretations can be made as to why a system appears to function mechanistically from one perspective, organismically from a second perspective, [and] contextually from a third. (pp. 231-232)

Significant scholarship in each of the three major developmentalist paradigms is already based on systems theory, or can readily be interpreted in light of systems concepts. I wish to demonstrate that, in principle, contextualist, organismic, and mechanistic theories can be interpreted using systems principles. Achieving this would be a step in the direction of concillience and allow students, scholars and practitioners steeped in systems theory and systems perspectives to more readily apply the fruits of developmental scholarship to their research and praxis. To demonstrate this conclusively would require an exhaustive analysis and reinterpretation of developmental literature in each of the major developmental paradigms. The goal of this paper is more modest, to take the first tentative steps toward conscilience in developmental theory. Using systems principles, I will present and/or interpret the work of one scholar from each of the major developmentalist paradigms, following Goldhaber’s (2000) grouping of major developmental scholars into Pepper’s (1970) metatheoretical paradigms of *contextualism*, *mechanism*, and *organicism* . If this attempt is successful, future scholarship my expand on the approach taken here. We shall begin by examining systems thinking in contextualist research following Goldhaber (2000).

Contextualist Systems Thinking

According to Goldhaber:

> All developmental [paradigms] look at persons in context. Mechanists do so in a reductionist way that allows them to disentangle independent variables. Organicists do so in a holistic way that allows them to make universal claims about sequence. For contextualists, however, the phrase *person in context* has a somewhat distinct meaning. Specifically, the person and the context are not two discrete entities interacting in some fashion; instead they form one interdependent but ultimately temporary entity…. For contextualists this interdependence means that [human] development is best studied from a systems perspective. (p. 52)

One of the most straight-forward contextualist system thinkers that Goldhaber (2000) identifies is Arnold Sameroff. Being a systems advocate himself, it will not be necessary to reinterpret Sameroff’s work in terms of systems concepts as he has done so already.

Table 1. Theoretical Principles of Development (Note. Adapted from Sameroff, 1989)

General Systems	Developmental Systems
Wholeness & order	Continuity & identity
Self-stabilization	Development
Self-reorganization	Evolution
Hierarchical interaction	Discontinuity
Dialectical contradiction	Motivation

Sameroff (1989) applies general systems theory directly to human development. “Although there are a large number of . . . systems theories” writes Sameroff, “I have settled on five principles the capture the core issues in such perspectives [a] wholeness and order, [b] self-stabilization, [c] self-reorganization, [d] hierarchic interaction, and [e] dialectical contradiction” (pp. 220-221). He relates each of the selected general systems principles to an analogous developmental principle (see Table 1 above). We will look at each of these in turn beginning with wholeness and order.

Wholeness and order. “The reason that wholes are more than the sum of their parts,” explains Sameroff (1989), “is that relationships are added that can never be assigned to single elements” (p. 221). He goes on to elaborate that wholes and parts form a nexus wherein the parts constrain and define the whole even as the whole constrains and defines the parts.

Sameroff (1989) suggests “the developmental analog of wholeness and order is continuity and identity;” and “as in the organismic metaphor of the cell, continuity is in the relationship of the parts rather than in their specificity (p. 221).” Even more radically, he asserts that “a family is defined independently of the specific actors, although this definition is itself in flux with the evolution of serial parenting in multimarriage families” (Sameroff, 1989, p. 222). Let us now examine Sameroff’s treatment of *self-stabilization.*

Self-stabilization. In the open system of a living organism, self-stabilization is an ongoing process that involves both homeostasis and homerohesis (Waddington, 1962; Sameroff, 1989). Homerohesis, the process of stabilizing around a moving point, constitutes development inasmuch as new forms of organization are required to enable the system to function at higher levels that are not necessary inherent in the organism, but a functional synthesis of organism and environmental conditions. According to Sameroff (1989):

> What we observe as development is a product of self-stabilization. An active organism subject to an ordered series of perturbations will respond with an ordered series of adaptations. Most attention has been devoted to internal sources of perturbations, usually labeled as maturation. As the genotype regulates biological changes in the body, there is a continuous process of adaptation while each change is assimilated into the system’s functioning. . . . [Far] less attention has been paid to the ordered series of external

> perturbations that also serve to organize and regulate development. I have labeled the regulatory systems for experience the environtype. The environtype includes a developmental agenda for raising children in which graded changes in the child trigger changes in the environment [as controlled by parents, care-givers, and educators]. (p. 222)

Having seen how Sameroff has used the principle of *self-stabilization*, let us see how he employs the principle of *self-reorganization.*

Self-reorganization. The process of self-reorganization of an organism in response to environmental change is evolution (Sameroff, 1989). Sameroff cautions that evolutionary changes should not be interpreted to mean that the organism is becoming "better," but rather more adapted to its environment.

Consider the case of Andy Dufresne in Stephen King's 1994 motion picture, *The Shawshank Redemption*. Andy never committed a crime until after he was falsely convicted of his wife's murder. Once behind bars, he uses his knowledge of commerce and finance to create a false identity and bank accounts to launder the proceeds of graft and corruption, eventually embezzling the funds and escaping from the prison.

While we don't know for sure whether he would have eventually turned to crime, the natural interpretation is that he was driven to these uncharacteristic behaviors by his environment. Superficially, this may appear as a mere change in behavior, but surely there must be underlying psychological and personality changes as well. The principle of *self-reorganization* seems to be related to the principle of *hierarchical interaction* to be examined next.

Hierarchical interaction. Sameroff appeals to the general systems principle of *hierarchical interaction* to explain developmental discontinuities. Such discontinuities are a result of alternative descriptions of organic subsystems (Patee, 1973). Sameroff explains:

> Each part of a system has a number of properties that can place it in relation to other parts. . . . In a hierarchy, superordinate levels . . . only utilize some properties (i.e., alternate descriptions) of the subordinate level. . . . At the behavioral level society is composed of institutional [systems] composed of individual subsystems. [Individuals] are only valued if they fulfill some defined . . . role in the organization. Whether the individual is male or female, white or black, young or old, physically handicapped or retarded, may be relevant or irrelevant for certain role [descriptions]. Discontinuity is found when alternative descriptions are important in different social contexts or . . . developmental periods. (Sameroff, 1989, p. 225)

In some cases the discontinuities found as a result of *hierarchical interaction* might lead to *dialectical contradictions.*

Dialectical contradiction. Dialectical contradiction is the "motivational force" in behavioral change (Sameroff, 1989, p. 226) and psychological development (Piaget, 1971). Such contradictions arise naturally as a result of unintended, adverse consequences of actions.

Contradictions may also arise as a result of immature and/or incorrect understandings of objects in the environment of the organism.

> Equilibration is the result of an individual's efforts to overcome contradictions between the subject's cognitive organization and the object. Each assimilation requires some accommodation to occur because no two experiences are ever identical: and each new accommodation means that the next experience will be assimilated somewhat differently because the subject will have been changed. (Sameroff, 1989, pp. 226-227)

Sameroff is a thoroughgoing systems thinker who presents his theories in terms of systems concepts. Next we will look at a developmentalist from the organismic paradigm who does not claim to be a systems thinker, but who can be readily interpreted in those terms.

An Organismic Theory of Lifelong Development

I asserted earlier that significant work in each paradigm either employs systems thinking or can be interpreted from a systems perspective. In the last section we considered the former; in this one we shall attempt the latter, interpreting an organismic theory using the concepts of systems thinking. We will be looking at the work of one of the great psychodynamic theorists of organicism identified by Goldhaber (2000), Erik Erikson.

Erikson's Theory of Psychosocial Development

One of the appealing things about Erikson's work is that he considers human development to be a lifelong process. Trained as a psychoanalyst, Erikson articulated an original developmental theory based on epigenetic, psychodynamic, and sociological principles (Goldhaber, 2000).

Table 2. Erikson's Stages of Psychosocial Development (Note. Adapted from Erickson, 1997)

Stages	Psychosocial crisis	Significant relations	Basic strengths	Core pathologies
I Infant	Trust vs. mistrust	Maternal person	Hope	Withdrawal
II Toddler	Autonomy vs. shame, Doubt	Paternal persons	Will	Compulsion
III Preschooler	Initiative vs. Guilt	Nuclear family	Purpose	Inhibition
IV School age	Industry vs. Inferiority	School, neighborhood	Competence	Inertia
V Adolescence	Personal identity vs. role confusion	Peer groups, out groups, role models	Fidelity	Repudiation

VI Young adult	Intimacy vs. isolation	Friends, sexual partners	Love	Exclusivity
VII Mature adult	Generativity vs. stagnation	Coworkers, colleagues, members of household	Care	Rejectivity
VIII Older adult	Integrity vs. despair	Humanity (or ethnic group)	Wisdom	Disdain

His theory has eight stages (see Table 2) beginning with infancy with its focus on the maternal person and ending with old age with its greatly expanded focus on humanity (Erikson, 1997). Each stage has its central crisis. If the crisis is resolved positively, the individual will acquire the basic strength of that stage; a negative resolution engenders the core pathology of that stage. Each stage must be resolved, whether positively or negatively, before the next is entered. However, no resolution is final, both in that regression is possible, and that subsequent life events can lead to the revision of the resolution of a previous stage. Also each strength acquired at a prior stage must find a new expression in the current stage. For instance, the hope engendered in infancy should mature into faith in the older adult (Erikson, 1997).

Now let's examine Erikson's theory of psychosocial development from a systems perspective.

A Systems Interpretation of Erickson's Theory

We will interpret Erickson's theory of psychosocial development using the systems concepts discussed above in the section on Sameroff, namely (a) wholeness and order/continuity and identity, (b) self-stabilization/development, (c) self-reorganization/evolution, (d) hierarchical interaction, and (e) dialectical contradiction. We begin with wholeness and order.

Wholeness and order/continuity and identity. Physically, the system has a continuous discrete identity from birth to death of the organism. Psychologically, continuity is a function of memory and to some extent, imagination—both in the sense in which a child can imagine life as an adult and in the sense that an adult must psychically grapple with the impending existential discontinuity of death.

Psychologically, identity is more complex. Temporal succession notwithstanding, the different stages of ones life and the different roles one must play (lover, scholar, mother) are distinct; therefore a cohesive sense of personal identity is a construct that either coheres or crumbles depending as much on one's psychic fortitude as on the social storms and communal anchors one encounters in life. Now let us see how the principle of *self-stabilization* can be found in Erikson.

Self-stabilization/development. Each of Erikson's stages has two opposing attractors (an attractor being a point that draws the system to it): a positive one and a negative one. As the system first enters a stage it is unstable and of indeterminate valence (at least with respect to the current stage) because it is out of equilibrium, having not yet settled on either of the attractors. Development is the movement from an indeterminate state to a determinate equilibrium. If the system moves to a point of equilibrium around the positive attractor, the system can be said to have a positive valence; that is, the individual has a positive outlook and is psychologically healthy for the stage of life she is in.

So, if a toddler who left infancy well nurtured, hopeful, and trusting of her mother is subsequently orphaned and placed with authoritarian foster parents, she may resolve her next stage of development in a state of doubt with compulsive tendencies. This is a psychological development albeit a negative one. Having found the principle *self-stabilization* in Erikson, let us see how the principle of *self-reorganization* might be understood.

Self-reorganization/evolution. Over time the system loses its equilibrium, becoming unstable once more due to either endogenous or exogenous changes to the system. The attractor that previously held the system in equilibrium is no longer sufficient so the system reorganizes itself and must seek a new “higher” equilibrium. This change in state is what is meant by evolution.

Imagine a construction worker in his fifties who is in stage VII, middle adulthood. Now suppose he develops arthritis and other age-related physical conditions that force him to retire. Due to endogenous changes in his bodily subsystems he is compelled to evolve into stage VIII, older adult. Perhaps an engineer works for the same company who is also in her fifties. Due to an organizational restructuring, she is offered an early retirement package which she chooses to accept. In her case it was exogenous changes that lead to her evolving to stage VIII, but from a systems perspective it is irrelevant whether the evolution is caused by endogenous or exogenous changes. Let us now consider the systems principle of *hierarchical interaction.*

Hierarchical interaction. Erikson’s own words sound very much like a systems theorist at this point:

> [We] begin with the assumption that a human being’s existence at every moment [depends] on three processes of organization that must complement each other. There is…the biological process of the hierarchic organization of the organ systems constituting a body (*soma*); there is the psychic process organizing individual experience by ego synthesis (*psyche*); and there is the communal process of the cultural organization of the interdependence of persons (*ethos*). (pp. 25-26)

One may infer that the *psyche* mediates between the levels of *soma* and *ethos*, the hierarchical levels directly below and above it; the individual experiences input from both his body (e.g. in the form of hunger or sexual arousal) and from the culture (e.g. in the person of a parent, or priest) which must then be synthesized in some manner (e.g. I can eat *after* father says grace—or—I can discretely have sex with this partner, *but* I cannot marry her because she is not of my people.) Finally let’s look at *dialectical contradiction*.

Dialectical contradiction. Although he used different terminology, Erikson (1997) recognized the principle of dialectical contradiction at work in the process of *sublimation*, as this excerpt shows:

> [At present] *sexual frustration* is recognized as pathogenic, while *generative frustration*, [resulting from] the dominant technological ethos of birth control, is apt to remain unrecognized. Yet, sublimation, or a wider application, is the best use of frustrated drive energies. Thus…a new generative ethos may call for a more *universal care* concerned with…the lives of all children. (p. 68)

In this example the biological generative urge is dialectically contradicted by the technological ethos of birth control which leads to the (at least potential) synthesis of a universal care for the lives of all children. We turn now from one of the great organicists that Goldhaber (2000) classified to perhaps greatest mechanist he selected, Albert Bandura (It may be worth noting that Bandura's work may be regarded as either expanding or transcending the mechanist paradigm).

A System's Interpretation of Bandura's Mechanistic Social Learning Theory

Bandura has significant elements of systems thinking in his Social Learning Theory, perhaps most notably his concept of reciprocal determinism (see Figure 1). Reciprocal determinism means that both the person and the environment influence behavior, and vice-versa; the environment shapes the person, and the person shapes the environment (Bandura, 1977).

Bandura's Social Learning Theory

Reciprocal determinism and observational learning form the core of Bandura's (1977) Social Learning Theory. Simply put, observational learning occurs when persons respond with matching performances to events modeled in their environment. Observational learning has four sub-processes: *attentional, retention, motor (re)production, and motivational processes.*

*Attentional processes a*re a function of the modeling stimuli and observer characteristics (Bandura, 1977). Modeling stimuli are characterized by distinctiveness, affective valence, complexity, prevalence, and functional value. Observer characteristics include sensory capabilities, arousal level, perceptual set, and past reinforcement.

Retention processes. Retention of the modeled events by the individual is accomplished by *symbolic coding, cognitive organization, symbolic rehearsal, and motor rehearsal* (Bandura, 1977). The first three of these are cognitive processes; the last is a psychomotor process.

Motor (Re)production Processes. Motor (re)production is dependant on the individual's physical capabilities, availability of component resources, self-observation of reproduction, and accuracy of feedback (Bandura, 1977).

Motivational Processes include *external reinforcement, vicarious reinforcement, and self-reinforcement.* External reinforcement is traditional *Skinnerian* conditioning. The discovery of vicarious reinforcement was Bandura's major breakthrough. Self-reinforcement, whereby an individual internalizes standards of praiseworthiness, is also a significant motivational process, especially as the individual develops her own moral standards (Bandura, 1977).

Motor (Re)production Processes. Motor (re)production is dependant on the individual's *physical capabilities, availability of component resources, self-observation of reproduction, and accuracy of feedback* (Bandura, 1977).

Motivational Processes include *external reinforcement, vicarious reinforcement, and self-reinforcement.* External reinforcement is traditional *Skinnerian* conditioning. The discovery of vicarious reinforcement was Bandura's major breakthrough. Self-reinforcement, whereby an individual internalizes standards of praiseworthiness, is also a significant motivational process, especially as the individual develops her own moral standards (Bandura, 1977).

A System's Interpretation of Bandura's Theory

We will interpret Bandura's Social Learning Theory using the same systems concepts employed above, namely wholeness and order, self-stabilization, self-reorganization, hierarchical interaction, and dialectical contradiction.

Wholeness and order. Bandura (1977) sees the environment, the organism, and its behavior as codetermining each other. From a systems perspective the person, behaviors, and environmental prompts/responses form a single system—an organized whole—with each of the components mutually influencing the others.

A cycle may begin with an infant forming a facial expression (perhaps she has gas). The grandparents observing the infant interpret the expression as a "smile" and then smile back and hug and kiss her, reinforcing the behavior, and leading to more smiling in the future.

However, it's not merely a case of the environment reinforcing behavior; the infant also influences the environment—she "smiled" first! When she gets older she will learn to smile deliberately to be cute or seductive. Having considered *wholeness and order*, let's see how the principle of *self-stabilization/development* can be found in Bandura.

Self-stabilization/development. Development is a matter of patterns activity in the system stabilizing over time. Recall that in the systems interpretation the individual is just a part of the system. It is not possible to isolate the influence of different components of the system. Bandura (1997) writes:

> Even when new responses are formed entirely on the basis of learning experiences, physiological factors serve as contributing influences. While the organization of behavioral components into new patterns results from experience, the rudimentary elements are present as part of the natural endowment. (p. 16)

Along similar lines he notes that, "complex behaviors . . . are formed through [the] integration of many constituent activities of differing origins. For this reason . . . it is [inappropriate] to categorize behaviors as learned or innate or to try to apportion relative weights to these factors" (Bandura, 1997, p. 17).

The development of speech is a good example of this. Speech is modeled in the environment, and the infant responds. But the infant is just as likely to begin babbling and the mother to respond. The child also wants to express certain things—like a desire to have a cookie—so spontaneous and modeled/reinforced behaviors, along with the volitional effort of the child, all coalesce resulting in the development of speech. Over time the child learns to express/respond to increasingly complex language and may even learn to read and write or to speak other languages. We have seen the principle of *self-stabilization/development* illustrated in the acquisition of language, now let's move onto *self-reorganization/evolution*.

Self-reorganization/evolution. Bandura (1977) does not emphasize psychological reorganization/evolution. Perhaps the closest he comes is with his concept of the *cognitive* *organization process,* whereby social inputs are symbolically organized in the mind of the learner. However, a systems interpretation in which the social environment is part of the system under analysis (refer to Figure 1 above) lends itself to interpretation in terms of *self-reorganization/evolution.* The "self" in this context is the *system.* It might be helpful to conceive of this "self/system" from a phenomenological perspective. For instance, Heidegger (1962), makes no distinction between an individual and the environment in which she lives, but rather uses the concept of "being-in-the-world."

Bandura (1986) observes that "through their actions people create [and recreate] their environments" (p. 31). Although the immediate context of this quote emphasizes continuity rather than evolution, interpreting it to support evolution does no violence to Bandura's thought. After all, he note that, "by [re]arranging environmental inducements, generating cognitive supports, and producing consequences for their own actions, people are able to exercise some measure of control over their own [evolution] (Bandura, 1986, p. 31). The selection of new environments with its concomitant reorganization of one's personal life allows an individual to, for instance, enter graduate school and evolve into a Ph.D. The next systems principle to consider is *hierarchical interaction*.

Hierarchical interaction. Human learning has a biological component, a psychological component, and a sociological component (Bandura, 1977). The psychological component has cognitive, conative, and affective subcomponents. The sociological component consists of persons in the environment (including symbolic actors in the media) modeling certain behaviors. Whether the behavior is emulated is a function of psychological processes (attention, retention and self-motivation), psychosocial processes (external and vicarious reinforcement), and biological processes (physical capabilities and motor reproduction processes) (Bandura, 1977). Bandura doesn't explicitly express the interaction of these processes as hierarchical, but such an interpretation arises naturally. We move on now to the final principle of *dialectical contradiction.*

Dialectical contradiction. Interestingly, Bandura's social learning theory considers not only the behavior and development of individuals, but also the behavior and development of groups. When writing on groups the principle of *dialectical contradiction* is apparent where he observes, "when self-determination is restricted by prejudice, those who are affected attempt to remove inequities by altering practices that compromise . . . the professed equality of values of society" (Bandura, 1977, p. 202). He is seems to be thinking of the US civil rights movement of the 1960s and in particular of Dr. Martin Luther King's *I Have a Dream* speech. This concludes my analysis of Bandura; we move now to the broader objective of this paper.

Towards a Systems Synthesis of Contextualism, Organicism, and Mechanism

In the preceding sections of this paper I have shown how the work of developmentalists in each of the major paradigms, following Goldhaber (2000), can be interpreted in terms of the general systems principles of *wholeness and order*, *self-stabilization*, *self-reorganization*, *hierarchical interaction*, and *dialectical contradiction* identified by Sameroff (1989). Having done this demonstrates that, at least in principle, the systems paradigm can subsume the contextualist, organismic, and mechanistic paradigms. The constraints of time and space (not to mention my limited expertise) prevented me from undertaking a comprehensive interpretation of all relevant scholars in each paradigm.

However, Jerry Snow (2006, private communication) has pointed out that for the systems paradigm to properly subsume the contextualist, organismic, and mechanistic, paradigms it must "transcend but include" the presuppositions of each. Granted, but it doesn't have to include *all* of their presuppositions, just the compatible ones. To facilitate the analysis, I have adapted Goldhaber's (2000) table comparing the three paradigms/worldviews (see below).

Table 3. Comparison of Pepper's Three World Views (Note. Adapted from Goldhaber, 2000)

World View	Mechanism	Organicism	Contextualism
Generalizability	Universal	Universal	Situation-specific
Types of Acceptable Causes	Efficient, material	Efficient, material, formal, final	Efficient, material, formal
Level of Analysis	Reductionist	Holistic	Holistic

Studying the table, we find that both mechanism and organicism hold with universal laws; contextualism sees each situation as unique. Let us also hold with universal laws while recognizing that their manifestation in some contexts will be situation-specific. Mechanism recognizes efficient and material causes. Contextualism recognizes these as well as formal causes. Organicism recognizes all of the above in addition to final causes. Let us recognize that each of these conceptions of causality has explanatory value. Furthermore, let us include the notion of circular causality, what Bandura would call reciprocal determinism. Finally, mechanism employs reductionist analysis, whereas organicism, and contextualism employ holistic analysis. Let us favor holistic analysis while recognizing the contribution of reductionist analysis.

Moving beyond the table, Goldhaber (2000) has related that only organicism asserts that human development has a single ideal unidirectional trajectory; mechanism and contextualism observe multiple trajectories and even the possibility of regression. Let us dispense with the simplistic notion of a single, ideal developmental trajectory and embrace the rich complexity of the phenomenon of human development.

Implications for Scholarship and Praxis

This paper has demonstrated the viability of translating the different paradigms of developmentalism into the language of systems theory, with an eye toward consilience. Of course, total consilience is an ideal that can be at best partially approximated. Nevertheless, if a broader effort were made to translate the work of developmentalists using systems concepts, scholars working in disparate paradigms might more readily comprehend and incorporate research from other developmental paradigms. Students could more easily grasp developmental theory if they didn't need to learn multiple dialects of technical jargon. Finally, consultants, coaches, and other practitioners already steeped in systems thinking, could more readily utilize research findings in their praxis.

In this paper five systems principles were used consistently within each section, but not across sections. The smallest set of consistent developmental systems principles needs to be advanced by further scholarship. If consilience is a worthwhile goal in the field of human development, perhaps others will contribute their own translations of key developmental scholarship into systems theory. Ultimately a metatheoretical integration of developmental paradigms may emerge.

Appendix

A Synopsis of Mechanism, Organicism, and Contextualism

As mentioned earlier, the terms *mechanism*, *organicism*, and *contextualism* were coined by Pepper (1970). Goldhaber (2000) made use of them in his text, *Theories of Human Development: Integrative Perspectives.* (Pepper also discussed a fourth paradigm, *formism*; however Goldhaber didn't make use of it.) Given the thrust of this paper, I have used Pepper's terms as modified and given specific content by Goldhaber. Let us begin with mechanicism.

Mechanism

Each of the worldviews Pepper (1970) analyzed has a certain root metaphor. In the case of mechanism, it is the machine. As Goldhaber (2000) observes:

> Although any machine could be used to illustrate the concept of development as a mechanistic process, two specific machines—the telephone switchboard and the computer—are… most frequently used. The telephone switch board is a simple mechanism…. When someone dials a phone number, a signal is sent to the switchboard… and the phone rings at the other end. This is essentially a process of linking stimuli with responses—and much of the research in the mechanistic tradition involves the linking of stimuli with responses. The introduction of the computer has added another dimension to the mechanistic accounts of [development]. Unlike the switchboard, which simply makes connections, the computer takes input (stimuli) and does something to it; that is, it processes information. What the computer does depends as much on the nature of the program that is processing the input as on the nature of the input itself. (Goldhaber, 2000, p. 18)

While not specifically a member of the information processing school of developmental mechanicism, Bandura's (1977, 1986) social learning and cognition theories seem to be relying on a computer-like model of human beings, albeit a highly sophisticated model. We turn next to organicism.

Organicism

The following excerpts give a sense of Goldhaber's (2000) conception of organicism.

> Pepper's root metaphor for the organismic perspective is the living organism. [The] key element of the organismic view is the process through which elements are integrated to form a *synergistic whole.* In a synergistic whole, the integrated system, unlike the machine, is more than the sum of its parts.
>
> [The] most significant difference between [organicism and mechanicism] concerns how change occurs. For mechanicists, change comes about when an external force . . . acts upon an object that is inherently at rest. For organicists, behavioral change is inherent in the living organism itself. . . . Change is therefore one of the defining characteristics of living

> organisms. . . . This distinction concerning the reason [organisms] change prompts organicists to view development as a unique form of change, . . .development is directional….
>
> Although the developmental process in organicism is directional, its outcome . . . is not preordained. [There] is no guarantee that any individual will ever reach his or her developmental end point. (Goldhaber, 2000, pp. 32-34)

For Ericson, as we saw above, that endpoint was *wisdom.* Now let's take a look at contextualism.

Contextualism

Finally, here are some excerpts from Goldhaber (2000) on *contextualism.*

> Pepper chooses the *historical act* as the root metaphor for contextualism. This choice is not meant to imply that contextualism is a world view rooted in the past but rather the meaning of any behavioral event is dependent on the context in which it occurs. (Goldhaber, 2000, p. 47)
>
> It is the character of the quality and texture of an event or historical act, as viewed by the participant, that defines his or her context. And it is the interdependence between the event and the individual, each defining and at the same time being defined by the other that is the focus for the contextualist. (Goldhaber, 2000, p. 50)
>
> One of the ways in which contextualism differs most from the other two world view concerns the issue of direction in development. [Organicists] argue that it is possible to identify a . . . sequence of developmental stages. . . . Contextualists make no such claim . . . arguing that not one but many developmental trajectories are possible. (Goldhaber, 2000, p. 53)
>
> [The] contextualist perspective on the study of human development directs our attention to the social, political, moral, and economic institutions that sustain and are supported by current assumptions about human activity. (Goldhaber, 2000, p. 55)
>
> Perhaps because of their emphasis on context, contextualists tend to be especially sensitive to the intentional and/or unintentional political and socioeconomic ramifications of developmental theories. This sensitivity is reflected in both their concern for the sociohistorical origin of the hypotheses tested by developmentalists and in their belief the proper purpose of research is in fostering equality and social justice. (Goldhaber, 2000, p. 62)

Given the dispersive character of contextualism, one should not expect any particular contextualist developmentalist to incorporate all or even most of its tenants. Sameroff's (1989) concept of *envirotype* reflects his awareness of the significance of context on development. Other contextualist notions are less prominent.

Advaita (Non-dualism) as Metatheory: A Constellation of Ontology, Epistemology, and Praxis

Latha Poonamallee[1]

Abstract: Integrating contradictory and mutually exclusive positions is a challenge in building a metatheory. In this paper, I examine how *advaita* (non-dualism) philosophy is a metatheory. Based on a holistic, non-dualistic ontology, discovery based epistemology, and personal accountability-action-reflection oriented praxis, it provides a useful metatheory for embracing, learning from, and transcending the paradoxes of social life. I use the example of Gandhi as a practitioner of this approach to action and knowledge.

Keywords: Epistemology, metatheory, ontology, paradox, praxis.

Introduction

Metatheories have continued to draw the attention of scholars in different fields (Abrams & Hogg, 2004; Carter & Jackson, 1987; Ritzer, 1988; Tsoukas, 1994). However, the discourse around nature, use and legitimacy of metatheory is a highly contested one. For example, Ritzer (1988, p. 188) while making a useful distinction between metatheory that seeks to lay down the prerequisites for doing theory, and metatheories that take developed theories as their subject matter, also bestows legitimacy on the latter approach as more useful and argues that the former approach prevents us from getting on with theorizing. Another school of thought (Abrams & Hogg, 2004; Furfey, 1965; Carter & Jackson, 1987) takes the position that examining metatheory as a constellation of ontological, epistemological, and methodological assumptions (Carter & Jackson, 1987) is a useful one.

This paper is more aligned with the latter view that an examination of the underlying assumptions about theorizing can increase “theoretical consciousness” (Ritzer, 1988) and provide an alternate framework for inquiry (Abrams & Hogg, 2004). Metatheory defines the boundaries of a phenomenon, its audience, and the level of analysis to study a particular phenomenon (Abrams & Hogg, 2004). Furthermore, each theory depends on a metatheory for its legitimacy (Carter & Jackson, 1987). If a metatheory is defined as a constellation of ontological, epistemological and methodological assumptions, one of the biggest challenges that it faces is how to integrate the conflicting and paradoxical nature of these assumptions that permeate most social science research. Van de Ven and Poole (1988) define paradox as the simultaneous presence of two mutually exclusive assumptions or statements; taken singly, each is

Figure 1. Metatheoretical Polarities in Organizational Studies

In this paper, I advance the advaita (non-dualism) philosophy as a metatheory which contains and transcends the paradox. I describe the advaitic ontology, epistemology, and praxis which together offer a metatheory. To describe this philosophy, I have drawn on the foundational work done by Dr. S. Radhakrishnan, a renowned Indian philosopher and statesman, Swami Vivekananda, a well-known nineteenth century Indian spiritual and social leader who has provided a series of translations and interpretations of major Hindu texts, and Gandhi, whose life itself was an experiment in the *advaitic* way of life (Saravanamuthu, 2006).

Advaitic Ontology

Most of the discussion about ontology in social sciences is derived from western philosophical tradition, which is imbued with a style of thinking based on dichotomy and binary opposition (Carr & Zanetti, 1999) and this has translated into a model of incommensurable paradigms. Embedded in this fundamental style of thinking, however, are not only oppositions, but also a hierarchy, in that one or the other polarity is more or less privileged (Carr & Zanetti, 1999). For example, the nature of reality can be either subjective or objective and these views are thought to be irreconcilable (Burrell & Morgan, 1979). However, a small but growing discourse of researchers has begun to address alternative conceptions (Alvesson & Skodberg, 2001; Benefiel, 2005; Bhaskar, 1970; Saravanamuthu, 2006; Tsoukas, 1994; Willmott, 1990). However, these attempts still remain marginal in our field and problematize research endeavors that aim to bridge this conceptual gap. I join this discourse by offering an alternative paradigm that has the capacity to embrace the paradox without having to resolve it through allegiance to one or other position.

Advaita philosophy rests on assumptions of non-dualism. The Advaitic's fundamental tenet is that that all forms of matters are interconnected by an all pervasive energy (Saravanamuthu, 2006). The central texts of this school are Samkara's commentaries on the principal Upanishads, the Bhagavadgita and the Vedanta Sutra. This philosophy can be summed up in a single dictum, *"Tatsvam Asi,"* meaning "You are that," ***that*** meaning the other. Another gem of this philosophy is "*Aham Brahman,"* "I am *Brahman,"* and therefore, it is not separate from me. Vivekananda (1992a, p. 359) writes, "All matter throughout the universe is the outcome of one primal matter called Akasha; and all force, whether gravitational, attraction or repulsion, or life, is the outcome of one primal force called Prana."

This approach does not separate the spiritual from the mundane because they are all parts of the same ultimate reality. Radhakrishan (2000, p. 32) writes, "It is the soul's experience of the essential unity with the whole of being that is brought out in the words, "Thou in me and I in thee."

This philosophy is concerned with understanding human existence as an integral part of a larger and interconnected whole (Saravanamuthu, 2006). This is a socio-ecological relational approach to reality – one that does not separate nature from other living creatures (Poonamallee, in press). All sentient beings are interrelated and part of the same ultimate reality. Sarvanamuthu (2006) writes about advaitic philosophy as an appropriate model for sustainable development. It is predicated on the relationship that binds, people, animals, vegetation, and all forms of matter together and the personal responsibility of human beings to honor this relationship through *Ahimsa* (non-violence). Ahimsa was the concept Gandhi drew from Advaita philosophy to develop and deploy his non-violence strategies, which is addressed in more detail in a later section.

For the *advaitis*, the objective world exists. It is not an illusion. There are different orders of reality, Brahman being the Ultimate Reality and therefore the mental world or the world of consciousness is as much objective or unreal as the material. Vivekananda (1992b) writes,

> Maya is not a theory for the explanation of the world: it is simply a statement of facts as they exist, that the very basis of our being is contradiction, that everywhere we have to move through this tremendous contradiction that wherever there is good, there must also evil. (p. 60)

The Ultimate is beyond paradoxes because it contains all the paradoxes. It is at once *nirguna* (devoid of qualities), *saguna* (possessing qualities) and is unconditioned and yet conditioned, determinate and non-determinate. In this framework, objective and existential realities are not to be set against each other as metaphysical contraries (Radhakrishnan, 2000). Nor do they finally diverge. In fact, in his exposition on the theory of *maya* (illusion), Sankara, one of the key exponents of the non-dualistic advaitic philosophy categorically lays out that the objective world or the empirical being *(vyavaharika satta*) is quite different from illusory experience (*pratibhasika satta*) and both co-exist. Advaita is cognizant of the contradiction between materialism and spiritual development and it asserts that spiritual-moral development is unlikely to occur until fundamental needs are satisfied (Saravanamuthu, 2006). However, both objective and subject realities are manifestations of the ultimate reality but are not of the same kind or order. Both subjective and objective realities are valid expressions of the Ultimate. But they are different kinds of reality and one cannot be reduced to the other.

Advaitic Epistemology

Ontological assumptions undergird epistemological positions about whether the nature of knowledge is hard, real and capable of being transmitted in a tangible form, or whether "knowledge" is a softer, more subjective, spiritual, or even transcendental kind, based on experience and insight of unique and essentially personal nature. The fundamental tenet of advaitic epistemology is *satchitananda* (Existence-Knowledge-Realization/Bliss). It is the process of experiential transformation (Gandhi, 1935) and is inseparable from developing greater sensitivity to the spiritual interconnectedness with the other (Saravanamuthu, 2006). *Advaita* is governed by non-cognition of duality (*davaitasyagrahanam*) because the ultimate reality is non-dual and the world of duality is the world of *maya* (Radhakrishnan, 2000). Freedom is the realization of the Brahman in the individual soul. Unchangeable reality expresses itself in the changing universe without forfeiting its nature. In the *Vedantaparibhasa,* it is said that all knowledge whether perceptual or conceptual, attempts to reveal reality or the ultimate spirit: "*pratyakasaparma catra caitanyam eva"* To know or to realize this is the ultimate goal of an *advait*i. In this state, *vidya* (knowledge) and *ananda* (bliss) come together.

In the advaitic non-dualistic approach, knowledge is not just limited to codified, objectified knowledge but integrates multiple ways of knowing, action, experience, contemplation, and sense-making, all through witnessing of the self, because self is a microcosm of the universe. The assumption here is that everyone has the capacity to witness both empirical realities and subjective experiences and ultimately be free of both of them through knowing. All human development is about moving *adhyasa* (mistaken notions) and *avidya (*non-knowledge) to *vidya* (knowledge). *Advaita* values *anubhava* (experience) because the goal of *advaiti* is to discover the immanent principle within experience and not in a world beyond it. For example, Vivekananda (1992) characterizes experience as a key source of knowledge. In fact, God, in this framework can be considered a metaphor for the dynamics of the unknown: it refers to the workings of an interconnected ecosphere that creates, sustains and destroys in the process of regenerating life (Saravanamuthu, 2006b).

Critical inquiry is considered to be an essential path to examine that which is supplied to us by scripture or the evidence of the senses. Three sources of knowledge are perception, inference, and scriptural testimony. However, memory or tradition is not considered right knowledge because it has no novelty. Nature (*swabhava)* is the underlying object of a subject – the underlying principle of things. We need one to experience and understand the other. While realization of nature (object) of a phenomenon (subject) is a fact, a theory of reality is an inference (Radhakrishnan, 2000). While perception is the fruit of experience, inference is the fruit of analysis and sense-making through the intellect (Buddhi). Based on one's stance, the internal processing organ could be *manas* (feelings), *chitta* (concentration), *buddhi* (thinking), or *ahamakara* (consciousnessness). This philosophy also distinguishes between *paravidya* (higher knowledge) pertaining to the ultimate reality and the *apara vidya* (lower knowledge) pertaining to the subjective and objective realities. However, in the state of *Caitanyam* (pure awareness) there is no differentiation between the knower and the known – ultimately the result of the interaction between the subject and the object.

Law of Karma (Cause and Effect) is a key element of *advaitic* philosophy. This law asserts that every action has a consequence (Saravanamuthu, 2006a) and demands personal accountability. For example, Gandhi (2001) writes about the means and ends using this theory, "They say, "means are after all means." I would say, "means are after all everything." As the means so the end. There is no wall of separation between the means is the end" (p. 65).

While deeply anchored in the law of karma, this philosophy paradoxically also recognizes that causal explanation can never be complete. Every finite thing presents the contradiction that it is not only finite but also relative in sense that it hangs on another (Radhakrishnan, 2000). Such is the nature of an interrelated universe. Therefore, truth is constantly discovered through a personal process of discovery. As Krishnamurthy (1969) writes, "Truth has no path, and that is the beauty of truth, it is a living concept."

Advaitic Praxis

Advaitic knowledge is a lived reality – knowledge through praxis. Advaitic praxis is all about the interplay between the contradictions that naturally co-exist in every person (Vivekananda, 1992). He writes,

> We must do our part, because that is the only way of getting out of this life of contradiction. Both the forces of good and evil will keep the universe alive for us, until we awake from our dreams and give up this building of mudpies. That lesson we shall have to learn, and it will take a long, long time to learn it. (p. 63)

Saravanamuthu (2006a) writes that Gandhi's concept of Swaraj (Home Rule) refers both freedom from internal contradictions as well as structural ones. Ramakrishna, Swami Vivekananda's mentor writes,

> Man is born with two tendencies, Vidya guna and Avidya guna – the noble and the base – dormant in him. The former leads him Godward and the latter makes him earth-bound. In babyhood both the tendencies are in equilibrium . . . if he grows in the life in senses, the scale of worldliness goes down with that base weight . . . but if he emerges in spirituality, the scale in him of Godliness goes down toward Iswara (the whole) with that holy weight. (Chidhbhavananda, 1991, p. 650)

However, this type of praxis is not merely about ritualistic religious practice. It is about accepting personal accountability for spiritual development. For example, Gandhi, a man full of godliness writes, "I recognize no God except the God that is found in the hearts of the dumb millions . . . and I worship the God that is Truth or Truth which is God through the service of these millions" (Gandhi, quoted in Tendulkar, 1960, p.58).

Advaita offers four avenues for spiritual development through praxis. They are: Jnana yoga or the knowledge path (Vivekananda, 1992), Raja or mastery of inner spirit (Vivekananda, 1990), Karma or service to other (Vivekananda, 1984), and Bhakti yoga or worship (Vivekananda, 1991). The term yoga refers to the means of transcending private interests. "Yoga means the process, as well as the result, of balancing the different sides of our nature, body, mind, and spirit, the objective, and the subjective, the individual and the social, the finite and the infinite" (Radhakrishnan, 2003, p. 36). What is important to note here is that out of the four approaches, only one takes the religious route. Gandhi is considered to be one of the exemplars of advaitic practitioners in modern times and one who attained mastery of most of these forms of spiritual development, especially Raja and Karma Yoga (Sarvanamuthu, 2006b). His entire life was an experiment with truth and knowledge (Gandhi, 1993) through action and reflection.

Advaitic philosophy values the intellectual, ethical, emotional, and spiritual dimensions of life. It describes the fourfold object of life (*Purusartha*). They are desire and enjoyment (*kama*), interest and wealth (*artha*), ethical living (*dharma*), and spiritual freedom (*moksa*). Kama caters to the emotional and instinctual needs of human life. *Artha* caters to the material, *Dharma* to the intellectual, and *moksa* the spiritual. Advaitic praxis is all about the struggle to know. However, without the action of knowing, knowing is not possible.

For this knowing process, reflexivity that emanates from spiritual consciousness is an important element. For example, Gandhi's reflexive-spiritual development manifests as his refusal to adhere to imperialist norms and values (Saravanamuthu (2006a). It is an ethic of personal responsibility for action combined with reflexivity. For example, Gandhi (1984, p. 67) himself writes, "Non-violence in its dynamic condition means conscious suffering. It does not mean meek submission to the will of the evildoer, but it means the putting of one's whole self against the will of the tyrant."

Operating on the non-dualistic spiritual interconnectedness ontology demands personal responsibility for the other, and in the process transforming oneself and transforming the society. Parameshwar (2006) writes about how eleven renowned social leaders (including Gandhi) drew on their own suffering to transform the world for the multitudes. Gandhi's strategy for practicing this was the *Satyagraha* (active fight for truth). *Satyagraha* is not passive resistance. Gandhi (1993) himself clarifies that passive resistance is not really resistance but a policy of communal suffering. On the contrary, *satyagraha* is about centralizing discipline for engendering change by bringing together the oppressed and oppressors in action, reflection, and dialogue (Sarvanamuthu, 2006).

Discussion

In this section, I use Ritzer's (1988) exposition on metatheory to discuss how advaita can be a metatheory and its implications for research. The first one is to increase the "theoretical self-consciousness" because greater self-consciousness can lead to greater understanding of one's own theory as well as of competing theories (Ritzer, 1988, p. 195). Advaita philosophy serves this function by providing a comprehensive constellation of ontology, epistemology and praxis and can be used to examine a theory developed using this methodology. In this paper, I have described how the philosophy of non-dualism can be a metatheory encompassing the paradoxes of social life. Ritzer (1988) also highlights that the objective-subjective continuum needs more exploration. Advaita philosophy as a metatheory throws new light on this topic. The holistic ontology which contains both the subjective and objective realities provides a socio-ecological relational framework for the interconnectedness of all matter in the world. Because of its holism, it can accept the subjective and objective realities without having to privilege one over the other. This has epistemological implications for how we study human organizations.

Knowledge according to advaita philosophy is a personal search for the truth and integrates multiple ways and sources of knowing. It includes the sensory perception of a subjective actor, intellectual detachment of reason and logic, all nested within a spiritual consciousness cognizant of the spiritual interconnectedness. This knowledge values both ideal and material realities. Conventional dualistic approach that guides most research today operates under the assumption that material and ideal realities are irreconcilable and a researcher has to pick one or the other as the ultimate truth. Ideal or subjective reality contains entities like consciousness, discursive acts like conversations, stories, and metaphors. Entities that belong to the material realm are hard and tangible. In the model proposed by Burrell and Morgan (1979), interpretive and radical humanist paradigms operate under the assumption of subjective ontology. The functionalist and radical structuralist approaches belong to the objective ontology. However, advaitic holistic ontology allows co-existence of both subjective and objective realities because both of them are expressions of the ultimate reality of oneness. They exist simultaneously and influence each other. To an advaitic practitioner, both material and ideal realities exist and both are manifestations of the ultimate reality. To the uninitiated, these two positions may seem contrary but the advaiti acknowledges the contradiction and embraces it.

For example, Vivekananda (1893a), in his address to the Parliament of Religions, said, “It is bread that the suffering millions of burning India cry out for with parched throats…It is an insult to starving people to offer them religion. It is an insult to a starving man to teach him metaphysics.”

In the same speech (Vivekananda, 1893b) he also said,

> Here I stand and if I shut my eyes, and try to conceive my existence, “I,” “I,” “I,” what is the idea before me? The idea of a body. Am I, then, nothing but a combination of material substances? The Vedas declare, “No.” I am a spirit living in a body. I am not the body. The body will die, but I shall not die. Here am I in this body; it will fall, but I shall go on living. I had also a past. The soul was not created, for creation means a combination which means a certain future dissolution. If then the soul was created, it must die.

Similarly, much of Gandhi’s practical philosophy focused on economic self-reliance for the rural poor of India. The chakra (low-tech spinning wheel) became a symbol of a movement. At the same time, Gandhi galvanized the millions of oppressed Indians and inspired the oppressors through his spiritual, moral and political strategies. He uses the term “god” in a reformist sense (Saravanamuthu, 2006). Gandhi (1995, 9-10) writes,

> To me God is Truth and Love; God is ethics and morality; God is fearlessness. God is the source of Light and Life and yet He is above all of these. God is conscience. He is even the atheism of the atheist. He is the searcher of hearts. He transcends speech and reasons. He knows us and our hearts better than we do ourselves (pp. 9-10).

The second area that metatheory can contribute to is the linkage between cognitive and communal aspects of a paradigm (Ritzer, 1988). Advaita philosophy is based on the assumption that it can transcend the communal dimensions. Gandhi as an advaitic practitioner has influenced multiple other communities and their transformation. Saravanamuthu (2006) argues that Gandhian-Vedic approach has universal relevance. The history of civil rights movement in the U.S (led by Martin Luther King), anti-apartheid movement in South Africa (led by Nelson Mandela) and a multitude of communal experiments toward social transformation show that these principles are transferable to other cultural contexts outside of India.

The third line of inquiry that Ritzer (1988) raises is the development, refinement, expansion, and application of metatheoretical tools like levels of analysis and micro-macro linkage. Advaita as a metatheory, especially its focus on praxis of dealing with personal and social contradictions offers a new way to look at the micro-macro linkage. Saravanamuthu (2006) provides an excellent example of the micro-macro linkage using Gandhi’s advaitic practice. She writes that Gandhian-Vedic notion of freedom refers to emancipation from the circular dialectic of social contradictions, which arises when an individual engages with the structure. She cites Gandhi’s life as an example of how structural contradictions and personal contradictions get engaged in the deepest way possible through spiritual development and service, thus resulting transformation of self and society.

Finally, this metatheory has the potential to shape and offer new tools for researchers in the action-research arena. In another paper, I have provided an example of how I developed a particular theory in an action-research context, grounded in the advaitic paradigm (Poonamallee, 2009). Advaita philosophy encourages reason, logic, and reflection. Traditions like phenomenology and action research offer frameworks for such self-reflexive process too. Marshall (2001) offers a useful model of “inquiring through inner and outer arcs of attention.” Advaitic epistemology is based on the belief that a subject can view itself as an object. Recent cognition and consciousness researchers advance a similar argument. Grush (2000) writes that a first person perspective allows a system to conceive of itself as part of an independent, objective order, while at the same time being anchored in it and act as a subject. The conventional subjective-objective polarized notion of ontology denies a subject the capacity for objective reflection. From this point of view, most qualitative and especially naturalistic inquiry appears to be subject to subjectivity simply owing to its stance on a researcher’s phenomenological presence. Advaitic philosophy and Gandhi’s extensive reflection on his own spiritual development and struggle of wrestling with the personal and social contradictions offer promise.

Conclusion

In this paper, I have presented the tenets of advaita philosophy and practice and have argued that this framework fits the requirements to be a metatheory. I have described the ontological, epistemological and practical implications of advaitic philosophy. Advaita ontology is predicated upon the belief that all life in the universe is interconnected and hence life is non-dualistic. Advaita epistemology is about experientially discovering this truth of interconnectedness through praxis. Finally, I have presented the contributions that this framework can offer to theory building in general.

However, there are three challenges in adopting advaita as metatheory. The first one is that assumptions underlying this approach are very alien to the mainstream western philosophies of science that still legitimize or delegitimize new ideas and discoveries. Further systematic research needs to be undertaken to find boundary objects, ideas, and practices that can help in communicating this seemingly esoteric but very practical framework to the mainstream scholars. The second challenge is that because advaitic philosophy privileges ontological complexity, paradox and multiple ways of knowing, it is not amenable to the more commonly understood notions of parsimony in theory building. New and deliberate methodological innovations need to be made to integrate and represent the complexities inherent in this approach. Finally, unlike most mainstream approaches to research, advaitic philosophy offers no off-the-shelf prescriptions. While there are general guidelines, there is no formulaic answer to research problems. Therefore, a scholar who wishes to adopt advaitic philosophy as metatheory needs also be willing to undertake a personal journey of truth through advaitic praxis. However, all these challenges are paradoxically rich and fertile grounds for further research.

Evolutionary Psychology, Developmental Systems Theory and Advaita Philosophy as Metatheories: Are the Three Compatible?

Annemie Ploeger[1]

In this special issue different metatheories are proposed, including evolutionary psychology (Ploeger, 2010), developmental systems theory (Antley, 2010), and advaita philosophy (Poonamallee, 2010). Evolutionary psychology is psychology that is informed by theory and research of evolutionary biology, with the idea that knowledge about the evolutionary background of psychological phenomena will contribute to the understanding of these phenomena (Cosmides, Tooby, & Barkow, 1992). Systems theory can be defined as a holistic theory about complex systems in nature. When applied to development, this theory is often called dynamic systems theory,[2] which states that developmental outcomes are the result of the spontaneous emergence of higher-order forms, which are the result of interactions among lower-level components. This process is called self-organization (Lewis, 2000). Advaita philosophy is another holistic theory that presumes non-dualism, i.e., the reality of an individual is identical to that of the world and cosmos. The basic tenet is that all forms of matter are interconnected by an all pervasive energy. Human existence can be placed in an integrated, interconnected whole (Saravanamuthu, 2006).

Different questions can be addressed concerning these three metatheories. One question concerns the correctness of these metatheories: is one of these metatheories the correct one, or is it possible to have different co-existing metatheories, addressing different areas of inquiry? Is it desirable to have one ultimate metatheory, or would this metatheory be too general to be of practical value for the daily work for scientists? Another question that can be raised is whether the different metatheories have the same purpose: is it a metatheory that provides a framework for creating new theories and evaluating existing theories (e.g., advaita philosophy), or is it a metatheory that unifies different subdisciplines (e.g., developmental systems theory, evolutionary psychology)? Another question is whether it is possible to integrate these different metatheories into one overarching view. Are there similarities or are these metatheories in opposite of each other? In this essay, this last question will be addressed.

---

[1] **Annemie Ploeger** (1973) received her PhD degree at the University of Amsterdam in 2008. Chapters of her thesis Towards an Integration of Evolutionary Psychology and Developmental Science: New Insights from Evolutionary Developmental Biology, were published in Psychological Inquiry, Psychiatry Research, and Biological Psychiatry. After being a visiting scholar at the University of California, Los Angeles, she now works as an assistant professor in Developmental Psychology at the University of Amsterdam.

[2] In this essay, I will use the terms *developmental systems theory* and *dynamic systems theory* interchangeably

SOME RIGHTS RESERVED

On a first view, these three proposed metatheories appear to be very different from each other. Evolutionary psychology is based on theories and empirical findings in evolutionary theory, and focuses on phylogeny (changes over generations), rather than ontogeny (changes in an individual lifetime). Developmental systems theory, on the other hand, has its main focus on ontogeny. Advaita philosophy is based on Hindu spiritualism and has not been embraced by many Western researchers yet. So on the first sight these three different metatheories seem hard to be reconciled. However, some recent debates in the literature have shown that we need to embrace and reconcile different perspectives in order to reach progress in science. Particularly, there have been debates on the value of evolutionary psychology, and the relation between evolutionary thinking and developmental science (Lickliter & Honeycutt, 2003a; Spencer et al., 2009). In this essay I will briefly summarize this debate, and I will elaborate on the role that advaita philosophy may play in this debate.

Evolutionary Psychology and Developmental Systems Theory

Evolutionary psychologists have proposed that we possess many different evolved psychological mechanisms to deal with problems related to survival or reproduction (e.g., Buss, 1995; Tooby & Cosmides, 1992). An example is our ability to rapidly learn a fear of snakes, an evolutionary significant stimulus related to survival, opposed to our inability to learn a fear of flowers, or even a fear of guns or cars (stimuli irrelevant from an evolutionary point of few; these stimuli are either not dangerous or were non-existent in our evolutionary past).

This view on evolved psychological mechanisms has been questioned by developmental system theorists (Lickliter & Honeycutt, 2003a). These theorists argued that evolutionary psychologists focus too much on evolved mechanisms, and that evolutionary psychologists ignore the role of development in the unfolding of behavior and cognition. According to Lickliter and Honeycutt, evolutionary psychologists implicitly assume that these evolved mechanisms are preprogrammed in the genes, and that phenotypic traits are prespecified. They state that:

> what offspring inherit from parents is not simply genes, but a structured developmental system. This developmental system provides sources of both stability and variability, and the structure and interactions among components of an organism's developmental system are as causally informative to the development and transmission of phenotypic traits as are the strands of DNA contained within this system. (p. 828)

Because Lickliter and Honeycutt (2003a) wrote their proposal as a frontal attack of evolutionary psychology, it was understandably not well-received by evolutionary psychologists (Buss & Reeve, 2003; Tooby, Cosmides, & Barrett, 2003). Buss and Reeve called developmental or dynamic systems theory obscure and vague, and in a recent paper they claimed that theories that invoke self-organization or dynamical systems have not led to a single new specific prediction or empirical finding (Duntley & Buss, 2008). In an earlier book, evolutionary psychologist Pinker (1997) wrote that:

> any explanation of how the mind works that alludes hopefully to some single master force or mind-bestowing elixir like 'culture,' 'learning,' or 'self-organization' begins to sound

> hollow, just not up to the demands of the pitiless universe we negotiate so successfully. (p. 19)

In short, there is great disagreement between evolutionary psychologists and developmental theorists on the issue of evolved psychological mechanisms, and how much impact individual development has on the unfolding of phenotypic traits. In my point of view, there are three ways that open up the debate in a more fruitful way.

First, some evolutionary psychologists have embraced dynamic systems theory and try to incorporate the principles derived from this theory in their work (Kenrick, 2001; Kenrick, Li, & Butner, 2003; van Vugt, 2009). Kenrick (2001) argued that the two frameworks of evolutionary psychology and dynamic systems theory may in tandem provide the foundation for psychology's long-awaited metatheory. He illustrated his proposal with research that is relevant for evolutionary psychology: how does a community of people decide to adopt an aggressive or a peaceful strategy to deal with a particular problem? Initially random interactions between individual members of the community, with compounding reciprocal effects on one another, finally result in stabilizing patterns. These self-organized patterns emerge in all kinds of networks, including those involved in genes, neurons, and groups of people.

Second, some developmental psychologists have tried to develop a new framework that incorporates both ideas from evolutionary psychology and developmental systems theory (Bjorklund, Ellis, & Rosenberg, 2007). These researchers argued that evolved psychological mechanisms could be perceived as evolved *probabilistic* mechanisms: mechanisms that have been naturally selected, but that are still plastic and their outcomes can be adjusted to environmental input. For example, children with a genetic predisposition to become aggressive and antisocial, will only develop this way when raised in harsh environments. When raised in a normal environment, they will not become aggressive and antisocial (Belsky et al., 2009; Caspi et al., 2002).

Third, I have argued that evolutionary psychology needs to embrace the framework of evolutionary developmental biology in order to broaden its scope (Ploeger, van der Maas, & Raijmakers, 2008). I included dynamic systems theory in this framework. Dynamic systems theory, with its major concept of self-organization, can be applied to individual development, but also to evolutionary processes. Self-organization is not a vague or hollow concept, as evolutionary psychologists Duntley and Buss (2008) and Pinker (1997) have argued. There is a large body of literature in evolutionary biology on the role of self-organization in evolution (e.g., Camazine et al., 2001; Pulselli, Simoncini, & Tiezzi, 2009; Solé & Goodwin, 2000). For example, according to Kauffman (1993), self-organization is a necessary concept in any theory that tries to explain order in nature. On the other hand, I do not believe that dynamic systems theory should replace evolutionary psychology, as some authors seem to suggest (Lickliter & Honeycutt, 2003a). As Buss and Reeve (2003) have stressed, evolutionary psychologists have made quite a long list of discoveries that would not have been revealed without an evolutionary framework. These discoveries are important scientific contributions. True progress will be made only if the two approaches start working together.

Evolutionary Psychology, Developmental Systems Theory and Advaita Philosophy

The connections and disagreements between evolutionary psychologists and developmental systems theorists have become apparent in the literature. The connections between these two approaches and advaita philosophy are less clear. By searching *Web of Science* on "advaita and evolution," or "advaita and development," not much literature can be found. So we need to develop a completely new scientific framework to integrate these different views. Let me elaborate on two parallels between evolutionary theory and advaita philosophy, and another parallel between developmental systems theory and advaita philosophy. By considering these parallels, we may be able to integrate these different metatheories, or at least formulate some similarities that serve a common ground.

To start with the parallel between evolutionary theory and advaita philosophy; advaita philosophy tries to understand human existence as an integral part of a larger and interconnected whole. This idea can be compared to the Darwinian idea that the human species is connected with all other species in a tree of life - all species on earth share a common ancestor, a prokaryote that arose around 3.5 billion years ago. This prokaryote arose in some way from the interaction of molecules that were available at that time, so in this way all species including human beings are connected to the world and the cosmos. Whether this connectedness is the same as the all pervasive energy as proposed by advaita philosophy, is an open question.

Another parallel between evolutionary psychology and advaita philosophy is that they call for unification. Advaita philosophy calls for the unification of the self and the rest of the world and the cosmos; evolutionary psychology calls for a unification of different fields in psychology or science in general. These seem to be quite different calls, but it can be seen as a parallel between the way individuals behave in relation to the world, and the way individual scientists behave in relation to the scientific world. Both metatheories call for an opening of the mind, to stop focusing on one's own small world and see the connectedness with other parts of the world.

A parallel between developmental systems theory and advaita philosophy is their focus on holism. The advaita philosophy stresses a non-dualistic view: the division between the self and the world is an illusion; both are part of a larger "system," to borrow a metaphor from developmental systems theory. The objective and the subjective come together when we realize that there is no boundary between the self and the rest of the world. Developmental systems theorists have proposed that:

> development is a self-organizing, probabilistic process in which pattern and order emerge and change as a result of transactions among developmentally relevant resources both internal and external to the organism (and not from some set of prespecified instructions). Development is not the result of the interaction of genetic and environmental factors, as neither operate as independent causes; rather, development results from bi-directional and dynamic transaction of genes, cells, tissues, organs, and organisms during the course of individual ontogeny. (Lickliter & Honeycutt, 2003b, p. 869)

Thus, developmental systems theorists view development as a holistic process that involves different components at different levels. This view can be seen as non-dualistic: there is no clear division between genes on the one hand, and the rest of the developmental system on the other hand. In this way we can draw a parallel between developmental systems theory and advaitic philosophy.

Obviously it will be very hard to integrate the three different metatheories of evolutionary psychology, developmental systems theory, and advaita philosophy. Advaita philosophy is a metatheory that provides a framework for creating new theories and evaluating existing theories, whereas evolutionary psychology and developmental systems theory are metatheories that unify different subdisciplines. However, in this essay it was argued that there are some common grounds, that may lead to an overarching view that unites the different proposals.

Special Issue Introduction

Issue Editor: Bahman A.K. Shirazi

Integral Education

The essays appearing in this special issue of *Integral Review* are selections from the proceedings of the 2010 California Institute of Integral Studies (CIIS) Founders Symposium on Integral Consciousness. This annual symposium provides a forum for CIIS community members and friends to exchange and deepen their understanding of integral consciousness, its evolution, and its relationship to the current planetary challenges and transformational processes. Each year the Symposium covers one or two major themes, as well as several other themes pertinent to the integral world view and its interface with academic disciplines. One of the major themes of 2010 was integral education.

Contributions to this issue are by a cross-section of CIIS community members including administrative leaders: President Joseph Subbiondo and Academic Vice President, Judie Wexler; three faculty members: Matthew Bronson, Ian Grand, and Kaisa Puhhaka; two alumni: Anne Adams and Christian de Quincey; and two current students: Maureen Dolan and Adrian Villasenor-Gallarza. There is also an essay by Lynda Lester, an active practitioner of integral yoga who was a guest presenter. The topics range the full gamut from integral philosophy, ontology, epistemology, methodology to pedagogy.

The editor’s introductory article gives a summary of the founding vision, as well as ontological and epistemological principles of the integral framework expounded by Haridas Chaudhuri, founder of CIIS and his key collaborators.

Joseph Subbiondo gives a brief account of the history of CIIS and its predecessor institution, the American Academy of Asian Studies, focusing on several key founding figures of both institutions. He argues that the role played by these unique institutions of higher learning has been crucial in the cultural life of San Francisco Bay Area, and now continues to promote an integral, whole-person approach to higher education.

Judie Wexler, who has lead and facilitated the faculty discussions on integral education at CIIS in the last nine years, explores the concept of integral education as a way to prepare students for the complex, rapidly changing global environment in which they will be living and working. She contends that education must help students focus both internally and externally if they are to be effectively prepared. The experience of CIIS is used as a case study to discuss key dimensions of integral education.

Matthew Bronson showcases an integral approach to education through the lens of a trans-disciplinary graduate-level class on “Sexuality and Language.” The class brought together students from six separate academic programs and drew from a wide array of performative and

SOME RIGHTS RESERVED

arts-based modes of inquiry to create a deep context through which to unpack the complex relationships between language and sexuality.

Ian Grand draws on some key principles of integral philosophy, embodied spirituality, and transformative action in the world, to make a case for a creative emergence in this historical time of new possibilities of being and becoming. He stresses that the conditions, practices and tools of the historical era in which we live shape us as we shape them and writes that what becomes important in practice is to learn tools and perspectives that expand our ability to participate in the making of the world.

Kaisa Puhakka explores the tension between two movements in human evolution—shifting and settling—where shifting breaks out of existing structures and conceptual moorings and settling solidifies the movement of evolution into structures. Both are seen as essential aspects of the evolutionary process, but a bias for settling is noted among living creatures. She argues that for humans shifting arouses anxiety whereas settling promises security. She calls for a correction of this bias in the educational process to help realign human consciousness and culture with the rest of nature and cosmos.

Maureen Dolan examines some of the main topics in the works of Sri Aurobindo and Haridas Chaudhuri regarding the philosophical bases for an integral understanding. She describes concrete ways to introduce the integral paradigm into practice in the U.S. through an example of a particular undergraduate course she teaches at DePaul University in Chicago titled: *Body, Mind, Spirit: Yoga and Meditation.* Her introduction includes a brief description of the cultural milieu of 21st century American realities, identifying some of the conditions which can serve as impetuses to integral thought and action.

Anne Adams explores the critical role education plays in the attitudes and behaviors in our everyday experiences and introduces Integral education as a catalyst for transformation, moving our emphasis in education from gathering knowledge to growing consciousness through a paradigm shift which would fundamentally alter where our attention is focused—from having and doing to being.

Adrian Villasenor-Galarza addresses the need to incorporate often ignored perspectives and formulations derived from the “deep south” into the field of integral education as currently practiced at CIIS. The deep south—the metaphorical conglomerate of wisdom ascribed to the global south and associated epistemologies—is used as a broad framework from which he proposes, through the exploration of shamanic practices and symbols, the creation of an organizing vertical metaphor, a North–South axis of dialogue.

Christian de Quincey argues that the details of evolution or the structures of the brain are irrelevant to the study of consciousness. He maintains that science informs us only about the physical world whereas consciousness is non-physical and, therefore, there are no ontological leaps possible. He explores how we may account for the fact that consciousness exists in an otherwise physical universe.

Lynda Lester believes that the chasm between spirit and matter is bridgeable as predictable by Sri Aurobindo’s integral philosophy, which states that the entire universe is a manifestation of consciousness. She argues that science has changed our view of matter as solid and objective, to a view that is more complex and which includes the possibility that consciousness has a part in manifesting reality. She makes a case that some of Mother Mirra Alfassa’s experiences in bringing supramental consciousness into her body bear similarities to the discoveries of quantum physics.

These writings provide an opportunity for the reader to become familiar with an example of how integral philosophy, epistemology, and pedagogy are currently understood and practiced at a pioneering institution of higher learning that aims to embody and practice a holistic world view in its overall approach to education. Despite the clarity of the founding vision, the actual processes of articulation and praxis of a whole-person approach to education are still in their infancy and are a perpetual experimental work-in-progress.

In the integral view, human beings are considered to be transitional beings and not a final product of evolution. It is hoped that this continual process of reflection on learning and praxis will facilitate the goal of educating and integrating the total person: attainment of wholeness of individual personality, and the collective fulfillment of human purpose on Earth.

Integral Education: Founding Vision and Principles

Bahman A.K. Shirazi[1]

Abstract: This introductory article gives a brief account of the founding vision and ontological and epistemological principles of the integral framework expounded by Haridas Chaudhuri and some of his original collaborators at the California Institute of Integral Studies (CIIS). A brief biographical account of Sri Aurobindo and Mother Mirra Alfassa, originators of integral yoga and education, is provided and some of the principle tenets of an integral worldview that informs the philosophy of integral education are discussed.

Keywords: Haridas Chaudhuri, integral education, integral philosophy, integral worldview, Mother Mirra Alfassa, Sri Aurobindo.

Introduction

The dawn of the 21st century may be regarded as a crucial turning point in the history of the evolution of consciousness on our planet Earth—the beginning of profound transformations of consciousness marked by a significant leap from a predominantly mind-centered consciousness, to an emerging all-inclusive, spirit-centered integral consciousness.

Jean Gebser was one of few western visionary philosophers who had anticipated the arrival of this new modality of consciousness. Before him, others such as Pierre Teilhard de Chardin and Rudolph Steiner also offered world views that indicated that a certain convergence and a culmination point in the long history of terrestrial evolution could be anticipated. Moreover, beginning in the latter part of the 19th century, eastern movements such as the Ramakrishna-Vivekananda movement, Meher Baba's work, and the eastern-inspired theosophical movement were also exploring and preparing the grounds for the arrival of this new era. The most explicit and pragmatic work in the adventures and the advent of integral consciousness, however, may be credited to the works Sri Aurobindo and Mother Mirra Alfassa, the originators of integral yoga.

Sri Aurobindo (Aurobindo Ghose, 1872-1950) was India's foremost philosopher, poet, and spiritual figure of the 20th century. At age seven he was sent to England where he mastered Western classical literature and languages. He returned to India at age twenty-one and soon mastered classical Indian literature and languages as well. He was active in the Indian independence movement until 1910 when he moved to Pondicherry to pursue his spiritual work. From 1910 to 1950 his spiritual practice focused on the reconciliation of the spiritual and

material realities with the ultimate goal of utilizing the most powerful spiritual forces to accelerate and transform human evolution. He recognized that the current human state of consciousness is merely a transitional state with endless potential for spiritual development and called for the integration of Eastern and Western cultural and knowledge traditions.

Sri Aurobindo rejected the notion of illusoriness of the phenomenal world and recognized spiritual and material realities as equally real dimensions of a whole and indivisible spectrum of reality. He reconciled several major schools of Vedanta with the essential teachings of the Tantric approach, thus synthesizing a comprehensive approach known as Integral Yoga, emphasizing a balanced approach to spiritual development with equal emphasis on knowledge/wisdom, love/compassion and action.

He stressed the purposefulness of human life on earth as embodiment of spirit and taught that human suffering stems from ignorance and unconsciousness due to disharmony between physical, emotional, mental and spiritual dimensions. He rejected the world-negating as well as individualistic approaches to spiritual development as escapism and embraced embodied spirituality and the reintegration of the feminine Divine. (Shirazi, 2009a)

The Mother (Mirra Alfassa, 1878-1973) was an extraordinary mystic and spiritual leader, and was Sri Aurobindo’s spiritual collaborator. As a child she had a series of spiritual experiences leading to her realization of the Divine. She was also an accomplished artist, musician, and writer. In 1914 she met Sri Aurobindo and six years later joined him in Pondicherry where she stayed for the rest of her life to collaborate with him in his spiritual mission aimed at complete transformation of human consciousness.

The Mother oversaw the daily activities of the Sri Aurobindo Ashram, founded the International Centre of Education, and in 1973 founded Auroville, an experimental international community devoted to human unity. The Mother’s spiritual work was concerned with activation of the highest human spiritual potential and the transformation of the physical body at the cellular level (Shirazi, 2009b). Sri Aurobindo and the Mother affirmed on numerous occasions that their consciousness were one and the same.

Haridas Chaudhuri (1913-1975), an Indian professor of philosophy who wrote the first doctoral dissertation on the works of Sri Aurobindo stated:

> The philosophy of Sri Aurobindo is all-comprehending in its integration of the past, and prophetic in its vision of the future. As a connected view of the totality of existence, it brings to light the ultimate unifying principle of life. On the basis of a balanced appreciation of the multifarious values of life, it shows how to reconcile the various conflicts of our human existence. Out of a broad survey of cosmic evolution it evolves a creative idea which bids fair to impart a new rhythm to the historical order. In reaffirming the central truths of ancient wisdom in the context of our present-day problems, it creates new values and opens up new vistas of human progress. In an endeavor to meet the challenge of the present age, it gives a new dynamic form to the spiritual heritage of the human race—a unified and integrated form to the highest cultural values of East and West.

> With a penetrative insight into the profound meaning of life it lays the foundation for a complete art of harmonious and creative living. (Chaudhuri & Spiegelberg, 1960, p. 17)

In the fall of 1950 Haridas Chaudhuri was invited by Frederick Spiegelberg—a spirited professor of Indic and Slavic studies at Stanford University who was charged with the task of forming the core faculty of a new and unique pioneering graduate school called the American Academy of Asian Studies in San Francisco—to come to America to bring his expertise on Integral yoga and philosophy to a dynamic educational exchange that made a major contribution to the cultural and spiritual life of the San Francisco Bay Area, and eventually to other parts of the western hemisphere. Later Chaudhuri implemented his integral vision of higher education in the initial curriculum design at the California Institute of Asian (now Integral) Studies.

The following statement by Chaudhuri provides the context in which the need for an integral approach to education becomes apparent.

> The widespread discontent of modern youth the world over is a manifestation of the hunger of the soul for authentic and universal spiritual values. It is also an expression of disenchantment with established educational systems with their overemphasis upon intellectual, vocational, and technological values. Out of the inner anguish of fragmented living, there is a passionate reaching out for wholeness of being. Without the balancing of the intellectual with the emotional, the vocational with the spiritual, and the technological with the humanistic dimensions of human existence, it is rightly felt that man cannot be fully human. Nor can he be fully happy without the full flowering of the holistic urge inherent in life. (Chaudhuri, 1974, p. 50)

This is as relevant today as it was at the time of the publication of this statement.

Shortly before his passing Chaudhuri summarized his basics ideas on integral education in an article titled *Education for the Whole Person*. He wrote: "… integral or holistic education does no doubt pose a serious challenge to all those responsible for curricular development in educational institutions. It poses a new responsibility of serious proportions upon all teachers and educators with sincere dedication" (Chaudhuri, 1974, p. 51).

He summarized his fundamental principles of integral education in the need for inclusion of following five aspects: "(1) The physical or bodily aspect; (2) The socio-ethical aspect; (3) The instinctual-emotional aspect; (4) The cognitive-pragmatic-vocational aspect; (5) The religious-mystical-humanistic aspect. " (p. 51) These various dimensions were consequently reflected in the academic curricula of CIIS programs in the 1970s, 80s and 90s and class syllabi were structured according to three broad dimensions: Cognitive/didactic, experiential/self-reflective, and applied/practical.

As Ryan (2005) summarized:

> There may be numerous facets to the ideal 'Integral' education, but three stand out. First, the Integralists believed that education should be of the whole human being; it must involve the physical, the emotional, the mental, and the spiritual. Second, it must be global and have

> reference to the, “total human situation” ... Third, it must attempt to surmount the contradictions and antagonisms inherent in ordinary human cultural and philosophical positioning. (p. 25)

A more systematic attempt was undertaken in the first decade of the 21st century at CIIS to reflect on what integral education means and how various academic programs interpret and apply its principles and practices in their respective fields. As part of this process, the Integral Education Committee produced the following definition for integral education.

> Education at CIIS is designed to foster rigorous intellectual development and personal growth through self‒reflection. We believe that teaching and learning are most effective when they recognize and reflect diverse ways of knowing and connect difference and similarity. CIIS advances the education of the whole person (body, mind and spirit) by integrating knowledge of the interior and exterior dimensions of our lives. Committed to building a better and more inclusive world, academic programs encourage students to pursue inquiry that transcends disciplinary boundaries and situates their work in communities outside their own.

Some of the work of the members of the Integral Education Committee and other faculty were published in two consecutive issues (fall 2005 and winter 2006) of the journal *ReVision*.

In his CIIS commencement address, Parker Palmer (2007), a contemporary leader in holistic education, described CIIS in the following way.

> What happens at CIIS is very nearly unique in the world of higher education. It is also revolutionary, and probably has more revolutionary potential than those of us who are dedicated to this form of education may realize…. And what is the revolution I have in mind? It's an intellectual and cultural transformation that takes the reality and power of the inner world just as seriously as our culture takes the reality and power of the outer world. It's a revolution that links inner and outer, that rejoins soul and role, that understands that the world we live in is constantly being co-created by the interplay of what is within us and what is around us. It’s a revolution in which we understand that no one is truly educated until heart and mind have been joined with action and we have learned to think and act the world together rather than think and act the world apart.

Integral Worldview: Fundamental Assumptions

In the chapter on education, in his book, *The Evolution of Integral Consciousness*, Chaudhuri wrote:

> We are living in the twentieth century and we are citizens of the world. It is for us to be able to draw on the limitless wisdom of East and West and North and South. That is the great privilege of modern man. The cultural heritage of the entire human race is open to him. Wherever there is truth, wherever there is wisdom, we can freely draw upon it and bring it together in a grand synthesis. (Chaudhuri, 1977, p. 43)

Based on my conversations over several years with two of Haridas Chaudhuri's closest colleagues and founders of the first two programs at CIIS, Paul Herman and Dionne Sommers, I have put together the following list of ontological and epistemological principles and assumptions that inform the integral worldview and, by extension, the philosophy of integral education.

1. Balance and harmony are the ultimate laws of life and the essential goal of existence;
2. Experience of higher truths presuppose and result from an integration of all levels of consciousness: unconscious, sub-conscious, conscious, and supra-conscious;
3. Highly integrated consciousness is characterized by transcendence of the dualistic framework characteristic of mentally-dominated consciousness (the common fabric of human consciousness at the present stage of evolution);
4. At highly integrated spheres of consciousness the duality between subject and objects of experience (self vs. the universe) disappears;
5. Duality reflects the polarized structure of reality; it is a fact of life. Dualism, or dualistic thinking, however, is the natural product of the ordinary mental functions that results in perception of opposites as essentially independent (rather than complementary) aspects of a vaster unified reality;
6. Reality is a multidimensional whole. All diversified appearances are expressions of a unified whole;
7. Due to this multidimensional nature of reality all *truths* are valid in specific places for specific durations of time;
8. Any principle taken to its extreme transforms into its own opposite;
9. Reality can be found half way between truths and falsehoods;
10. Truths and falsehoods are characteristics of statements or theses about reality. Reality transcends truth-and-falsehoods;
11. Increasingly holistic truths can be arrived at through the method of *integral dialectics* (also known as dialectical synthesis);
12. Integral dialectics is the application of an organismic dialectical process to the totality of human *onto-psycho-somatic* (spirit/mind/body) organism;
13. Symbolic abstractions (such as language and thought etc.) are not capable of representing the whole of reality;
14. The same truth can be expressed in different conceptual frameworks.

Key Assumptions of a Holistic Paradigm in Healing

The integral framework holds that healing and wholeness are intimately interconnected. As the etymology suggests, the Greek word *holos* is the common root of the terms: healing, health and wholeness.

1. Human beings have a natural right to, and an *innate potential for*, *wholeness;* and *urge toward wholeness* is the primary motive in human life;
2. This essential wholeness is already present at the innermost core of the human psyche and our evolutionary challenge is to manifest this wholeness in our embodied existence;
3. Healing is the process of *restoration of wholeness*;
4. Reality is more than a mental construction—it is *non-dual* and *multidimensional*;

5. This implies that mentally constructed categories and labels about mental health or illness are not always capable of representing the more complex reality of lived experience. To fully understand human developmental growth and its impediments, one must take into account the uniqueness of each individual;
6. Mental disorders are not ultimately separable from physical, emotional, and spiritual problems; therefore, diagnoses and interventions must take into account the whole person; often symptoms manifested at one level have roots originating at another level.
7. Psychological disorders may be multi-faceted and their causes are not always reducible to physical (genetic or biological/biochemical) factors.
8. We need to have viable models for understanding human health and wholeness, rather than the current clinical models that tend to use only pathological categories for clinical assessment and treatment.

In the larger world today, there is a need for new viable models of optimal psychological health and healing based on the whole-person understanding. Clinical and psychotherapeutic assessment is still done primarily on the basis of psychopathology and clinical categories. Such models need to take into account not only mental, but emotional, spiritual and physical dimensions of human existence and their complex relationship during the course of lifespan development.

Almost half of CIIS students are enrolled in counseling and clinical psychology programs that acknowledge and work with the above principles in their academic and professional training.

I conclude with the following words by Haridas Chaudhuri:

> We are going through a very transitional period of terrestrial evolution. In this period of transition and transitional crises, all the latent contradictions and discrepancies of human nature come to the foreground of our consciousness, resulting in a very chaotic situation in the fact that we see so much darkness around us. However, Aurobindo reminds us that the night is darkest before the dawn. It is also the strategy of nature that, as these things come to the front, as our problems come out in all their nakedness, we have a chance to understand them, and do something about them. The problems that we see today—the problems of division and separation, the problems of conflict and crisis—are ultimately traceable to the level of consciousness on which we are functioning now; that is, the mental level. (Chaudhuri, 1979, p. 6)

CIIS and American Higher Education

Joseph L. Subbiondo[1]

Abstract: In this article a brief history of the California Institute of Integral Studies and its predecessor institution, the American Academy of Asian Studies is discussed, and several key founding figures of both institutions are introduced. It is argued that the role these unique institutions of higher learning have played have been crucial, initially in the cultural life of San Francisco Bay Area and the social and cultural movements it inspired, and currently in the context of the role that an integral, whole-person oriented education plays in higher education.

Keywords: American Academy of Asian Studies, California Institute of Integral Studies, Haridas Chaudhuri, Louis Gainsborough, Paul Herman, higher education, integral education, San Francisco Renaissance, Alan Watts.

Introduction

The story of the California Institute of Integral Studies (CIIS) serves as a living case study—a work in progress that documents that a university can maintain academic credibility and institutional accreditation while challenging the prevailing dualistic educational model. Moreover, it demonstrates that an institution can even thrive in this progressive approach to higher education. CIIS faculty members and students are drawn to, and remain at, CIIS because of its unique pioneering model of integral education.

Louis Gainsborough and the American Academy of Asian Studies

The story of CIIS begins in 1951 with the founding of the American Academy of Asian Studies in San Francisco by Louis Gainsborough and the arrival of two of its most prominent professors: Alan Watts and Haridas Chaudhuri.

Louis Gainsborough, a business entrepreneur and importer, traveled throughout Asia and became convinced that world peace depended upon an enduring and collaborative relationship between the East and the West. He was so moved by the embodied peace message of Mahatma Gandhi that he produced a documentary film featuring rare original footage of Gandhi. In 1957, on the day following his second inauguration, President Dwight Eisenhower screened

Gainsborough's film at the White House with Jawaharlal Nehru, then prime minister of India, and Gainsborough present.

Recognizing that education was critical in creating an enduring East/West relationship, Gainsborough founded the first graduate school in the United States exclusively devoted to a study of Asia—the American Academy of Asian Studies. Gainsborough's launching of the Academy was a courageous act because of the contentious anti-Asian sentiment in the US: in 1951, the United States was still in the wake of its war with Japan and it was actively engaged in the Korean conflict. Nonetheless, Gainsborough persevered in his vision and his Academy not only led to the creation of CIIS later in 1968, but it also contributed much to shaping the San Francisco cultural milieu of the 1950s and 60s. Over the years, the intersection of the Academy, CIIS, and San Francisco Renaissance significantly influenced the integration of Eastern and Western wisdom traditions throughout the US and the Western world.

Alan Watts

In 1951, Alan Watts (1915-1973) arrived at the Academy. By then, Watts had published eight (of his eventual twenty-two) books as well as many essays on Eastern religious and spiritual traditions, particularly Zen Buddhism. He was established as one of the leading writers and teachers of Eastern mysticism. Through his scholarly reputation and personal connections, Watts positioned the Academy to be a principal meeting place for artists, writers, teachers, activists, and practitioners of the emerging counter-cultural movement of the San Francisco Renaissance.

As Monica Furlong (1986) noted in her biography of Watts, the counter-culture movement in San Francisco with its new ways of thinking contributed immensely not only to "normalizing" Eastern religious and spiritual practices in the US; but it also provided a catalyst for the national, and often international, 1960's movements in civil rights, anti-war, environment, and transpersonal psychology. In his autobiography, In *My Own Way*, Watts (1972/2001), looking back at the 1960s, extensively and convincingly documented that "The American Academy of Asian Studies was one of the principal roots of what later came to be known, in the early sixties, as the San Francisco Renaissance…" (p. 232).

Watts' account of the spirited debates among the founders of the Academy sheds light on the early evolution of humanistic and transpersonal psychology during this period in the United States. Some founders of the Academy (particularly Gainsborough) wanted the Academy to offer studies of Asian culture to prepare people to engage in business in Asia while others (Watts and Chaudhuri among them) "were concerned with the practical transformation of human consciousness…" (Watts, 1972/2001, p. 234). Watts indicated that the latter group prevailed, and the Academy cultivated "the actual living out of the Hindu, Buddhist, and Taoist ways of life at the level of high mysticism: a concern repugnant to academics and contemptible to businessmen, threatening to Jews and Christians, and irrational to most scientists" (Watts, 1972/2001, p. 234).

Watts played a critical role in developing the Academy's weekly colloquia that attracted many of San Francisco's leading artists, writers, psychotherapists, and scholars as well as visiting guests like D.T. Suzuki.

In these dialogues, as Watts pointed out, the participants of the colloquia mixed rather than mixed-up the disciplines. Watts recalled with heartfelt appreciation his many dialogues with Chaudhuri who with "his gentle humor and learned mind made him a wonderful partner in debate, so that we could argue endlessly without losing tempers" (p. 235). The students who attended these colloquia included Michael Murphy and Richard Price who later established the Esalen Institute at Big Sur in 1962, as well as Gary Snyder, who became a noted poet, professor of literature, and the inspiration for the character "Japhy Ryder," the Buddhist beatnik hero, in Jack Kerouac's (1958) *The Dharma Bums*, the classic novel on the San Francisco Renaissance.

In 1961, Watts published his views on the integration of Eastern wisdom traditions and Western psychology in his book *Psychotherapy East and West* (Watts, 1961/1975). By the end of the 1960s, Watts would comment on the emerging themes of his day—themes that were swirling around the Academy and the soon-to-be California Institute of Asian Studies:

> I have the impression that the psychiatric world has opened up to the possibility that there are more things in heaven and earth than were dreamed of in its philosophy… The field is giving way to movements and techniques increasingly free from the tacit metaphysics of nineteenth-century mechanism: [these include] Humanistic Psychology, Transpersonal Psychology, Gestalt Therapy, Transactional Psychology, Encounter Therapy, Psycho Synthesis, … Bioenergetics, and a dozen more interesting approaches with awkward names. (Watts, 1961, p. 337)

Watts' brilliance and charisma brought attention to the American Academy of Asian Studies, the predecessor of CIIS. Moreover, Watts greatly influenced Chaudhuri and their mutual colleagues in setting the agenda for the founding vision of CIIS. Years after leaving the Academy, Watts acknowledged the success of Chaudhuri in continuing the work they had begun at the Academy twenty years earlier. He wrote: "Haridas Chaudhuri went off on his own and replaced it [the Academy] with the California Academy [sic] of Asian Studies, which is where something of the original tradition of the work is now alive and kicking quite interestingly" (Watts, 1972/2001, p. 277).

Haridas Chaudhuri

In 1949, Haridas Chaudhuri (1913-1975) earned his Ph.D. in Philosophy at Calcutta University, submitting a dissertation on the integral philosophy of Sri Aurobindo. Chaudhuri was recognized as the leading scholar and commentator on the extensive works of Sri Aurobindo (1872-1950) even by Aurobindo himself; and he was appointed to the Academy, the predecessor of CIIS, to teach courses on the works of Aurobindo within the context of the panoramic landscape of Eastern philosophical and spiritual traditions. Chaudhuri included many of the original educational themes of the Academy as he developed the California Institute of Asian Studies (later changed to Integral). In 1981, the Institute was granted regional accreditation which meant that the Institute's students would be eligible for federally funded financial aid and the institute was a member of the national community of colleges and universities. Throughout his years preparing the Institute for accreditation, he never lost sight of the urgent need in higher education for integral education: he wrote "The educational system, as it operates today, does not take into account the whole person, nor does it take into account the whole world" (Chaudhuri, 1977, p. 78).

Chaudhuri (1977) maintained that Aurobindo provided a complete art of integral living because his work points the way to dynamic integration of the material and spiritual values of life. It is a call to the reconstruction of human life and society on the basis of abiding spiritual values (pp. 135-136). Chaudhuri's definition of the "art of integral living" as "the dynamic integration of the material and spiritual values of life" is especially relevant to our assertion today that higher education needs to develop an integral approach to education. Chaudhuri's assessment of the state of higher education is as pertinent today as it was a half century ago: it continues to influence integral educational programs as evidenced by Ken Wilber's (2006) aspiration for his Integral University that it "cultivate body, mind, and spirit in self, culture, and nature" (p. 32).

In *The Evolution of Integral Consciousness*, Chaudhuri (1977) clearly stated the need for higher education to include a holistic view of the human being:

> It is important to have a comprehensive, holistic, integrated view of humanity. The integral view of … [humanity] implies that no individual is a separate self-existent entity. Just as the different elements of our nature—body, mind, spirit—are interrelated aspects, in the same way, every individual is a factor in a social continuum… Individuality conceived as a self-existent atom is an abstraction of our mind; it does not exist. Nobody lives by himself. Human beings become more and more human through social interrelations, interactions. (p. 74)

Chaudhuri's vision of integral education, like that of Alan Watts, was based on connecting the cultural traditions of the East and the West:

> The integral world view and integral thinking are in truth two sides of the same coin …. The method of integral thinking represents a dynamic integration of the scientific, phenomenological and dialectical methods of the West and the self-analytical, psycho-integrative, nondual values of the East. (Chaudhuri, 1977, p. 85)

Like Gainsborough, Chaudhuri was convinced that global peace depended upon profound connection between the East and West and he recognized the need to include Indian core values in Western education. To implement this vision, Chaudhuri and his colleagues developed a new vision of theory and practice in psychology by integrating Aurobindo's psycho-spiritual perspective and integral method with the new and growing academic and professional field of counseling psychology. Integral counseling psychology has been central to the educational mission of CIIS because it blends what Chaudhuri considered the best in the East with the best in the West. Brendan Collins, a CIIS professor who studied with Chaudhuri, recalls that Chaudhuri often said that he thought that spirituality would return to the West not through philosophy or religion, but through psychology.

Unfortunately, Chaudhuri’s formulation of a unique program in integral counseling psychology was cut short by his untimely death in 1975; however, the initiative was completed by Paul Herman, Professor of Psychology who began teaching at the Institute in 1969.

Paul Herman

In 1973 Paul Herman designed the Institute’s first independent program— a graduate degree in integral psychology that was based on his and Chaudhuri’s collaborative vision. He appropriately entitled the new program “Integral Counseling Psychology.” To ensure the long term viability of the new program, Herman (1972) insisted that it be clinically professional and state credentialed in order to prepare students for employment in various counseling sub-specialties, such as developmental, vocational, rehabilitation, mental health, marriage and family, and transpersonal and yoga counseling. The degree program was designed to fulfill the suggested education and training standards of professional counseling and psychological associations, both state and national, and to profit by the close collaboration of specialty groups in humanistic and transpersonal psychology as well as those concerned with innovations in parapsychology and healing.

The Integral Counseling Psychology (ICP) degree was launched in September of 1973. In his announcement, Herman credited Chaudhuri for the original concept of the program stating that the degree was developed according to the integral view of the late Haridas Chaudhuri in including the major spiritual traditions of East and West, recent cultural and social science research, and the writings of leading humanistic and transpersonal psychologists. Writing ten years later, Herman reiterated his founding vision for the program. In a paper published in 1983, Herman defined Integral Psychology as:

> … an emergent East-West study of the human psyche. It draws upon the findings of both Western depth psychology, and ancient Eastern teachings and yogas, to express a whole, unfragmented view of human nature which does not remain merely theoretical, but also functions to resolve human conflicts and open the way toward activating high levels of potential … it includes the whole range from protohuman awareness to expansive transcendent experience. (Herman, 1983, p. 95)

In that same paper, Herman echoed Gainsborough’s anticipation that education could be a principal catalyst for world peace:

> Integral psychology, as a science of the psyche or soul, concerns itself with whole potential of human consciousness. Thus it looks forward to a full transformation of the manifest cosmos, including humankind, in the evolutionary future. All human beings may assist in cosmic evolution, as well as help resolve personal, social, national, and international conflicts, by centering consciousness at the innermost core of the being until its guidance and energy are activated. (Herman, 1983, p. 1)

By insisting at the outset that the program would only accept and graduate students who could demonstrate competence in both the classroom and the counseling center, Herman assured that the program would not only meet the standards of accreditation but also that its graduates would find professional acceptance. After meticulously grounding the program in the requirements of established programs in counseling psychology, Herman integrated Eastern perspectives into the program. In the end, the program had more required courses than that of traditional counseling psychology programs. To this day the Integral Counseling Psychology Program is one of the most sought after courses of study at CIIS.

Conclusion

Huston Smith, revered historian of religious and spiritual movements, commended CIIS for its role in advancing US higher education:

> In the course of decades, American higher education has created tradition-bound ruts and it works in those ruts. Consequently, it is vitally important that mainline universities be complemented by alternative programs that are not stuck in those ruts. CIIS is the best of these alternative programs that I know of. (Smith, n.d.)

We are blessed to be living in an age in which unprecedented global and cultural shifts are enabling us to get beyond our many “tradition-bound ruts” in higher education that have held us in place since the seventeenth century. While many faculty members and administrators may not have changed their educational visions, the students have. This change is evident in the extensive longitudinal research on university students and their spirituality that is being conducted by UCLA’s Higher Education Research Institute (UCLA, 2006). The surveys reveal that the fastest growing group of university students in the US is those who identify themselves as spiritual non-religious. Fortunately, CIIS is not alone in meeting the needs of the changing student population. Higher education currently faces challenges not only in supporting curricular changes to include, interdisciplinary, integrative, and transpersonal studies but also supporting the pedagogical shifts and the life style changes that reflect a holistic worldview.

Evolving Dimensions of Integral Education

Judie Gaffin Wexler[1]

Abstract: This article explores the concept of integral education as a way to prepare students for the complex, rapidly changing global environment in which they will be living and working. It contends that education must help students focus both internally and externally if they are to be effectively prepared. The experience of the California Institute of Integral Studies is used as a case study to discuss key dimensions of integral education.

Keywords: Contemplative practice, diversity, education, holistic, integral, interdisciplinary, transformative.

Introduction

In this paper I will be examining the concept of integral education using the California Institute of Integral Studies (CIIS) as a case study. CIIS is a university based in an integral worldview and created out of a critique of American society and higher education. Now, over 40 years later, we are in another turbulent time in which we are considering if and how higher education prepares students for the future. As the 2007 report on *College Learning* by the Association of American Colleges and Universities (AAC&U) has put it,

> In this global century, every student—not just the fortunate few—will need wide-ranging and cross-disciplinary knowledge, higher-level skills, an active sense of personal and social responsibility, and a demonstrated ability to apply knowledge to complex problems (AACU, 2007, p. 11).

AAC&U looks to liberal education to provide this; I believe that the innovations that come out of the integral and transpersonal approaches have the potential to move us even further toward the kind of transformation that is needed.

Integral Education

Over the last few years at CIIS we have spent a lot of time discussing what we mean by integral education as we practice it in the 21st century. As part of this discussion we have gone back to our roots to look again at the goals and philosophies of our founding as well as at the multiple realities of our present day university. The schools, programs and faculty that make up academic life at CIIS are interconnected by common mission, history, values and concerns.

---

SOME RIGHTS RESERVED

Our integral education project has focused on identifying common dimensions without creating a statement of orthodoxy. Being careful to leave room for creativity and innovation, there is no CIIS checklist against which every program is to be measured but there are dimensions that each program expresses. The dimensions are the visible manifestations of the holistic education we strive to provide; they emanate from a mission that strives "to embody spirit, intellect, and wisdom." Part of our understanding of integral is that it allows for dialogue between incommensurable truths and for the holding of paradox. In the face of pressures to tie everything together, it allows for the recognition that this is not always possible or desirable.

In writing about education at CIIS, I want to focus on a few key aspects:

- What it means to provide an accredited education that includes the spiritual aspects of human life;
- The dimensions of integral education we have identified; and,
- The implications of the higher education context in which we do this work.

Underlying academic life at CIIS is a worldview that holds that the spiritual dimension is important; as an educational institution we seek to embody the spiritual as part of the intellectual. As a university we must make sure that we provide our students with the knowledge and thinking skills central to advanced education. As an integral university we want to do more; we want to also support them in exploring their interior lives and the intersections between that and their academic work.

There is a creative tension here as we try to hold the paradoxes that arise out of competing paradigms. The two do not fit together seamlessly but, I believe, it is in the tension between them that our most creative and important work arises. As an accredited university we have to meet the expectations of the dominant paradigm. Those goals sit side-by-side with other more transformational aspirations. In combination we have the potential of addressing the knowledge and characteristics needed in these complex and rapidly changing times.

We have identified five dimensions of integral education:

- Multimodal, valuing different ways of knowing;
- Integration of intellectual rigor and personal (including spiritual) growth;
- Transdisciplinarity and integrative;
- Social relevance and interface with the external world; and,
- Space for difference in the curriculum and classes.

One could argue, and I would agree, that these dimensions are found in varying degrees in many higher education institutions. However, I contend that the worldviews that form the context for them at CIIS differentiate them from similar practices in universities formed by other world views.

Brant Cortright, in his book *Psychotherapy and Spirit*, asks what transpersonal psychology looks like in psychotherapy, "Is it shown by what the therapist does or how the therapist is?... Are there some common principles, methods, guidelines which characterize a transpersonal approach?" (Cortright, 1997, p. 7). I think the same questions can be asked about education that is transpersonal or integral. Is it shown by what the educator does or by what the educator is? While it is easy to focus on techniques, it is not the techniques that are definitive. Instead, I think that it is the worldviews that are definitive. It is what the educator is.

Spirituality and Higher Education

The incorporation of the spiritual into higher education is not without its controversy. This kind of inner work has been regarded as personal and subjective, and so as unrelated to the reasoning and logic that are more appropriately the domain of education. There is also some concern that the incorporation of spirituality is code for a religious litmus test or a denial of science. On the other hand, learning is never solely an objective enterprise. What people learn and how they understand what they learn is always related to previous ideas and existing conceptual frameworks.

Spirituality is clearly important to American college students and faculty. Over half of American college students place a high value on integrating spirituality into their lives and more than two-thirds report having had a spiritual experience (Astin, 2004). Spirituality is not only important to the students, survey data indicate that 40% of American faculty can be described as high in spirituality (Lindholm & Astin, 2006, p. 69). Can we really ignore this as we try to educate students for the future in a world that is highly complex, rapidly changing, and increasingly globally interdependent? Why would we even want to?

Dimensions of Integral Education

Multimodal, Valuing Different Ways of Knowing

A place of creative tension here is to offer students opportunities for the rational, cognitive learning that is basic to higher education while also pursuing approaches that open students to new and creative awareness. Higher education by its very nature emphasizes cognitive learning and understanding expressed in words. While we increasingly recognize the prevalence of multiple forms of intelligence reflected in different learning styles, the college classroom tends to address learning from a verbal perspective and students have to be able to present their ideas in written form. Contemporary reform dialogue is framed in terms of improving learning outcomes, providing students with opportunities to enhance their learning through application, analysis and evaluation.

Classroom practice at CIIS of course includes lecture, discussion, small group work and project based experiences. In addition to all of these conventional approaches to learning that are found at any American university, one will also find meditation, movement, drama, art, and poetry used as ways to bring students into the present and open them to different kinds of learning and consciousness.

Some of these approaches to knowing now fall into the category of evidence based practice—there is effectiveness research that connects them to student learning. We know, for example, that meditation can increase learning and memory. We know that other approaches can help people access their preconceptions and work with them in a way that opens them to new learning. These approaches can be used as techniques to achieve better learning outcomes and also as ways to support deeper awareness and learning that incorporates the ineffable. Education here seeks to help people integrate the interior and exterior dimensions of life and in doing so provides for stronger and more lasting learning and sense of personal responsibility.

A survey of 2001-2010 CIIS graduates confirmed that students experienced this dimension in their education. The percentage that agreed or strongly agreed with the statement is provided in parenthesis.

- My education included multiple ways of knowing, including experiential learning, collaborative learning, and the use of media and art. (92.4%)
- My education expanded my approaches to learning and helped me appreciate the approaches of others. (91.3%)
- My education facilitated the integration of body, mind and spirit in a significant way. (88.1%)

Integration of Intellectual Rigor and Personal (including Spiritual) Growth

Higher education is explicit in its expectation that intellectually rigorous learning is an outcome; typically that goal for rigorous learning is articulated in cognitive and rational terms. There is usually also an implicit expectation that students will grow in other ways during their years in college.

As part of integral education, we see the two as being inextricably tied together not just as occurring on parallel tracks. Academic work is seen as fostering personal growth and personal growth is seen as fostering academic work and growth. Self-reflective papers and contemplative, experiential and participatory experiences within the classroom all connect personal growth with growth in understanding, knowledge and thinking. Learning is supported by helping students make explicit their beginning understandings and frameworks and by helping them reflect on their own understanding and the connections they make. The theory of education is a holistic one that integrates the personal and the intellectual and seeking to go to deeper levels of understanding and transformation. As bell hooks (1994) has written,

> Our work [as teachers] is not merely to share information but to share in the intellectual and spiritual growth of our students. To teach in a manner that respects and cares for the souls of our students is essential if we are to provide the necessary conditions where learning can most deeply and intimately begin. (p. 13)

Many students come to CIIS as a step in a perceived journey toward increased self-discovery and awareness. These transpersonal goals are important in connecting faculty and students as co-creators. Our challenge as an educational institution is to keep personal growth and intellectual rigor in balance; in this we are different from more traditional educational institutions in which the intellectual is abstracted from the personal.

Here our tension is that in seeking to make room for personal and spiritual growth we need to also be attentive to ensuring that our students are offered rigorous intellectual work and are encouraged to think critically. It is in the balance of the two that we are at our very best as each strengthens and deepens the other.

The techniques that access multiple ways of knowing typically also support personal growth and development. In utilizing them in a context of rigorous academic learning they also support the latter. Thus much of what we do out of transpersonal understandings also act to enhance learning and better prepare students for the contemporary world.

Returning again to the graduation survey data, there was very strong support for statements specifying that graduates had experienced this dimension.

- My education facilitated my personal growth. (95.9%)
- My education facilitated by intellectual growth. (93.6%)

Transdisciplinarity and Integrative

Education at CIIS seeks to be integrative across disciplines and educational experiences. Just as the problems and key questions of the contemporary world do not fall into neat disciplinary boxes, inquiry does not fall into neat boxes created by courses and semesters. We want our students to be able to pursue questions that transgress boundaries and to seek new ways to bring ideas together. The focus comes to be more on the inquiry than on the discipline. Such a focus on inquiry and integration is one way to address the fragmentation of knowledge that has been created by the division into disciplines and subdisciplines. At the same time, it is vital that students go deeply enough into some area of study that they have the conceptual frameworks with which to organize their ideas. Of CIIS recent graduates, 83.5% agreed or strongly agreed with the statement: My education prepared me to engage in interdisciplinary and transdisciplinary inquiry.

Social Relevance and Interface with the World

According to Haridas Chauduri (1977), integral education is “education which is based upon the concept of the total man [person] and education which is based on the total human situation, the global situation” (p. 78). The integral, holistic tradition at CIIS supports an approach that does not separate learning from preparation for action in the world. Increasingly, students come to CIIS who want to make a difference and seek the tools to be able to do so. Course material connected to meaningful action in the world, group work and opportunities to apply learning to real-world settings also build knowledge and understanding that goes beyond preparation for a particular task at a particular time. Action is framed by theory and imagination.

To give one example: last fall we opened our Clinic Without Walls, an attempt to bring psychological services into housing projects in San Francisco. Unlike our other clinics, this one does not wait until people decide they need/want to come for therapy and make an appointment. In this clinic, students build relationships and community within public housing to open people to the possibility of therapy and to provide it within the community. Graduates indicated agreement or strong agreement with the statement: My education made meaningful connections between theory and practice (89.4%). A still significant, but smaller percentage agreed or strongly agreed with the statement, CIIS activities and events beyond the formal classes added value to my education and helped me to see it relevance (65.8%).

Space is provided for difference to live in the curriculum and classes

Difference is not something that we can ignore in the world today. Again as Haridas Chauduri wrote:

> Mankind can no longer be divided into exclusive segments so that the fortune of one will not affect the fortune of the other. We live in a world of shrinking dimensions with people of different cultural, religious and racial backgrounds coming together. As it is commonly phrased, either we swim together or we sink together. (Chaudhuri, 1977, p. 77)

If we are to be able to live together we need to be able to better understand each other and to bridge our differences.

Difference is also about different frameworks, ideas, experiences, and ways of understanding. We want to support paradox and different kinds of inquiry as well as respect for cultural, social and economic difference. This work requires inclusion of the personal. The combination of personal and intellectual work can facilitate understanding of difference and the development of skills to work with responsibility in an increasingly diverse world. Without that we run the risk of bringing people physically together and making them more aware of difference without supporting them in learning to feel comfortable with, or understand, difference. However, engaging in this way is not without its challenges.

What happens when ideas, backgrounds, beliefs are in conflict? In an environment that seeks to affirm the individual there is some pressure to maintain an atmosphere that is not conflictual or angry, to smooth over difference in support of feelings of safety and harmony that can actually undercut building understanding. We struggle to see conflict as an opportunity for learning and to develop the skills to deal with and hold difference. Difference may be the most challenging dimension in relation to spiritual worldviews found at CIIS. As Marianne Williamson (1997) has emphasized, “It is our unity and our diversity that matter, and their relationship to each other reflects a philosophical and political truth outside of which we cannot thrive.” (p. 72). And yet, the universality that is emphasized out of our spiritual worldviews at times seems to lead to a downplaying of the importance of difference, especially in terms of considering the dynamics of race, class, gender, and sexuality. It is not uncommon to hear a CIIS student say, I am spiritual, I have moved beyond diversity, not recognizing that worldview does not negate power and class dynamics. At the same time, 83.4% of the graduates indicated agreement or strong agreement with the statement: My education helped me to respond to cultural and ideological diversity by giving me the opportunity to reflect on my own positions (class, gender, sexual orientation, age) and to build connections with others who are differently positioned.

The Higher Education Context

All of American higher education is asking itself questions about how students learn and how to help them learn better. That concern has led to new attention to university teaching and to considerable attention on access, graduation, job preparation, accountability and the measurement of learning. I contend that it is going to take more than reform and increased accountability to prepare our graduates for the demands of this century. It is going to require transformative practice that situates the individual in his/her education.

The concerns have led to demands on universities to demonstrate that their students have learned and to demonstrate what they have learned. At a time when we need people who can think critically, creatively and integratively, the pressure is to show what our graduates know rather than how effectively they can think, or how imaginatively they can apply. While college faculty members generally believe they address the key learning areas and college students generally believe they have acquired some proficiency in these areas, the limited actual outcome data do not support these perceptions.

The data indicate that students are graduating college without high level proficiency in such areas as writing, mathematics, and critical thinking. Such data are compelling and are driving a lot of the accountability and testing momentum currently at work in the US.

However, the needs of this century go much further than that. When we start considering complex learning outcomes such as integration of learning, inquiry, critical and creative thinking, and individual and social responsibility, innovative practices and thinking are needed. We know that it is not enough for people to be able to repeat information; they need to be able to formulate questions, find information and organize and apply it in new ways.

In educating for resilience and resourcefulness, we have to consider the holistic development of our students. While there are many lists of what people are going to need to be able to thrive in this century, a higher education is needed that provides students with the basis for future learning and action and helps them reflect on their own actions, responses, knowledge, relationships and culture. These are exciting challenges and fit well with the strengths of an integral approach to education.

Trans-Dance: Disciplinary Cross-Dressing and Integral Education in a Language and Sexuality Course

Matthew C. Bronson[1]

Abstract: This article showcases an integral approach to education through the lens of a transdisciplinary graduate-level class on Sexuality and Language. The graduate-level class was co-taught by two CIIS faculty whose backgrounds span the fields of social and cultural anthropology, psychology, sociology, social policy, linguistics, education and drama-centered expressive arts therapy. The class brought together students from six separate academic programs and drew from a wide array of performative and arts-based modes of inquiry to create a deep context through which to unpack the complex relationship(s) between language and sexuality. These practices were interwoven with theoretical exposition and discussion in a hermeneutic spiral leading up to students' planned research projects. This "disciplinary cross-dressing," where diverse students and faculty engaged each others' points of view rigorously in a common inquiry, created powerful teachable moments and served as the foundation for a transgressive mode of scholarship and advocacy.

- student in Language and Sexuality course

Introduction and History of the Course

Humans are sexual beings, even politicians and priests, if the headlines of recent years are any indication. We are also intensely social, and language is the primary medium in which we negotiate our joint construction of identity and reality itself. We are what we speak (including gestures, embodied language, etc.), and this includes our presentation as gendered and sexual

beings. The intersection between these two domains, language/communication and sexuality, is a rich and generative area of inquiry that has garnered interest at universities throughout the U.S. and internationally (Cameron & Kulick, 2003, 2006).

Gender studies and allied fields such as queer studies (Yep, Lovaas, & Elia, 2003) are experiencing expansion relative to the general contraction of academic fields and departments now under way. Also, as my Chair pointed out, "any course title with 'sex' in it will tend to fill" and so it is no surprise that dozens of courses are now being taught with titles such as "Gender and Communication." This was not meant to be just another course, however; the case is especially relevant for this audience because it also aspired to incorporate the principles of integral education. It was designed to truly engage students in deep learning by connecting critical reflection on their own stories as sexual beings with the formal material of the course.

I will briefly summarize some relevant strands from ongoing conversations about integral education and how it has been framed at my university and elsewhere. I report here on the course with the main intention of claiming some lessons in the praxis of integral education (Bronson, 2006, 2005)—that is how some key ideas from integral education as it is currently understood at my university have been translated into specific classroom practices and relations. Finally, I present a sketch of a framework for assessing such implementations and suggest some avenues for further discussion and research.

The Dimensions of Integral Education

The term "integral" is contested and claimed by different lineages and perspectives. Among them, three are most prominently represented in public discourse: that of Wilber/Gebser (Esbjorn-Hargens, 2010), the Aurobindo/The Mother-Chaudhuri line (Ryan, 2010) and, in education, a more broadly construed approach perhaps most closely associated with "transformative learning" (Mezirow, 1990, 1991; for a different view see Ferrer, Romero & Albereda, 2010). All of them share an emphasis on the evolutionary and transformative potentials in human consciousness and experience and an intention to expand the modes of knowing that are valued and developed in this enterprise (Ferrer & Sherman, 2008). Thus, the problematic dichotomy between "objective" and "subjective" modes is directly engaged in integral education, rather than taken as a matter of common sense:

> As a university we must make sure that we provide our students with the knowledge and thinking skills central to advanced education. We cannot in good conscience do any less. In actuality we want to do more; we want to also support them in exploring their interior lives and the intersections between that and their academic work. There is a creative tension here as we try to hold the paradoxes that arise out of competing paradigms (Wexler, 2010, p. 2).

The "creative tension" to which Wexler (The Dean and Academic Vice-President of California Institute of Integral Studies.) refers, presents itself in what my colleagues and I have identified as the key dimensions for integral education as we understand them at CIIS. After several years of inquiry, publication, and discussion, we came to see it would not be useful to thematize "integral education" as necessarily separate from the best in liberal (AACU, 2011) or emancipatory (Freire, 1970; hooks, 1994, 2003) education or to think of it as a single ideology and closed set of necessary and sufficient conditions.

We came to our dimensions via a “grounded theory” approach of asking our colleagues and students for examples of what would count as integral education in practice and then inferred the underlying commonalities over many years of iterative dialogues. We were comfortable with articulating integral education (in practice) as a nexus of related dimensions or values with a “family resemblance” (Wittgenstein, 1953) where not every implementation would implement all the features but more robust implementations would. We wanted to identify these dimensions so that we might enhance them through reflection and assessment, where appropriate.

The five dimensions of integral education we identified were:

- Multimodal, valuing different ways of knowing
- Integration of personal growth and intellectual rigor
- Transdisciplinarity: (the integration of knowledge in the service of inquiry)
- Social relevance and interface with the external world
- Space for difference in the curriculum and classes (Wexler, 2010, p. 2).

C.I.I.S. is perhaps uniquely positioned as a place where the various strands of integral education can interact in conversation because there is no dominant ideology or approach. The range of integral theories and practices are rooted in a common commitment to realize more holistic, humane, and sustainable responses to the collective challenges of our day. They aim to address a hunger for alternatives to “business-as-usual” in a world in crisis, to the fragmentation and alienation inherent in the “dominant” paradigm (Bronson & Fields, 2009a, 2009b; Ferrer, 2002; Ferrer and Sherman, 2008).

The dimensions above represent the core common values of our community-of-practice at C.I.I.S., yet are broadly enough construed that others who identify with the overall vision can enter into the conversation, regardless of their affiliation. In education more generally, “integral” has been applied to a range of topics, approaches, methods and interventions (Bronson, 2005; Bronson & Gangadean, 2006; Esbjörn-Hargens, Reams, & Gunnlaugson, 2010). These represent (at least in some measure) different levels of embodiment of a common underlying worldview, one in which the spiritual is not disparate from the practical or intellectual and lived experience and creativity are central in the construction of knowledge (Gangadean & Bronson, 2004; Bronson & Gray, 2010; Bronson, 2004).

I have been a linguist teaching courses at the intersections of language, culture and consciousness at a variety of universities, most prominently in a graduate program in anthropology where I currently serve as faculty. Inspired by a colleague (Gregory Ward), who had been reporting for years about a course on language and sexuality that he had been teaching at Northwestern University, I decided to design a course that would address each of these elements. I enlisted the support of another colleague, Shoshana Simons, who is the Chair of the Expressive Arts Program at C.I.I.S. In the pages that follow, I will share some of the struggles and learning that emerged from the attempt to teach our version of the course with these dimensions as central.

Multi-modal

From the outset, we wanted to include direct experience wherever possible as the foundation for subsequent reflection on the academic content. We were committed to following the hermeneutic spiral from the more concrete to the more abstract. Both of us felt that this was more congruent with how people learn naturally and would give them more robust as opposed to superficial outcomes. We also sought to establish a climate of safety and sharing and knew from past experience that these could be established by the use of ritual and other exercises. In this spirit, our opening experience involved asking students to listen to some soothing music and draw who they were as sexual beings. They subsequently shared with the class whatever they wanted to about the labels and stories that had shaped their identities. We used the introduction of the exercise to evoke confidentiality and to let people know that they should only say what they felt comfortable saying.

This experience became a jumping off point for an extended discussion of the construction of categories (see Whorf, 1956; Lakoff, 1987; Lakoff & Johnson, 1999 for extended discussions). We shared with them how humans construct cultural categories from experience and then use them in place of gathering new information about an environment that is always in flux (Alford, 2002; Whorf, 1956). This was an opportunity to integrate some basic cognitive linguistics into the discussion.

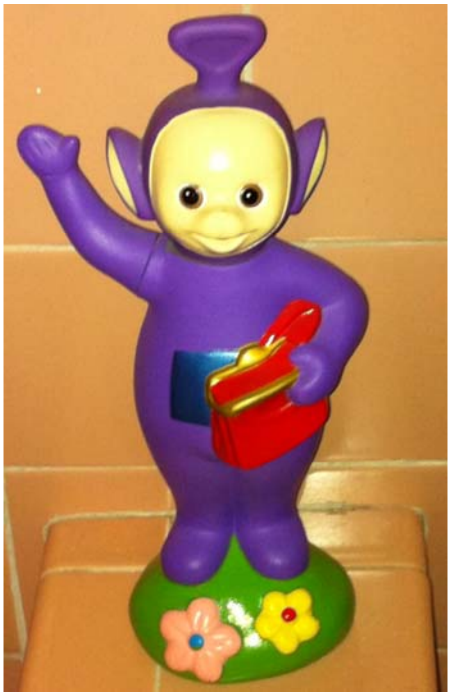

Figure 1: The Tinky-Winky controversy is emblematic of the power of queerness to challenge gender binaries and the fragility of heteronormativity.

At the end of the first evening of the weekend workshop, we continued on the same note: we asked them to go home and look around their homes and personal spaces for objects that touched on some aspect of their sexual and romantic lives. They were to bring these objects, ready to share them with the class as they reflected on their own sexual identity socialization in light of the class material. We told them we would assemble the objects in an “altar.”

I started the altar that night and modeled the activity by sharing three artifacts of my own. I began with a small lavendar plastic figure of Tinky-Winky (see picture), the famous Tele-Tubby with the triangle on his head who was “outed” as gay by Christian Fundamentalists. Tinky was a gift from a friend and immediately gained a place of honor on my personal altar at home. I told the class that he represented for me the power of queerness to bring the dominant into an obviously irrational frenzy simply by the tiniest hint of refusing to conform to heteronormativity. I loved the irony—a television program for 2 year-olds was now being seriously presented as a means of recruiting homosexuals.

This tiny little figure ignited a firestorm among Evangelicals and yet continued to show up each week to “work” in his bucolic green meadow under a smiling sun unscathed by the controversy swirling around him. I explained that Tinky was a model for me as a gay man in his perseverance and power, and even if he were only “questioning”—understandable given his missing genitalia— I would count him as a queer little brother and fellow sacred clown. You might imagine what I shared about a picture of my mother and father as two beautiful young people in love (my mother a virgin), embracing just after taking their vows and years before their subsequent divorce when I was two. A picture of me and a former Brazilian lover dressed as Carmen Miranda was fodder for reflection on gender as performance. I enjoyed showing up as a teacher and a whole person with a history and felt that this in and of itself was a kind of intervention in the business-as-usual of college teaching.

We began with the activity on a Saturday morning with twelve students and two instructors in a small windowless room with the chairs arranged in a circle. One young woman brought a condom and shared what it had cost her to be prepared for safe sex. Many men she dated had been doubly surprised when she had whipped out a Trojan Magnum condom at the critical moment—first that she was apparently ready for sex and secondly owing to the “Magnum” extra-large size of the prophylactic in question. This was enough to end the encounter in some instances. She spoke of the contradictions inherent in being socialized as a sexually active woman who was not “supposed” to want sex.

A young gay man brought a gold wedding band and explained how he had at one point intended to give it to his partner as part of a commitment ceremony. Then, gay weddings were legal for a while and it became a “real” wedding ring. Before they could consecrate the marriage, the law changed and it was no longer “real.” He then broke up with his partner He asked us to look at the ring: “It’s a wedding ring, it’s not a wedding ring, it’s a wedding ring. This is the story of my life as a gay man.” A woman in her thirties who had only recently committed to a relationship with a woman brought photos showing various aspects of her “butch” and “femme” personas. She shared her struggle as someone who was learning how to talk and behave like a “good lesbian.”

Each story and object shared had a tremendous impact on the group and the effect of the ensemble was truly remarkable. We arranged the objects in a corner of the room and left them there for the duration of the workshop. We would dip into them from time to time for a new story, providing a thread of coherence throughout our time together. I found that the possibility of going deep was fully present for us as a group after the initial round of sharing. There were many additional benefits: people introduced themselves and bonded without the usual delay; there were many ready examples to draw from as we explicated the theoretical approaches in the class; the material presence of the objects reminded us of what we had been talking about and energetically charged the room with their storied presence.

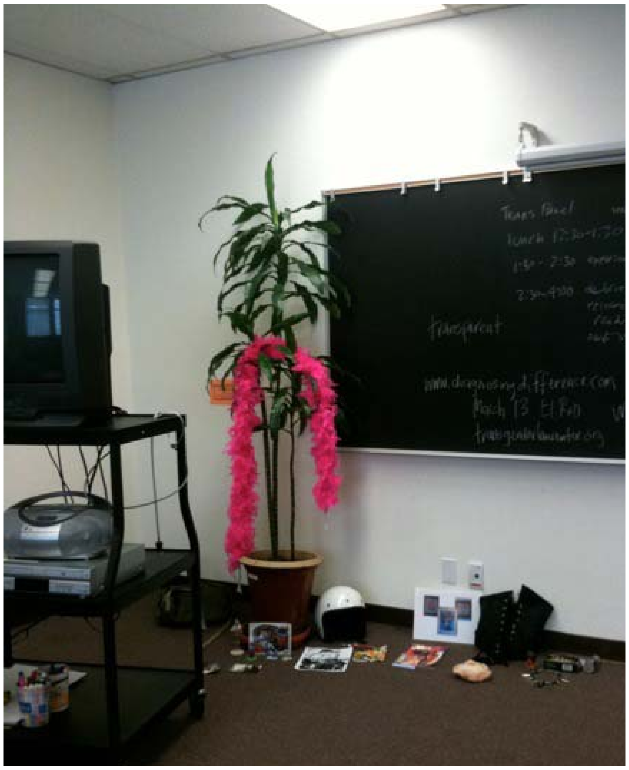

Figure 2: The students composed an altar of personal artifacts in order to elicit story-telling and deepen their connections with the material and each other.

Figure 3: Integral education at its best combines personal engagement with deep intellectual inquiry.

I had a similar experience conducting the exercise with colleagues in a Teaching and Learning Group of colleagues at C.I.I.S. I asked them to bring objects that represented their personal relationship with teaching. We each presented our object then observed the assembled altar, wrote about what we saw and heard and de-briefed as to what we had learned about teaching and learning. We witnessed: a family picture book with pages ripped out, a farmer doll, a pair of eyeglasses, a stone with the word “nothing” engraved in it (“nothing is written in stone.”) My colleagues reported that it was particularly helpful to have been looking for the objects in the two weeks prior to the meeting. It caused them to think deeply about their work and sort through what was really important to them as teachers and learners. They remarked afterwards on the moving quality of the stories and the glimpses into each other’s intimate worlds that would not otherwise have been afforded.

This activity could be adapted to a wide variety of audiences and purposes as a way of getting beyond superficial classroom routines. It has the potential to establish a more intimate rapport among members of any learning community and a more personal and critical engagement with virtually any academic content. To be fair, this is nothing other than “show-and-tell in the 17th grade.” Some of the best teaching still seems to come from the elementary level, in my experience. Our colleagues in Kindergarten can remind those of us in higher education how to enroll the storied things of daily life as our co-teachers.

An epilogue will highlight the relevance of these points for this audience. In a recent workshop I conducted with linguist Gregory Ward of Northwestern University (Bronson & Ward, 2011), I was reminded of the “integral” character of the exercise. When I asked Gregory if he would be able to explore such intimate stories in his upper division Language and Sexuality course, he said that he would not, nor would he be inclined to do so in a mainstream university environment. He wanted students to make direct personal connections to the material, but did not feel that he could directly incorporate an experience of this kind into the curriculum. At C.I.I.S., faculty have the freedom to, indeed are invited and encouraged to interweave the materials and experiences of every day life into the formal curriculum

Integration of Personal Growth and Intellectual Rigor

My colleague Gregory Ward meets his students on an informal field trip to an LGBT venue as part of his course. I chose to do a “cyber-field trip,” where the students were asked to review a web site on gender images in advertising (www.genderimages.com). We discussed the problematic content and the explicit and implicit messages regarding the prototypical gender identities being appealed to. They were then instructed to go to the Craig’s list personals, to a sexual orientation different from the one they identified with *today* (I was aware of the recent embrace of gender fluidity) and to review the language used there for evidence of the underlying values and indices of that corner of the sexual/romantic marketplace.

The students were amazed with what they found. The men-for-men sex ads were a bit shocking for some of them in their explicit description of anatomy and acts. “What is Tina?” asked one student, referring to a coded term for methamphetamine, “What does VGL MM on the downlow mean?” asked another (Very good looking married man looking for discrete sex with another man). In our discussion, we reflected on the roots of the narratives from which each orientation was drawing. We connected with our readings and the complex interplay between biology and culture that lies at the root of sexual identity and desire (Cameron and Kulick, 2003, 2006).

The intellectual work was accompanied by an expansion of the students’ capacity to respond with empathy to sub-cultures that were quite different from their own, not unlike what an anthropologist has to go through in the field. We discussed some of the pre-formed judgments that they had, even some distaste at what they saw depicted. Since these were all students in a graduate-level course centered on an exploration of sexual diversity, this seemed an appropriate teaching moment for combining intellectual content and personal growth

Such “critical moments” (Bronson & Watson-Gegeo, 2008; Bronson, 2009) were woven throughout the intensive weekend portion of the course. For example, a half-day presentation by Willie Wilkinson, a health educator specializing in sensitizing health care workers to the trans-issues, focused on acknowledging existing stereotypes and uncomfortable questions that students had about people with these diverse gender identities. They learned about how to respectfully approach people who were in various stages of transitioning and the importance of separating social identity from biology. The students were deeply moved by the film clips that complexified issues of class, gender and race as the subsequent discussion revealed. As these vignettes have illustrated, the integration of personal subjectivity and intellectual growth, is not a descent into narcissism (Montuori, 2006). It is actually an important part of a more general move toward the "higher ground" of transdisciplinarity (Bronson and Watson-Gegeo, in preparation).

Trans-disciplinarity

Interdisciplinary work is interactive, combining theory, methods and practices to address questions difficult to tackle with the tools of a single discipline (Klein, 1996, Frodeman & Mitcham, 2007). Interdisciplinary work adapts but does not challenge existing boundaries. In contrast, *transdisciplinary* inquiry problematizes disciplinary compartmentalization as imposing limits in creating useful knowledge to address complex issues (Nicolescu, 2002, 2003; Klein, 1998; Stokols, 2006). Centrality of the research questions and the need to reconcile seemingly incommensurable methods for constructing knowledge require greater rigor than is typical of interdisciplinary inquiry, including a nuanced engagement with the researcher's positionality (Montuori, 2006; Alcott & Potter, 1993). Transdisciplinarity has been a hallmark of C.I.I.S programs since its inception. The majority of programs are organized around central themes and inquiries that transcend traditional disciplinary boundaries and require deep, ongoing and critical self-reflection on the part of faculty and students by design.

In practical terms, how was a trans-disciplinary orientation embedded into this course on language and sexuality? It began as so many creative projects do with a conversation I had with colleague Shoshana Simons, the Chair of the Expressive Arts Therapy program. She had worked as a community organizer, organizational consultant and expressive arts therapy educator for many years and had been trained in psychology, performing arts and social science research. She was also an out lesbian who had grown up in the early stages of the feminist movement. We decided to make the course a collaborative effort in which she would specifically attend to our prime directive: that the discussion of academic content should be grounded in some kind of experiential activity where possible.

In the spirit of transdisciplinary inquiry, we specifically wanted to harness materials and perspectives from linguistics, psychology, feminist and criticalist thought, and anthropology to focus on the intersections of language and sexuality. The main texts in the course (Cameron & Kulick, 2003, 2006) prepared the field for us by providing both a coherent, if somewhat polemic master narrative, and ample source material for students' independent research in an area of interest.

I saw my job as a linguist to use the opportunity to introduce the idea of "linguistic mindfulness" (Bronson and Gangadean, 2010) as a key learning outcome. Since there would be little time to take students into the intricacies of linguistic research, I was challenged to distill this outcome into specific moments of learning that would connect with students where they were, while indicating the complexity that further study would elucidate. My effort centered on two areas: the construction of categories, and the genealogy and performance of gender identity in online and face-to-face discourse.

The discussion of categories emerged naturally from the first night's discussion as the students themselves provided the raw material. I wrote down the terms they used to describe their own sexual identities and then proceeded to ask how one knew what each category was. I relayed some basic research about our natural reliance on prototypes (Rosch, 1978) as more central members of each category, with more marginal members not activating the category as fully. I went on to point out the social and historical construction of the categories they used (Foucault, 1995). My colleague Shoshana was able to connect with the tradition of narrative psychology where clients reflect on the structural sources of the stories in which they are embedded as part of the healing process.

Our linguistic “fieldwork” was already described above in the “personal growth” section. Students had a first hand opportunity to journey to other corners of the sexual landscape and to report and reflect on what they found. They could connect this with articles and chapters on the language of personal ads, which had been widely studied. We also experimented with embodied language by asking students to walk around the room as though they were walking in various parts of the city, some more LGBTQ- friendly than others. Surprisingly (for some in the class), two young gay men reported that they actually felt less comfortable in the gay-friendly Castro District of San Francisco. They said that in that part of the exercise, they became aware of being on display as sexual commodities in a cutthroat marketplace full of judgments about their appearance and desirability. We used this to discuss Foucault’s (1995) development of the “Panopticon” as the internalized observer who embodied social control in the individual.

In the culminating exercise of the unit led by health educator Willie Wilkinson, students were asked to come up with interventions appropriate for diverse trans-clients who were struggling with substance abuse and other issues. Students had moved through an initial discussion of terms and stereotypes to the application of their newfound knowledge for an imperiled population. This cycle exemplified our original commitment to base our work in experience and to return to application and significance at the appropriate point in each unit.

The small lessons I would add to the burgeoning discourse on transdisciplinarity from this one case are these. True transdisciplinary work requires that departments and institutions actually recognize and reward cooperation across disciplines and departments. Since so many great ideas start in informal salon settings, more purposeful “intellectual matchmaking” (maybe starting with better food) could help such inquiry to become vital and central rather than marginal (as it is currently on most college campuses). So many of the great questions of our day require this kind of cooperation—students are not typically drawn to Philosophy 1A or Psychology 1A per se, but they do care about what it means to be human and what their work is in a collective response to a world in crisis—and so do many faculty.

Students’ inherent concern with the big questions should be amplified in the forge of transdisciplinary inquiry, ongoing among faculty on a healthy campus, and not dampened by departmental and disciplinary turf wars. This course holds some clues as to how this imperative can be realized as a matter of increasing, rather than decreasing intellectual rigor, while more responsibly preparing the next generation of scholars and practitioners to work in and with the disciplines as we have known them. Moreover, the image of the lone trans-disciplinary scholar or practitioner is an oxymoron in addition to being an archaic vestige of an earlier social, technological and economic era in higher education.

Social Relevance and Space for Difference

By now, my major points about the organization and aims of the course and how these were realized in practice have been made. Also, the numerous references to the same activities and materials in different sections indicate that there are many synergies across the dimensions that have organized this article thus far. Integral education in its most robust embodiments is not simply an exercise in self-development or of transcending disciplinary boundaries as a way of claiming new, albeit transdisciplinary turf. It shines when students are actually prepared to work professionally in areas of their choosing, to apply what they have learned to real-world concerns and people in the contemporary world. The translation into practice has been more straightforward for the clinical psychology programs at C.I.I.S.: the MFT (Marriage Family Therapist) Community Mental Health program is the most recent example of attempts to benefit underserved communities. Opportunities to connect integral perspectives with problems in the world are available to all students in the form or internships and service learning projects supported by work-study funds.

Nevertheless, this area that requires much greater emphasis, especially if the larger purpose of integral education is to remain relevant in a time of scarce resources in the academy. Integral theory per se has been developed extensively and entire academic programs have been devoted to it. But these are not sustainable without a built-in connection to larger communities and worlds outside the few who can take the time to devote years of study to a particular language and framework. The integral education movement must keep its eye on the prize if it is not to go the way of so many attempts to rethink education and become simply another footnote. If it is not preparing the next generation so that they are capable of doing more relevant work in multiple communities-of-practice, what good is it, anyway?

Attention to difference was built into every aspect of the language and sexuality course, although I would not yet hold it up as a model since it is still such a new course to me. The initial reviews from students were very positive. One said in a class evaluation: “Attention to these issues (difference) was woven seamlessly into the class.” The work with trans populations was mentioned as pivotal in de-centering students’ hetero-normative prototypes, widening their acceptance of variation and deepening their respect for sexual and gender diversity. The altar exercises and the numerous opportunities to de-brief, allowed students’ individual difference to emerge so that their stories became a source of insight for others. Owing to the climate of intimacy and complexity that evolved, differences could be explored respectfully without, for example, anyone being put on the spot or interrogated as the “token bisexual.”

Integral education in all its manifestations has been characterized by an attempt to widen the lens of what is acceptable as a way of knowing and learning. It requires unflinching and ongoing inquiry about self and world. In the contemporary world integral education must, like its cousin, integral theory, be critiqued as a relevant source of responses to the problems of our day, chief among them as a space for dialogue that respects difference and paradox as sources of new knowledge (Parry & Duran, 2009), rather than as a struggle for supremacy between competing views (see Puhakka, this issue). In this sense, the lens must be widened and the gaze extended to include not only a critical perspective on race, class, gender and other forms of difference, but the gazer herself (see Bronson & Fields, 2009b regarding “positionality” for a recent discussion).

Integral education must include an ongoing critique of access (who gets to be integral?) and its adherents' inevitable complicity in a post-colonial, racist, sexist and classist system. Otherwise, the movement will not achieve its promise as a source of relevant knowledge in a diverse and globalizing world. The problem of translating across cultures, nations, frames and viewpoints is certainly central in 21st century collective life. Integral education has its part to play as a source of interventions, but only if it mindfully accounts for how its ideas translate into practice in multiple and variegated settings (where difference in many forms is present).

Conclusion: Toward an Integral Praxis

As an educator of teachers at UC Davis, I often hear versions of the following: "That sounds great in theory,...but what am I going to do tomorrow?" This article has provided a few snapshots of what a class looks like that is designed to embody some key dimensions of integral education. I will close by making some preliminary suggestions about how integral educators might begin to assess their own and each others' practice in these dimensions. Without conceptual tools for assessment and some process for collective accountability, how will anyone know whether any particular class is effective as integral education? Without a framework for evaluation, how will we know that we are actually *doing* integral education rather than simply talking about it or "putting old mind in new bottles" (Bronson and Gangadean, 2010, p. 149)?

"Integral assessment" is a new frontier (Davis, 2010) that deserves much more attention than I can give to here. I do want to say that we can we assess what is essential in integral learning without putting it back into the same old boxes or limiting spontaneity unduly. Articulation of clear integral learning outcomes is basic if still challenging for most educators. We and our students need to know what we expect of them and how we will know they have achieved it. Assessment beyond this is complex enough in traditional settings. Moreover, it is a particularly tricky proposition where issues of personal growth and development are concerned, which needs much fuller exploration outside the scope of this essay. How does one decide if a student has adequately integrated personal and intellectual growth in an "assignment" or discussion, or is that even the right kind of question? At the very least, student work will need to be read by faculty from a different perspective if integral goals are in mind.

In another context, we offered the framework of *topic, approach, method, and intervention* (Bronson & Watson-Gegeo, 2008) as a means of sorting through various research programs and propose that the same be done with integral education. The idea is that there are at least these levels of embodiment for the dimensions, not that they are mutually exclusive categories in practice. At the most basic level, integral content can be included as a *topic* imply by being included on the reading list or being discussed in class. Thus, students might read transdisciplinary thinkers like Gebser or Wilber, but not actually go much deeper into the possibilities of the ideas in practice. Checklist approaches to integral education risk falling into the *topic* category inasmuch as they select an activity from each "quadrant" but do not attend to the integration of knowledge across modes or quadrants or the actual impact on learners (see Ferrer & Sherman, 2008; Bronson & Gangadean, 2010, 2006 for critiques).

Integral education as *approach* involves a purposeful interaction with the content or material that brings the ideas and dimensions alive and integrates deep and generative learning in students, regardless of the mode of delivery (Palmer, 2004). Even a great lecture can be truly integral in this sense, the emphasis on multiple ways of knowing notwithstanding. In the non-dogmatic view being presented here, what matters is the result. It is important not to fetishize the method per se—a method is no guarantee of educational success (as the track record of the fad-crazy educational industrial complex attests).

Approaches to disciplinary material can always be more or less trans-disciplinary in practice, leaving open multiple viewpoints and acknowledging the contributions of diverse scholars from other traditions outside the canon. Educators already engage difference with varying levels of concern and skill in the way they present any content or respond to students, even when they are not consciously choosing a particular curricular or pedagogical goal related to "diversity." Courses of study as lived experiences can be assessed in terms of the extent to which they actually evoke and "lean toward" the integral dimensions in the hidden as well as the formal curriculum.

As a *method* integral education may involve many explicit practices such as visualization, role play, working with materials, dialogue, personal reflective and scholarly writing, and field trips as discussed above. *Methods* represent particular pedagogical or other practices designed to generate deep, integral learning in students. They are part of the formal or informal curriculum and depend on the mindful embrace of the educator of the available palette of options appropriate for her setting and goals. Since so much of assessment is centered on the quick fix or next round of test results, the evaluation of the methods of integral education are especially complex and merit further study by scholars of teaching and learning.

Integral education as *intervention* can be evaluated in terms of how well it actually impacts the students and communities it is designed to serve. Thus, transdisciplinarity is valued in integral education not because it is in vogue, but because it is a responsible stance in a world where the old boundaries are being dissolved. Learning how to learn from differently positioned colleagues in work teams is much more important that knowing a fixed canon that will be outdated by the latest internet posting by the time the next article is printed. By assessing integral education efforts as *intervention*, one can highlight how well the desired shifts have been achieved and can do so in a setting of collaborative inquiry with the learners. In this, integral education finds common cause with educators everywhere who seek to create the deep learning and build the capacities that are required for the next generation to respond more artfully and humanely to the challenges they will face.

Conclusion: Trans-dancing under the Big Tent

As the new series by SUNY Press indicates (Esbjörn-Hargens, Reams, & Gunnlaugson, 2010 is the first)," integral education" is on the map as a potential force within the general rethinking of education now underway. A major challenge is to develop the theme from being something more than just a "big tent" concept (for disparate and even contradictory content and forms of pedagogy) into a practical program for a collective move to "higher" educational "ground" (Bronson and Watson-Gegeo, in press). As with so many grand projects, the proof lies in the details of practice, in the intimate step- by-step embodiments in multiple sites and settings that critical practitioners from many disciplines can review and learn from. I have offered this report in the spirit of clarifying some lessons from my own case and opening the way a bit for those who might follow.

We ended the workshop part of the class with the following vignette:

> The papers have all announced it, it is on the radio and t.v. and everyone has heard it and is in the streets because they believe it: All difference is now respected and all peoples emancipated. There will be no more institutional or collective discrimination. Everyone will have guaranteed health care, education, a safe and clean environment, healthy food and housing. All people are welcome everywhere and are safe and protected, regardless of whom they love…

The students then enacted role plays in which they showed their responses the moment they heard the news. We ended with a celebratory dance, a trans-dance, of psychologists, anthropologists and social scientists, lesbians and gay men, bisexuals, straights, and gender-queer to a compelling disco world beat. One of my students slipped a pink boa around my neck as we continued our now raucous dance—it holds a place of honor (right next to Tinky) in my office to this day. I already have my first piece for the next altar and, more importantly, the story and enduring hope that goes with it.

Becoming World Becoming:
Embodied Practice in Psychology and Education

Ian J. Grand[1]

Abstract: In the Integral philosophy of Sri Aurobindo and Haridas Chaudhuri, consciousness and knowing do not suffice. What is crucial is actual participation in the making of the world. Beyond transcendence, there is a creative emergence in historical time of new possibilities of being and becoming. When we meditate, or act in the world, or engage in other kinds of spiritual practices, we directly, concretely, change the ground of our being. We are changed in our bodies and we are changed in our interactions in the world. There is a creative spiral: changes in breath, changes in activity, become changes in consciousness. How we interact, do work, have feeling, changes us, as does our reflection upon them. The conditions, practices and tools of the historical era in which we live shape us as we shape them. What becomes important in practice is to learn tools and perspectives that expand our ability to participate in the making of the world.

Keywords: Creative, emergence, integral, ontology, spiritual practice, somatic psychology, world becoming.

Introduction

What is intriguing to me about the integral philosophy of Sri Aurobindo and Haridas Chaudhuri is that in it, being *becomes*. Birthings, histories and multiple realizations in time matter. For both Aurobindo and Chaudhuri there is an image of World Spirit becoming. Identification with the creative is central to their practice.

In this philosophy, consciousness and knowing do not suffice. What is crucial is participation and presence. We come to realize ourselves as world becoming itself as we participate in the multiple, intersecting, and radiating worlds with which we create and manifest realities. This world making is central to the integral enterprise; and it is this aspect of integral thought that I will develop here.

I begin by turning to language from Haridas Chaudhuri, founder of CIIS, who came to San Francisco from India after a request by several local scholars to the Aurobindo Ashram to send a teacher of integral philosophy and yoga. In his book *The Evolution of Integral Consciousness* Chaudhuri (1977) notes:

---

[1] **Ian J. Grand**, Ph.D. is Professor in the Somatic Psychology Program at the California Institute of Integral Studies in San Francisco, California. He is co-director of the Center for the Study of the Body in Psychotherapy at CIIS where he is involved in a wide range of research projects. He was Editor of the journal *The Journal of Biological Experience:* Studies in the life of the Body and co-editor of the book *The Body in Psychotherapy*. He has written several books including *A Beginner's Palette of Somatic Practice* and numerous articles.

SOME RIGHTS RESERVED

> An individual may experience the joy of boundless self-expansion by realizing his oneness with the cosmic whole, but transcendence must be further transcended. For wholeness of being one must appreciate the unique value of his individuality as a creative spark, as a set of dynamic potentials to be actualized for the good of society. (p. 64)

"Transcendence itself must be transcended" means that there is real work to be done in time and space, in the immanent becoming of the world. Aurobindo, it will be remembered, was initially involved in the Indian liberation movement.

In this there is, as Chaudhuri notes in other places, the work of both the conscious and the unconscious aspects of our experience. There is the often-chaotic clash of disparate and contradictory elements as well as transcendent calm.

When we meditate, or act in the world, or engage in other kinds of spiritual practices, we directly, concretely, change the ground of our being. We are changed in the flesh and energetic and fluid substance that we are.

There is a creative spiral. Changes in breath, changes in activity, become changes in consciousness. How we interact, do work, have feeling, changes us, as does our reflection upon them. According to Chaudhuri (1977),

> When we understand this, another thing follows. Another feature of creative meditation is what I may call transformation. If your goal is dynamic union with Being in the sphere of human relations and social transactions, then your entire being becomes very precious. Your body, your sense, your 'I-sense', even the unconscious impulses, instinctual drives. All these become important. They are the means of action. (p. 123)

Our craft becomes the working of a triad of function that includes consciousness, the unconscious, and practice in the world in which world spirit becomes manifest in its cosmic play. The making of the world is an art in which there is a continual round of being/practice/knowing/becoming.

As Mauro Ceruti (2008) notes with regard to the philosophies of Charles Hartshorne and Freeman Dyson, "…what unifies cosmologies of this type is an ontological reversal; the only possible "essence" of the universe is its history, in its entirety (including its stases, discontinuities, forms, and processes)" (p. 56).

The world is moving and I am moving. We constantly change, and change each other. I meet particular people and am immersed in specific milieus. I create myself daily in my organizations of self and in my responses to the stimulations and attractions of the surround around me. I absorb and practice or resist and refuse the gestures and tones and ideas of the people and media images I encounter.

The conditions, practices and tools of the historical era in which we live also shape us. Each epoch has kinds of work and means of travel, specific ways to find out about and interact with the world. In our contemporary world, we can in short order go to Rome or India or go to the

Internet to find out about Pliny or Aeschylus or D.J. Spooky or Rapso. My fate is intertwined with the people of Iraq and Egypt and North Korea, the possibilities for speech or action or privacy negotiated continually in changing sets of ideas and feelings, fears and aspirations.

As I write this, we have just witnessed the change of regime in Egypt. Tweet by tweet, email by email, television coverage and massings of people in the street organizing themselves changing with the changing situation.

I am not the same me and you are not the same you as when we last talked or since our last sentence. This is not a trivial matter.

Integral Education and Therapy

I now turn to some images of how we might incorporate, literally, this integral perspective in education and therapy. What might a psychology based on what we are talking about look like? How might it describe the difficulties of people and sketch means for changed engagement with self, other, and the world? What educational means would be important to foster imagination, creativity, and participation in the creative emergence in the world? What tools can be given that would be useful to this daily practice of self and world becoming.

In an integral Psychology as outlined here one might first come to valorize all aspects of one's experience and explore their meanings experientially. In several passages in *The Evolution of Integral Consciousness* Chaudhuri (1977) follows this line in suggesting that body, psyche, emotion, interaction, and the formation of institutional practice are all sites of integral practice:

> ...the physical, the instinctual and the mental are no less important components of the total self than the spiritual and the transcendental. Transcendental consciousness may be more fundamental, more luminous, more revelatory of the structure of reality, but it certainly is not the only reality or the only value that counts. Physical consciousness or body awareness, instinctual drives, reason, and the I-sense (i.e., the sense of individuality), freedom of choice, participation in the creativity of life, etc., are equally real constituents of the total self. There can be no perfect self-realization without the actualization of the physical, emotional, intellectual, social and spiritual potentialities of man[kind]. (p. 62)

He goes on to say that "The methodology of integral psychology can best be described as integral experientialism" (p. 70). He elaborates what he means in another set of statements.

> Integral experientialism is therefore a blueprint for thorough investigation of all forms and phases of human experience. It includes in its scope dream experiences as well as waking experiences, drug-induced hallucinatory experiences as well as meditatively acquired ontological insights, dreamless sleep experience as well as transcendental experiences. (p. 71)

> Integral psychology is based upon experiences and insights affirming the multi-dimensional richness and indivisible wholeness of the human personality. It is founded

> upon the concept of man's total self as the integral unity of uniqueness, relatedness, and transcendence, as the indivisible unity of the experiential and the transcendental. (p. 58)

Integral practice here does not mean striving for a consciousness that excludes not knowing, confusion, difficulty, and the creative, and problematic, workings of the unconscious. There is a creative magma of living experience in which we embody together with other bodies a polylectic of qualities, shapes, meanings and outpourings. We create embodied textures and contours of experience and the possibility of experience. Ideas, images, sounds are tools then for our embodied becoming. Architecture, music, modes of work, and beliefs all shape us and create the experience of our ongoing humanity.

In *Modes of Thought*, Alfred North Whitehead (1938/1958) writes:

> There is no reason to hold that confusion is less fundamental than order. Our task is to evolve a general concept that allows room for both… My suggestion is that we start from the notion of two aspects of the Universe. It includes a factor of unity, involving in its essence the connexity [sic] of things, unity of purpose, and unity of enjoyment. …There is also equally fundamental in the Universe, a factor of multiplicity. There are many actualities, each with its own experience, enjoying individually, and yet requiring each other. (p. 70)

The Caribbean notions of “I and I” and “All of We is one” echoes this double vision. “I and I” is a Rastafarian name of Jah, the Supreme Deity. It is a place of two subjectivities coming together. “All of We is One,” a phrase from C.L.R. James’ novel Minty Alley (1997) points to the connected aspect of Universe that Whitehead talks about.

This leads to a couple of other grounds for an integral psychology and education. First, Aurobindo and Chaudhuri both valorized the social, the political, the sense of Institutions and Institutional change. They were concerned with the cultural and cultural variation in experience seeing this diversity as crucial in world becoming. Through cultural exchange the enrichment of creative tools occurs. Chaudhuri (1977) says:

> We are living in the twentieth century and we are citizens of the world. It is for us to be able to draw on the limitless wisdom of east and West and North and South. That is the great privilege of modern man. The cultural heritage of the entire human race is open to him. Wherever there is truth, wherever there is wisdom, we can freely draw upon it and bring it together in a grand synthesis. (p. 43)

Chaudhuri (1977, p. 84) also suggests that there is a need for a global education that would include the following points:

1. Promotion of intercultural, interracial, and interreligious understanding;
2. Acceptance of ideological diversity within the global unity of humankind;
3. Affirmation of the intrinsic dignity of all individuals, men and women, everywhere in the world;
4. The essential equality of all races, and peoples, and nations of the world;

5. Interdisciplinary coordination and synthesis;
6. Education for the whole person in his/her multidimensional richness;
7. Comparative studies East and West;
8. Physical fitness and sports;
9. Opportunity for esthetic refinement and creative self expression.

In a possible integral psychology and education, then, it could be recognized that the primary difficulties from which we suffer are:

- Our inability to be part of the process of creative emergence; our getting stuck in old patterns;
- our inability to navigate between and with inner and outer realities;
- our devaluations of aspects of our experience, our desire, and our meaning–making;
- our fixations of self enactment, alone and with others;
- our inability to form patterns of embodied self-reflection; our snarly responses to individual, cultural difference;
- our lack of training in creativity, both personal, interactive, and social; and
- our devaluation of life, body, vitality in ourselves, others, and the world itself.

From these, images of practice flow: We need practice in loving and compassion as well as in the abilities to think and feel and act in multiple ways. We need practice in collaboration and collective action, practice in the plowing and seeding and production of the imagination. We need practice in reflecting upon our living, enacted values. So the means of promoting integral transformation both individual and cultural would be developing psychological and educational practices that directly give tools by which to address all these concerns.

Similarly, Montuori (2005) notes six kinds of learning that are crucial in this epoch: education for pluralism; education for complexity; education for media literacy and the psychology of mass manipulation; education toward co-existence; education that addresses the whole person in terms of reason, emotion, and the capacity for self-deception; education for creativity.

What is common here, and crucial, is that we shape education practices that enable us to better participate in the shaping of the world.

Body

And the forces of speech give way to the language beyond speech — Robert Duncan

As a Professor of Somatic Psychology I, of course, think that the cultivation of bodily approaches to meaning making is a crucial ground of integral psychology and education. For me, the insistence on continually naming experience ‘body’ is a way of giving emphasis to the role of the immediately felt and lived aspects of our totality. In this regard I have adopted for many years what I have called a methodological monist position that holds for a multiplicity of bodily experiences. It is ‘methodological’ in the sense that it is provisional.

In this view dreaming, thinking, sensing, passion, loving, and feeling are all part of a differentiated unity that we are. They can all be experienced as embodied. By emphasizing body, by experiencing the embodied qualities by which we construct our realities, we can come to use what we call bodily experience in an artful way. Our participation in the world changes when we ground our experience in the actual, experienced occasions of our breath, our movements, our rhythms, and our feeling.

Integral practice is practice of body whether body be considered breath or brain, movement or mantra. Becoming is the goal (a goal without an end) and conceptual knowing is station on the way. There is a continual round of knowing/becoming always embodied always imbued with that which is larger than the localization we call us but contained within it as us, as it, as well.

Whatever we practice bodily we become. In an article entitled "*Increased Cortical Representation of the fingers of the left hand in string players*", Ebert et. al. (1995) demonstrated that violin practice changed brain representations of violinists' fingers. These players use the fingers of the left hand to change the tones of the strings they are playing. The area of the motor cortex devoted to these fingers was up to five times larger in violinists that non-violinists. Through use there was a structural change in an area of the brain. Similarly, of course, yoga, weight lifting, and martial arts change tissue state, hormonal function and neural structure.

In psychology and education we can learn about how to explore what we have become as body in action in the world. We practice and become kinds of emotional bodies, feeling bodies, acting and moving bodies. We make meaning of loving, of feeling, of music and dance as bodies becoming. We enact ways of being together and being alone, create values of affect and sexuality, kinds of work and kinds of play—all bodily.

From a somatic psychology point of view, we can look at how various aspects of the psyche talked about in say, drive theory, or object relations theory, or relational, Jungian, and transpersonal approaches, can be experienced in their bodily manifestations. We see that the organization of self, and self-with-other, occur through bodily means. We look at how culture and social institutions value, encourage, and reward or punish particular forms of embodied expression, and certain strivings for embodied meaning. We hold that the lived body is both symbol of the past and the making of the future. It is the place where values and meanings are lived.

Chaudhuri (1977) says:

> An insight of modern psychology as well as ancient sages is that we are in for trouble if we set up a civil war between the different aspects of our nature. The intelligent thing to do is get to know our own nature—the basic drives, motivations, and fundamental impulses—and have a program of organized fulfillment of them. (p. 117)

In somatic psychology we explore all this and explore it by looking at how it is organized bodily. In doing this we look at the histories of emotion making in the family as the negotiation and creation of shapes of initiation and response. We each get angry, feel loving, feel nothing even through bodily means. As you are reading this text, you can begin to explore literally how you are doing the listening and from that develop a history of your coming to pay attention in this particular way.

In the clinical work I practice, we look at our embodied past and how we live it currently. I also look at how we can begin to make new worlds, leave old habits behind, and make new possibilities. One practice that I use in teaching psychotherapy praxis is called “body-felt reflection.” In this practice we feel how we have come to enact various values, interactions, interchanges. We literally explore the way breath, movement, tissue state have been and are continuing to be shaped in the moment. We look at, and name the values we have embodied as we feel how we are doing them.

The hope of this practice is learning both what we have done so we can alter it and finding ways to begin the liberation processes by which we can both explore and change what we have done. We can learn here to return to the process of self and other creation and find how we make meaning and values in the practice of the flesh. We can here include the learning from various psychodynamic understandings of the unconscious, cognitive understandings, and spiritual learning about the organization of aspects of consciousness.

We use the means of body-felt reflection to explore how we have structured ourselves in the past and to begin to discern the creative practices we have practiced all our lives in the making and co-creating of the human world. We can also practice new ways of being with others or our selves in our movements, gestures, feelings and expressions. It is like being in art school. Here it is the art of embodied living that is being practiced. Qualities of self-becoming and becoming-with-others are practiced. We use language, poetry song, movement, and mantra. We dream and use our dreams to create the ground of dreaming.

In the education of future therapists in the Somatic Psychology program at CIIS, these same means are used to ground students in their experience of themselves. The idea of art school is even more applicable. Students learn to work the ground of their own being so that they are enabled to be with another or others in practiced and help them come to deep embodied exploration as well. They do embodied dream work, embodied work with representations from the past, work with the embodied creation of new possibility in movement, breath, and emotional interactive range. Theory becomes practice and practice, theory. They learn to sit with, feel, and be compassionate toward the pain, conflict, and ecstasy of human life.

Our experiential work becomes guide and question. What are we doing and how is it being done? What kinds of humanity are we creating in our practice and in what we encourage in our clinical and social practices? What kinds of emotional, interpersonal, creative practices are we encouraging in our clients and why are we encouraging them?

And finally, we teach that the body is the place of creation, of the making of humanity, of the enactment of actual lived values. It is here that the franticness or ease of daily life is practiced, here that the actual qualities of loving, creation, and world becoming are lived.

Creative Emergence

In a collection of papers published by Haridas Chaudhuri and Frederick Spiegelberg (1960) titled *The Integral Philosophy of Sri Aurobindo: A Commemorative Symposium*, N.A. Nikam wrote a now obscure paper “The Problem of Creation: Concepts of Maya and Lila in Sri Aurobindo.” Nikam says: “It is the merit of Sri Aurobindo's philosophy to treat the problem of 'creation' as a problem of the *nature* of existence. Why is there ‘creation’? is a question which is a question about: *what* is the nature of reality, of existence?” (Nikam, 1960, p. 143).

In this Nikam seems to echo the question Heidegger and others raised: “Why is there anything at all rather than nothing?” (Heidegger, 1961, p. 1). But Nikam, from an integral perspective, shifts the question.

> In Sri Aurobindo's treatment of the problem there are two points to be noted: a) Why the Infinite becomes the finite is a wrong question because we do not understand the true meaning of the word “infinite.” The Infinite is that in which “all possibilities are inherent in its Infinity,” as Sri Aurobindo says, and so, the “delight” of its existence “lies precisely in the variable realization of its possibilities.” b) The variable realization of its possibilities is a movement in which the Infinite “looses” itself as Sri Aurobindo says, by “concealment” in that which seems to be its opposite; so in another sense, "creation” is a process of evolution in which the absoluteness of conscious existence, or Saccidanada, has to “emerge.” All creation or Becoming is nothing but this self-manifestation. (Nikam, 1960, p. 146)

He goes on to say that:

> …the world, according to Sri Aurobindo, is not *maya* but *lila*: i.e., a play, a and joy of play, wherever this is found: “the child's joy, the poet's joy, the actor's joy, the mechanician's joy…;” the cause and purpose of play is: being ever busy with its own innumerable self-representations. When the discovery of self-delight of being is really made—this is possible for everyone—then we have mastered the great art of living. (p. 147)

In the integral practice Chaudhuri outlines, we align ourselves with the creative aspect of World Spirit becoming. We live from, act toward a creative emergence in which valorization, meaning, and, above all, delight in world play continually manifest. We come to know ourselves as World Spirit in its imaginal becomings. We create, in history, social worlds, material worlds, and even the natural worlds as well.

In our practice we can come to identify with the creative outflow into the world: the making of world becoming. It is like the prescription in the alchemical treatise *The Emerald Tablet of Hermes Trismegistus*:

> Separate the earth from the fire, the subtle from the gross,
> It ascends from the earth to the heaven, and again descends to the earth,
> And thereby gathers the strength of all things above, and of

> All things below,
> Thus was the world created and
> Hence shall wonderful adaptations be achieved, of which the means is here.
> (quoted in Smith, 1997, p. 7)

In the alchemical work described in the Emerald Tablet there is a rising up, a separation of Spirit and Matter, and a being born again. This is followed by a descent back into the world, a third birth in which Spirit and Matter are again seen and experienced as whole and creatively potent. We then, as it is said, hold the power of all things.

In another alchemical text, *Atalanta Fugiens*, written by Michael Maier (1617/1989), there are pictures, epigrams, and poems that indicate aspects of the alchemical process. One image shows the Philosopher's stone as existing everywhere to be developed. Others show the process of pain, dissolution, and joy accompanying the work of making the world.

Chaudhuri says:

> The imperative of life is to focus on the living present, to concentrate on a reasonable span in the present life with all its challenges and opportunities, with all its glories and frustrations, with all its rights and responsibilities, with all its dark nights of despair and bright days of creative achievement. Active participation in the living present creatively advances into a glorious future. (Chaudhuri, 1977, p. 58)

Aurobindo's integral vision was born in the struggle to go past colonialism, past the split between the spiritual and the material, and past varying traditional senses of self. It de-centers the self and the other and inherited histories as well. Integral practice includes working with the sick and the poor, working with the dispossessed, working in history toward change. It is ongoing manifestation and creation in immediate and transcendent presence.

We practice embodied manifestations. I think here of the Jewish Kabbalist Abraham Abulafia (1976) whose practice was the combination of the names of God. In integral practice each thing of the world, as in the alchemical image from Atalanta Fugiens talked about earlier, comes to be seen in its divine manifestation. These multifarious manifestations are combined in embodied thought, practice, art, and interactions with others. In this creative dance we join with, become, world becoming.

I end here with several lines from the poet Robert Duncan:

> First there is the power; and in the power
> Is the tone or tune,
> So that all of creation moves with a music;
> the sound having its open doors in the mind;
> but in the heart lieth its fountain.
> (Duncan, 1977, p. 127)

Daring to Step into the Open: Moving Beyond Perspectives in Education and Life

Kaisa Puhakka[1]

Abstract: Evolution in all spheres—cosmos, culture, and consciousness—is explored as a dynamic, creative process of shifting and settling, where shifting breaks out of existing structures and conceptual moorings and settling solidifies the movement of evolution into structures. Both are seen as essential aspects of the evolutionary process, but a bias for settling is noted among living creatures. For humans in particular, shifting arouses anxiety whereas settling promises security. The correction of this bias in the educational process to help realign human consciousness and culture with the rest of nature and cosmos is explored. Such a realignment may be necessary for meeting the unprecedented challenges of our world today, and an open, perspective-free inquiry can serve as a vehicle for it. But this inquiry calls for a new way of relating to the inherent uncertainty of shifting and to the anxiety this arouses in teachers and students alike.

Keywords: Absolutism, awareness, constructivism, consciousness, cosmos, courage, creative, dialectical, education, epistemology, evolution, heart, inquiry, nature, perspective, pluralism, settling, shifting, Shiva.

Introduction

During my first year in college as a foreign student from Europe, I was told by my American fellow students that they had dissected frogs to learn anatomy in high school. Some of them even caught and killed the frogs themselves (the latter claim may have been inspired by the horrified look on my face and was probably not true). I found such learning practices utterly amazing; nothing like that had been part of my high school education. We had read anatomy text books, painstakingly absorbing a lot of detailed information about bones and muscles and such.

Later, I came to appreciate that the difference between the European and American educational approaches went much deeper: In Europe, education had much to do with passing on the accumulated knowledge and wisdom of tradition as this had flowered in the arts and the sciences and the cultural practices of civilization (which in the early sixties still largely meant Western, Greek and Latin based culture, though signs of nascent interest in Nonwestern cultures were starting to be there). In the U.S., by contrast, the emphasis was not on transmission of culture and tradition as much as it was on personal experience and individual discovery.

Both approaches seemed to have their own problems: European students seemed to be passive recipients of a stagnant tradition. American students seemed to be re-inventing the wheel over and over again. But it was not as simple as that. To be sure, critique of tradition and established knowledge was not part of the European high school education I had been exposed to. Yet we did criticize, under our breaths, outside the classroom, and later in all sorts of anarchist and other radical political movements. And we had learned well and knew the depths and details of what we were criticizing.

On the other hand, in the U.S. I listened to my fellow college students readily questioning and criticizing, which, I discovered, they were expected to do—it was even part of the formula for writing term papers. And the yardstick for their criticisms was mostly their own personal experience. But they seemed less knowledgeable about what it was they were criticizing, and their critiques often rang shallow to my ears.

Another thing that struck me as strange about my American fellow students was that most were voting Democrat or Republican simply because their parents were. My parents rarely agreed on which political candidate to vote for, and there were lively and often heated discussions preceding elections at home. I drew the youthfully sweeping conclusion that American students' critique conformed to, rather than seriously questioned, the establishment they were criticizing—until I got swept up in the counterculture which was gaining momentum in those years, and I felt the power of real criticism swell within the ranks of my fellow students such as I had not seen in my lifetime.

I was observing a fundamental dynamic of consciousness at work in two different cultural and educational settings. Same dynamic, taking different twists and turns in each case. The words “shifting” and “settling” later came to mind (other words like “in-breathing” and “out-breathing,” “contracting” and “expanding” also came) to describe the two poles of a dialectical tension that propelled this dynamic. In shifting, consciousness sheds its moorings and moves out but is also pulled to find a place to settle in, an anchor to hang onto whether in the form of a belief about what's real or what's good, or a goal to be accomplished, a product built. Even the ideas of change and growth, which the above sketch of the American educational vision emphasizes, can, and eventually do, become part of the settling of that vision. And yet never for long: once safe and settled in a resting place provided by tradition, ideas, and approaches, consciousness sooner or later tears loose from its resting place to shift again.

Is this shifting and settling something that can be shaped by cultural or educational influences? It seems to me that the forms of settling indeed can, but the dialectical movement of consciousness itself cannot. For this reason, no individual accomplishment, no cultural or educational practice can ever be the last word on the evolutionary process. Indeed, those educational, artistic, or other creative endeavors that do not purport to capture this process in theory or description but to actively participate in it find themselves constantly examining their existing practices and exploring new horizons. This is certainly true of educational institutions like the California institute of Integral Studies (CIIS), which endeavors to bring its practice of integral education into resonance with the nature of consciousness and of culture and cosmos at large. The envisioning and implementing of what CIIS does is a process always in the making, never complete. And this is as it should be.

Even so, it is not easy. In particular, the aspect of the evolutionary process I refer to as “shifting” is not easy. As academics and educators, shifting tends to unravel our achievements, unsettle us just when we thought we “got it” and perhaps even staked our reputation on an article about it in print. So how do we align ourselves with, not just describe or theorize about, the evolutionary process that moves in and through us and the rest of the universe? This question is at the heart of education which strives to be truly integral.

In this article I invite my reader to take a look at how the evolutionary movement can get stuck in the forms of settling prevalent in our culture, consciousness, and education, and how it can get unstuck from these. Constructivism and pluralism are the favored forms into which liberal culture and education have settled—and in which we appear to be stuck—today. An inquiry which is prior to, and goes into, any foundational epistemological stand we might adopt is called for to get us unstuck. In the last sections, we will explore such a perspective-free inquiry and how it can function as vehicle for a genuinely transformative education which aligns us with the evolutionary shifts in the making.

Images of Evolution

There is an image of evolution inspired by the shifting and settling movement of consciousness. This image comes from Hindu mythology and is embodied in a small bronze statue depicting Shiva Natarajan, the four-armed God who dances the cosmos into existence moment by moment. It is a spontaneous dance which creates its steps as it goes, without forethought, without plan. The absence of plan or forethought underscores the creativity of the process. One can imagine Shiva's feet shifting and settling in unexpected ways, creating all the forms of the manifest world—and the creation is still going on, we are reminded. This image calls attention to what is missed in the Darwinist vision of evolution in which there is a plan—at least a direction—which moves from primitive to advanced, from simple to complex. The direction is supposed to be toward better (the “fittest” who survives), if not bigger things, materially and spiritually.

The Darwinist belief that there will be something better just around the corner can be comforting in challenging times, yet it takes attention away from the present where, Shiva suggests, creation and change happen. I once asked my mentor from India, why does Shiva dance? He replied, “for no reason, just for the sheer hell of it,” meaning that Shiva dances simply because he can. Life is inherently creative, which means that creation is an end in itself, not a means to realizing some other end via a pre-existing plan. Nature proliferates forms as much as she can “get away with.” What an exalted, joyous, life-affirming understanding of nature and cosmos!

Yes, but unsettling as well. For no preference or ontological priority is given to settling over shifting in this dance. Forms of life and consciousness appear—and disappear just as readily. There is no foundation already in place before the dance commences; all foundations are created and destroyed in the dance itself. Shiva seems to gently mock one of the most basic of human aspirations, which is to settle into something permanent, something that gives us lasting comfort and security.

The painful irony of our times is that, just when that prosperity and lasting security would seem within reach for the globalized economy of our technologically advanced world, the ephemeral and illusory nature of such security is most apparent. There is no foundation before one is created by an act of settling, and there really is nothing more to the foundation than the act that creates it. This is what Shiva's dance conveys about the cosmos at large and about consciousness itself, and this is what our postmodern world enacts in its forms of culture, arts, and politics.

The task for education today is to prepare students to live and enhance the lives of others in a world without foundations. It would seem to me that an educational practice fully aligned with Shiva’s dance in the three spheres—cosmos, culture, and consciousness— is required to do the job.

A vision which encompasses all three informs the educational practices at CIIS. It was inspired by Sri Aurobindo and first implemented by Haridas Chauduri in the 1960's. Both were inspired by their heritage of Indian spirituality as well as their exposure to Darwin's evolutionary theory. The original focus on the Indian subcontinent has since expanded to include spiritual and cultural practices from across the globe. Similarly, the methods of inquiry have expanded beyond those provided by science to include other ways of knowing. The thread that connects the current vision and practice at CIIS to the original vision is the quest for connectedness in all spheres of life pursued by rigorous inquiry (Bronson & Gangadean, 2006; Wexler, 2005).

Darwin's theory has had a profound influence on educational philosophy and practice in America. The complementary view of evolution as entirely creative, captured in Shiva's dance has remained in the shadows, though some contemporary biologists have offered a fascinating scientific version of it (Maturana & Varela, 1987; Varela, Thompson, & Rosch, 1991). Now may be an opportune moment to bring it out of the shadows and let it guide our contemporary educational practices.

In the view of evolution captured by Shiva's dance, settling and shifting are both integral to the evolutionary process, and neither is better or more fundamental than the other. The same dynamic of settling and shifting is present in human consciousness as is in nature and the cosmos at large. Nature settles by stabilizing and solidifying its forms of life, just as cultures settle by building and securing their institutions, and individuals settle by formulating and adhering to their values, beliefs and positions. And in all three spheres, upheavals and shifts great and small, occur often unexpectedly and bring disintegration and renewal in their wake.

The Pluralistic Cocoon

Pluralism and constructivism provide the foundational beliefs for integral thought in education today (e.g., Palmer, 2009; Palmer, Zajonc, Schribner, & Nepo, 2010). At CIIS as well, the educational practices promote multiple perspectives and dialogue among diverse values and beliefs. Students are encouraged to become aware of their own perspectives and to engage those of others in a constructive dialogue. They are also encouraged to expand their perspectives to become more inclusive of other perspectives and to think in “both/and” rather than “either/or” terms.

The underlying premise of pluralism and constructivism is the belief that all truths and knowings are relative to perspectives and that we cannot but come from some perspective or other. But this belief is seldom itself subjected to serious inquiry, and even with thoughtful proposals to mitigate the looming danger of crass relativism available in the literature; for example, that our subjective perspectives and the world beyond these have a participatory relationship (Ferrer, 2002), most educators remain convinced that all knowing and inquiry are bound to and hence relative to some perspective or other.

We are not accustomed to thinking of pluralism or multi-perspectivism as being rigid or extreme. Yet they are, in their own way which is different from the rigidity of fundamentalists and others who endorse extreme and absolutist positions in religion or politics. The rigidity of pluralists is evident in their difficulty speaking with clarity and conviction because they believe that anything they say must be qualified by “it's just one perspective among many.” It is also evident in their belief that ultimately, there is no distinction between truth and opinion (and what counts as “informed” opinion is endlessly debatable) and therefore, their truths are really just opinions—a conclusion fundamentalists today happily accept and turn around to their own advantage, for the latter have no doubt that their own opinions are “the truth.” Nothing one can say from a pluralistic standpoint seems effective in opening up the dialogue past this point.

The constructivist belief that we cannot touch the world directly but are always ensconced in some perspective or other, if carried to its logical conclusion, lands one in nihilism. Some flee from there back to absolutism, and I suspect the fear of nihilism may fuel the rising fundamentalist trends today. But I suspect it is this same threat which keeps the liberal pluralists in a juggling act on the edge of the nihilistic abyss, appreciating all positions (more or less) equally rather than subjecting any of them to a thorough scrutiny for fear of falling into the abyss. Absolutists have their “solutions” which shield them from the prospect of nihilism. But pluralism and constructivism fail to offer a viable alternative to the absolutism in our social and political life today, and this is because they have become absolutists in their own beliefs.

The notion that pluralists are “absolutists” in their own beliefs may be hard to swallow for those who not only acknowledge but celebrate diversity of viewpoints and places of settling. But the paucity of substantial dialogue across the great divides in our society today speaks to both sides being locked into their respective positions. In our liberal-leaning educational institutions we find ourselves surrounded by people whose beliefs and values, at least regarding pluralism and diversity, tend to agree with our own. We all like to explore different viewpoints and engage in discovering new ones. But were we to step back from this for a moment, we might wonder whether this is just stirring the same old pot.

The viewpoints may be new, but they are still just viewpoints. Within the cocoon established by this belief, it is safe and self-affirming to exchange viewpoints. Thus like absolutists of fundamentalist persuasions who live in their own cocoons, we find ourselves settling not only into our shared beliefs and values but also into a social comfort-zone of like-minded folks. As educators, we should wonder every day how much our institution is a crucible for evolutionary change and transformation and how much it is a cocoon in which we abide safe and affirmed. In nature, all cocoons are meant to burst. If they don't, the life in them decays and dies. If our educational communities are to become relevant and potent contributors to the social and political process, they need to break out of their cocoons to once again move with the natural dynamism of shifting and settling.

Settling, Shifting, and the Pro-Settling Bias

Let us now take a closer look at settling and shifting, their interplay in nature and in our own consciousness. This helps us appreciate the enormous challenge for an integral education which envisions itself a participant in this play.

Turning to settling first: One moment we listen with an open heart and open mind. We feel resonance with what is being said and in the next moment exclaim, “Yes, that's true!” A position, a belief is being formed and affirmed. With this, we feel affirmed in who we feel we are. This is settling. We now have a point of reference for making sense of our world and of ourselves, and anchoring ourselves in it, we feel safe and secure.

As a dynamic activity, settling resists shifting. It not only freezes life and consciousness into forms but tends to reinforce and seek their confirmation from experience and from agreements with like-minded folks. With my of points of reference in place, listening half-heartedly, absent-mindedly seems enough, because I already know what is being said and agree with it and feel safe and affirmed in hearing it. With the freezing of life and consciousness into beliefs and positions, genuine learning comes to a halt. The evolutionary movement comes to a halt. To be sure, we can still tinker with our positions, re-arrange them some, and accumulate them. For many people, this counts as learning. But we are cut off from the unknown, unchartered, not-yet-formed immediacy of life.

I now turn to shifting. Unlike our experiences of settling, shifting tends to be extremely subtle and short-lived. Most of us have experienced “unsettling” moments when something we had taken for granted turns out not so. It is as if the bottom gives way and the world as we know it falls apart. Such moments can feel unnerving, embarrassing, even frightening. No wonder we resist them, often with elaborate defenses. But they can also be amazingly enlivening and exhilarating. Recall the last time you had a real “aha!” moment, perhaps in a classroom, or in a therapy session, or just while taking a walk in a park. Not a lukewarm “yeah, I buy that” moment but one in which everything you had bought into until then suddenly fell apart. There you stood, naked, exposed to the elements—the “you” you had known blown to smithereens. Yet in that moment you were in contact with life itself, knowing nothing yet connected to all with pure awareness not mediated by any interpretations.

In the next moment, you became aware of something new, an “insight” which you could grasp hold of because it had found its place within what you had previously known. This is when that peculiar smile of recognition that goes with the “aha!” experience spread on your face.

Many people equate “insight” with what is being recognized. Yet by the time something is *re-cognized* settling has already taken place. Just before the recognition, shifting happened which shook and perhaps momentarily dissolved all anchors and reference points. There was literally “no-thing” there, which is why if you just dropped into that space of nothingness, those watching your face may have witnessed, for a fraction of a second perhaps, a slackened jaw and a vacant stare. Such a situation might indeed be radically unsettling and unnerving were it to last. But it usually does not, and in the next moment, recognition and settling took place. The smile spreading on your face may speak of unspeakable bliss you just experienced, or it may speak of the relief in finding your anchors and points of reference you now experience, or perhaps a little bit of both. You are now settled, but perhaps not quite the same way as before, for you had entered the spontaneous movement of evolution for just a moment.

Shifting is indeed subtle and fleeting. But this does not diminish its potentially profound effect which can, and sometimes does, change the course of history. The spontaneous movement of evolution loosens frozen positions and allows shifting. Shifting can wreak death and destruction, yet it brings forth tremendous aliveness, exhilaration, and bliss as well. Nature is full of examples of this, small and subtle, like the dissolving of the caterpillar in its cocoon or the dehiscence of a flower bud. Or they can be large and spectacular, like earth quakes or volcanic eruptions.

Nature and cosmos have no bias for settling over shifting. Everything that comes into the manifest universe eventually goes out, sometimes the coming and going is subtle and drawn out, other times an instantaneous, loud bang. As a dynamic process, settling and shifting are both happening everywhere all the time.

Even though nature has no bias for settling over shifting, all its creatures who are invested in their own survival and longevity do. All life forms manifest a pro-settling bias in their striving for survival, security, and comfort. It is important to appreciate this same bias at work in our innermost psyche as in the cultural practices and institutions of our civilization. Thus disintegration and death, however much part of nature, are an anathema to us. Civilization was to shield us from that, and for a long time in the Western world, civilization was built and celebrated as a human triumph over nature. Today, we are facing the prospect of disintegration and death along with the rest of nature—a prospect that more than anything else has helped us recognize that we are part of nature and subject to its dynamic of shifting and settling. Still, the bias against shifting and for settling lives on in our culture and it is what provides stability and continuity to society and its institutions.

In subtle but powerful ways, the pro-settling bias pervades our intellectual and psychological lives. Earlier, we examined this in terms of the foundational beliefs of pluralism. But not only do our intellectual beliefs manifest this bias; it is evident in all aspects of our personal, professional and institutional lives. We value (or feel pressure to prioritize) products over process, safety over vulnerability, security and control over openness. We think of ourselves as pragmatists who are open and flexible, yet our pragmatism inclines us to regard shifting as being at best a means by which the fruits of settling are achieved. Shifting is a threat to what we have and who we take ourselves to be, and so we have a strong tendency to cling to ideas or practices we have settled into—even ideas and practices designed to promote change, growth, and openness! In other words, we feel more secure and comfortable with a tried and true “method” or “approach” for change and growth than if we had to step into uncharted terrains without maps or methods and surrender to the unknown.

Today we face unprecedented threats to our collective survival as species of this earth. With “threats,” I am, of course, referring to things like climate change, overpopulation, depletion of and ever more desperate competition for resources, and a global economic engine that depends on further depletion of resources and growth of population. Our pro-settling bias has us clinging to beliefs and positions that ensure continuance of the path we are currently on even if it is headed for disaster, at best allowing for superficial changes and band-aid solutions that may provide short-term gratification psychologically but without changing humanity's course substantially.

Thus the very technological-scientific-capitalistic society we have built to ensure our survival and thriving and in which our educational institutions are embedded are now threatening our survival and thriving. Put differently, the pro-settling bias which has us protecting ourselves against shifting is pushing us toward a shift of unprecedented magnitude. Confronting and resolving this bias seems necessary for the survival of nature and human civilization as we know it. But this involves confronting and resolving the very insistence we have on survival which is at the root of our pro-settling bias!

This is the ultimate paradox of our predicament. It calls for nothing less than transcending of ourselves as a species and our settled beliefs and values. Only a radically transformative education can offer a meaningful response to this challenge. The idea that education transforms consciousness is not new, but the specific kind of transformation our contemporary predicament as outlined above calls for is new. This transformation takes us from self-awareness of perspectives and the appreciation of a diversity of perspectives to freedom from perspectives altogether. The idea of such freedom is not itself new. It was envisioned by Jean Gebser (1985) in his notion of “aperspectival consciousness” which is not only aware of its own and others' perspectives but which sees through them and is thus not bound by them. Wilber (1995), inspired by Gebser's vision, incorporated “aperspectival” consciousness in his developmental schema as a stage which initiates genuine spiritual development beyond the “egoic” stages.

I want to suggest that consciousness or awareness free of perspective need not remain an abstract concept in a developmental theory but can be actualized and developed in a process of inquiry which shifts from awareness of perspective to awareness free of perspective. That is, instead of immediately pulling back to its own “givens” or settling into another perspective or set of “givens,” consciousness shifts into openness and remains in a state of openness—not, of course forever, but at least a few moments longer than it would have before the shift. In a manner of speaking, it develops tolerance for true openness which is different from a state of suspension between alternative perspectives or of integration of multiple perspectives into a more inclusive perspective. The vehicle for such development is what I call “perspective free inquiry.”

Perspective-Free Inquiry

We must begin with the foundational belief of pluralism, namely that inquiry always depends on a perspective or belief. This belief, of course, denies the possibility of perspective-free inquiry, stalling it *on a priori* grounds before it even got started. Now is it possible to inquire into this foundational belief afresh, without prejudice or bias? Recognizing the belief as just that—a belief—frees up the movement of consciousness for inquiry. But just as important is to refrain from affirming the opposite belief, that inquiry is possible, lest the movement freezes again into an *a priori* stance.

A genuine inquiry begins with “not knowing” and proceeds in an openness which does not affirm or reject anything. So, we don't know whether perspective-free inquiry is possible. But we can inquire into it. This would be a reversal of the usual way we approach education: we bring inquiry from the background, the context of the particular content areas, into the foreground. In the usual way, primacy is given to the content areas and skills to be mastered, and inquiry is limited by the givens of the latter; whereas, when inquiry is the starting point and the very heart of the endeavor, it can be open and not limited by the assumptions of the contents and methods of an area of theory or research. It may be important to emphasize that I am not suggesting that acquiring knowledge competence or developing skills in research methods or therapy or teaching techniques is to be replaced by perspective-free inquiry, only that their order of epistemological priority be reversed. I am not the first to suggest such a reversal in education. For example, Montuori (2010, 2009, 2006) has called for it. There are interesting parallels and points of connection between his transdisciplinary inquiry and perspective-free inquiry as I am discussing here; for example, both transform the inquirer as the inquiry proceeds, and both are inherently creative. A full exploration of these parallels, however, must wait for another occasion.

Perspective-free inquiry is spontaneous and rigorous. Yet it has no agenda or objectives, and no end point or conclusion. In other words, it is not a method and it is not undertaken to get results. As noted earlier, we tend to feel more comfortable and affirmed in our professional identities with methods than with inquiry. For the latter is an undefined, open process which continually moves into the unknown and unravels the places of settling we cling to, including our methods.

This process, when engaged wholeheartedly and with complete attentiveness (Krishnamurti, 1969) fosters a mode of consciousness distinct from the perspectival consciousness involved thinking, whether conceptual, associative, or imaginal. Unlike the latter, which involve directional activity of the mind, the attentiveness in perspective-free inquiry is nondirectional or, rather, “all-directional” at once. It begins by moving into the “givens” of the situation—the various understandings and beliefs of the inquirer which, inevitably and often unconsciously, shape the inquiry and direct it, as if “from behind.” The inquiry thus proceeds backward as much as it proceeds forward, and it may spread out in all directions at once. Spaciousness is the distinctive quality of this mode of consciousness. It does not interpret or make meaning but renders transparent all meanings and interpretations and the perspectives from which they arise.

Such a spacious awareness is available to us, and we can dimly sense its presence in the horizon of consciousness as the space that holds and at the same time has the capacity to “see through” or make transparent the contents of consciousness. Usually, though, our attention is absorbed by the contents—the incessant stream of ideas, images, interpretations that fill up the space of our awareness. The power of this absorption puts us under a kind of a spell (Puhakka, 2003) which has us take the contents of our minds to be real and the awareness that holds and sees through them as unreal or nonexistent.

Both modes of consciousness, the mode of conceptual and imaginal thinking absorbed in its contents and the mode of spacious awareness that holds and sees through these, are recognized as sources of knowing In traditional Hindu and Buddhist spiritual psychologies. They are considered functions of the “lower mind” and of the “higher mind” respectively (Puligandla, 1975). The knowing function of spacious awareness is generally not recognized in Western mainstream psychology, though the beginnings of such a recognition are in evidence in the burgeoning research on mindfulness-based meditation practices which develop the capacity to “see” thoughts “as thoughts” rather than be absorbed in their contents, and to relax into a spacious, choice-less awareness. (Williams, et al. 2007; Kabat-Zinn, 1990). However, so far the research has been concerned with the mental health benefits of such practices, for example, in reducing anxiety, depression or the suffering from chronic pain. Such an agenda imposes a limit on the knowing function of spacious awareness, for the inquiry goes only as far as is required for its objectives (symptom reduction, increased comfort and sense of wellbeing) to be achieved.

However, there is no limit as to how far or deep the knowing function of spacious awareness can be developed by an open inquiry which has no pre-given objectives. Because it is not a method, it can be extended from the meditation cushion out into the world of ideas and knowledge and into the world of other people. It can be undertaken by oneself or with others, as David Bohm (1987) explored in his group. However, while I appreciate the spirit of Bohm's approach, to fashion the inquiry after any model, even his, runs the risk of settling around a formula that will stymie a truly open inquiry. Perspective-free inquiry can start by simply attending to what arises in the moment. When attention is alert yet not shaped by agenda or objective, it naturally expands and feels its way through the ”givens” of consciousness, my own and my partner's in the inquiry, as well as those embedded in the domains of knowledge we study.

An inquiry carried out in this way does not freeze into a “position” or viewpoint which might contradict or oppose another position, nor does it accommodate other viewpoints or positions in the way that larger positions accommodate smaller or narrower ones. Thus, it does not dominate or totalize. Clearly, perspective-free inquiry is integral, yet very different from approaches such as Wilber's (2001). It tends to open up positions large and small into spacious awareness that renders the positions transparent without accepting or rejecting them and without privileging one over the other. The spacious awareness within which it moves allows for a more intimate way of relating and communicating across differences, even the deep ones that now separate pluralists and absolutists. This spacious awareness—it should be clear by now—is not an over-arching meta-perspective. Rather, it is freedom from perspectives; and herein lies its potential for healing our fragmented world without reducing its myriad ways and colorful differences into a dreary blend of sameness.

I hope that it is clear from the exposition of perspective-free inquiry above that awareness of perspective is a necessary starting point for it. We can thus say that pluralism and its celebration of diversity help open the windows of our separate perspectival worlds into other such worlds. Perspective-free inquiry then takes the next step and calls us out of those worlds into a creative play in the spaces within and around them.

Confronting Existential Anxiety

There is a great yearning for connection and for healing our fragmented selves and relationships today. So why don't we just drop the beliefs and perspectives that divide us? We probably would, were it not for the great existential anxiety which the prospect of dropping all beliefs and perspectives and opening ourselves to the unknown stirs within us. Such anxiety is the power behind our pro-settling bias and resistance to shifting.

Anxiety tends to divert energy and attention to efforts to cope, and as long as safety and security are an issue, change and growth tend not to happen. As Winnicott (1974) said (I am paraphrasing here), when the needs for safety, security, and nurturance remain an ongoing concern, the person can at best maintain “mere sanity” but not manifest his or her full psychological health and creativity. The caterpillar's metamorphosis requires the safety of the cocoon, and we imagine that the caterpillar is spared of the need to give any of its energy or attention to maintaining that safety.

How to deal with anxiety is a challenge for education in general when development and growth are the objectives. But it is an exponentially greater challenge for the kind of inquiry and transformation we are exploring here. For the existential anxiety evoked by the prospect of having no beliefs and perspectives—therefore, knowing nothing, even being nothing—is such that no safety and security measures we as teachers or as students can take will spare the inquirer of having to face it.

So we must face it. Facing anxiety takes courage. We don't talk much about courage in education these days, perhaps because we tend to be more concerned with accommodating our students' safety and security needs. But great visionaries of integral education such as Parker Palmer (2009) talk about courage. It takes courage and integrity to discover something one can truly believe in and have passion about, which is what Palmer's “courage work”, is concerned with. He works within a pluralistic framework, however, and so talks about the courage to stand up for one's deepest beliefs and convictions.

It takes a different kind of courage to stand up without belief or conviction, wholly open and vulnerable, exposed to the unknown both within and without. It is important to not confuse this kind of standing up with refusal to affirm a belief or conviction or with joining in affirming whatever beliefs or convictions others may voice. These can be, and often are, ways in which we withdraw and fail to stand up, fail to manifest courage.

To stand up and enter into an inquiry without any protection such as beliefs and convictions provide takes great courage. This is courage of the heart. In contemporary spiritual discourse we talk of the heart as the seat of compassion, caring, and love. Yet it seems to me that courage is what gives depth and transformative power to these qualities. How do we foster courage which is not separate from compassion and love in our students? The answer, it seems to me, has much to do with how we as educators awaken it in ourselves and embody it in our work. There is no formula or method for training ourselves or our students in courage of the heart. But we can inquire into it. When undertaken without belief or perspective but with open attentiveness, such inquiry may be all that is needed.

Connecting Thought and Action for Beginners: A Meditation on Integral Philosophy and Experiments in the Yoga of Love, Action, Knowledge

Maureen Dolan[1]

Abstract: This paper has a two-fold purpose: to examine some of the main precepts in chosen works of Sri Aurobindo and Dr. Haridas Chaudhuri regarding the philosophical basis for integral understanding and to describe concrete ways to introduce the integral paradigm into practice in the U.S. within a particular undergraduate course titled *Body, Mind, Spirit: Yoga and Meditation* at DePaul University in Chicago. The introduction includes a brief description of the cultural milieu of 21st century American realities for adult students, identifying some of the conditions which can serve as impetuses to integral thought and action. The main text contains certain basic tenets of integral wisdom, which combine Eastern and Western thought in revolutionary ways, and examples from an introduction of integral yoga into higher education for adult learners. This can serve those who are just beginning to explore integral being and evolutionary action through intellectual, psychological, physical, and spiritual pursuits and those who already teach the integration of love-action-knowledge.

Keywords: Haridas Chaudhuri, integral yoga, integral education, integral philosophy, Sri Aurobindo.

Introduction

> *The true and full object and utility of Yoga can only be accomplished when the conscious Yoga…becomes, like the subconscious Yoga in Nature, outwardly conterminous with life itself and we can once more, looking out both on the path and the achievement, say in a more perfect and luminous sense: 'All life is yoga.'"*(Ghose, 1990a, p. 4)

We are presently living through some of the greatest transitions on the planet. These include: large ecosystem alterations of the earth (climate change and its effects); enormous societal changes (increased corporate globalization, resource wars, grassroots democratization, cross-

cultural exchanges); and transformations of individuals (in all aspects of thinking, doing, being). These systems changes are interdependent.

Modern complex conditions demand of us an unparalleled paradigm shift. The urgency rings clear for spiritual leadership and philosophical direction during these times and the task of educators is to prepare the ground for creative emergence of more integrated thought and action. The integral philosophy of Sri Aurobindo and Haridas Chaudhuri can provide leadership for academic areas such as contemplative studies, consciousness studies, and transformative adult education.

The U.S. is characterized by a dominant culture steeped in strong individualism, dualistic thinking, reductionist approaches, consumerist materialism, hierarchical power structures, and propaganda which promotes violence as a solution to problems. The present worldwide economic, energy, and ecological crises have exposed the necessity for more holistic approaches to the problems of life. Agitations from the larger systems' schismogenesis have increased the tensions in individual lives. People search for ways to make sense of their lives, feeling great hunger for spiritual renewal but still trapped in old ideas and conditioned habits.

Many people are coping with enormous changes by returning to school. Adults are returning to higher education to widen their economic opportunities but this action is also an invitation to expand philosophical understandings. Rarely do students at the initial stages recognize the transformational nature of the education process itself. However, the body of literature on adult transformative education is expanding rapidly to include more spiritual and multicultural perspectives (O'Sullivan, Morrell, & O'Connor, 2002; Palmer & Zajonc, 2010; Tisdell, 2003). In addition, a new body of literature regarding contemplative practices within education has emerged (Altobello, 2007; Duerr, Zajonc, & Dana, 2003; Robinson, 2004; Rockefeller, 2006; Roth, 2006). Scientific studies also point to a more holistic approach to the development of consciousness and cognition (Maturana & Varela, 1991; Varela, 1999).

Filled with family obligations, stresses from work and unemployment, and unaccustomed intellectual challenges, the circumstances of adult student lives can present difficulties. In addition, lack of health insurance for millions of Americans and detrimental U.S. lifestyle habits contribute to unhealthy, “dis-eased” students. Students have largely been trained to: hurriedly multi-task rather than concentrate; employ subject/object dichotomy in dualistic framing of themselves, the world, and knowledge; obey in hierarchical work structures rather than freely create; and separate body from mind from spirit. People are taught a distinctly undemocratic, fragmented way to be with their own entities and within society. These proclivities, combined with other obstacles, make learning in higher education settings problematic.

Restless bodies, agitated minds, and forgotten spirits need to be addressed in the process of education. Intellectual progress can no longer be separated from psychological, physical, and spiritual realities. Direct facing of the fragmentation problem can be turned into lessons for real self-finding (and world-finding) for students when combined with new learning through yoga. Yoga is an entranceway into necessary epistemological and philosophical shifts. Yoga is a metaphor for life's unity. Yoga is life and life is yoga.

Even though integral yoga goes beyond the hatha yoga of India and the popular westernized versions, physical yoga sets the conditions for quieting the minds of students. This prepares the ground for the planting of integral philosophy seeds. A few stretches, some breathing techniques, and meditation methods can open up possibilities for a wider acceptance of integral yoga concepts.

Philosophical Principles

> It is when we are guided from the very beginning with an integral view of Being to its multidimensional fullness that we can hope to understand philosophically the total truth as the identity of change and permanence, of the temporal and the eternal." (Chaudhuri, 1974, pp. 86-87)

Before illustrating applications of integral yoga, some basics of integral philosophy require exploration. The philosophical principles addressed here include: the nature of being and unity with the divine; non-dualistic thinking in the heart of yoga; emergence of the feminine principle; and evolution in love-action-knowledge.

The Nature of Being and Unity with the Divine

> Being is on the one hand cosmic energy and on the other formless eternity, self luminosity, formless being,, cosmic consciousness, unitive consciousness, creative void, unfathomable mystery, self-light of the eternal, mysterious self-light of Being, evolutionary urge of Being ...Whereas consciousness is an emergent value, the self-light of the eternal is the primordial reality. (Chaudhuri, 1974, p. 41)

In his writings, Sri Aurobindo elucidated the unity of Shankara's *transcendent being* with the Buddha's *non-being*. The nature of beingness, described in philosophical discourse by Western writers, is similar to Sri Aurobindo's yogic unity with the Divine (Ghose, 1990a). The conceptions of the divine as transcendent, as immanent in all of that exists, and as a personal God are three ways to experience the multi-dimensional beingness. While Chaudhuri employs the western philosophers' language of "Being" and "the Absolute," Sri Aurobindo explicitly and continuously used the word "Divine."[2]

The integral notion of being/divine goes beyond what the ancients had proclaimed because not only the ultimate ground of all being is realized, but also its dynamic nature is accented. integral yoga provides the steps for a more perfect unity with life. The aspiration for knowing our essential nature must first be in the heart of the seeker and surrender to the divine or truth is a prerequisite to this knowledge. Practices can develop the full surrender of ego in order to bring about the bliss of this mystical knowledge. Purely intellectual approaches for understanding ontological reality are insufficient. Both Sri Aurobindo and Haridas Chaudhuri have written with many references to the development of ontological ideas and metaphors in both the eastern and western traditions. However, the fullness of the experience is a spiritual, not an intellectual realization.

---

[2] Editors' note: These terms are not capitalized in the remainder of the essay to be consistent with the journal's publishing style.

Spiritual experiential learning promotes the dissolving of separative ego consciousness when enhanced by a call to participate in the infinite. This connection to enlarged beingness also diminishes fear and insecurities. It is a way to become familiar with immortality in the present (Chaudhuri, 1974, p. 139). The thrill of experiencing the impermanence of being is not the goal of integral yoga, however. This non-temporal understanding needs to be combined with the fullest flowering of the psychic, intellectual, and other potentialities of human existence for the purpose of participating in co-creation of a better world, for cooperation in the divine unfolding through history.

Non-Dualistic Thinking in the Heart of Yoga

> The fundamental requirement of our present age is to enlarge and enrich the nondualistic outlooks with a creative sense of history. A harmonious blending of eastern nondualism and western historicism can provide a comprehensive philosophy of life such as can inspire the future progress of civilization. (Chaudhuri, 1974, p. 22)

One of the greatest gifts that the culture of India has bestowed upon the world is the philosophical concept of non-dualism. In integral philosophy, this non-dualism reaches a new height. The heart of this is the unity of eternal beingness with an evolutionary unfolding. Under the huge umbrella of integral thought, we find the dialectical combinations of idealism and pragmatism, spirituality and science, mysticism and evolutionism, formless being and forms, essence and existence, the ultimate ground and multidimensional reality, change and permanence, the temporal and the eternal, subject and object, the knower and the known.

Non-dualistic thinking is a particularly difficult concept for Westerners to accept. A big part of this comes from the orientation of Eurocentric culture and the depth in which we are all trained to think in “either/or” rather than “both/and” categories. Another reason is the artificial division between means and ends. To fully grasp both distinctions and their unities, one needs to experience an embodiment of non-dualistic thinking. Chaudhuri refers to this as a “spiritual breakthrough” (Chaudhuri, 1974, p. 30). Without non-dualistic thinking it is difficult, if not impossible to grasp the full nature of being in pure eternal, dynamic universal, and individual manifestations.

The Emergence of the Feminine Principle

There are four fundamental principles of creative existence: aspiration, action, meditation, and love (Chaudhuri, 1965, p. 89).

One of the most profound contributions that Sri Aurobindo made in his philosophy was the importance that he gave to the feminine principle (Ghose, 1990b, pp. 724-753; Ghose, 1995a). His spiritual knowledge allowed him to see a future unfolding where there would be a rise in: women’s greater participation in all aspects of life; incorporation of feminine qualities into all humans in a more balanced way than had been seen in thousands of years; and spiritual renewal across cultures stressing devotion to the Goddess as Divine.

During the later part of the 20th century, the recognitions of feminine qualities such as feeling, receptivity, subjectivity, multiplicity, nurturing, cooperation, intuition, relatedness and social responsibility have come alive in practically all academic disciplines, in all aspects of life, and across cultures. That is not to say that their full power has been unleashed or that there is not great resistance to this evolutionary move, but the signs of a huge cultural transformation are underway (Eisler, 1987; Schiebinger, 1999; Shepherd, 1993; Shiva, 1989). Sri Aurobindo's partnership with the Mother (as embodied in Mirra Alfassa) and as the name for the Divine Feminine, his writings on the spiritual reality of Shakti energy, his sadhana work (spiritual discipline) to bring the descent of the unity of Shakti (feminine God-consciousness) and Shiva (masculine God-consciousness) power paved the way.

The thinking and practices of our human society have been hampered by gendered domination with overemphasis on rationalistic, mechanistic, and reductionist thinking. Sri Aurobindo has referred to the zig zag of our evolution prior to the 20th century as evolution in Ignorance, characterized by separation, but now humanity has the possibility of evolution through Knowledge, characterized by yoga or union.

The growing strength of the feminine principle creates the conditions for a wider surrender to the infinite, as well as real progress on a number of fronts, including a leap in our evolutionary development. But there still exists a great underestimation of how the absence of the feminine has distorted knowledge acquisition on many fronts. Where the masculine bias goes unrecognized (within both men and women), the truth of nature and humanity's essence are clouded over in ignorance and the impact is wide and deep. Dominator bias forms the basis for an inability to view the "other" as connected to self, promotes dualistic thinking, blocks the appreciation of the vast diversity of beingness in nature, and hampers receptivity to the divine. Ignorance of the feminine principle holds back our ecological sustenance and our evolutionary potential.

The entrance of many women into different walks of life during the 20th and 21st centuries and their needed participation in the move toward emancipatory evolution appear to have been premonitions in siddhis (spiritual gifts) that Sri Aurobindo brought forth in his decades-long spiritual practices. Sri Aurobindo's appeal to women spiritual seekers can in large part be attributed to his explicit elucidation of the importance of the divine feminine, the embrace of the Mother, and the incorporation of qualities that we attribute to the feminine side of humanity (Ghose, 1995a). For example, he wrote on human intuition and how this quality opens the possibilities for the divine force to enter (Ghose, 1990a, pp. 769-780).

The advances that have been made in human knowledge by use of the feminine principles are now being recognized across disciplines. Both men and women are seeing the world with new eyes in biology, anthropology, philosophy, psychology and other knowledge bases by employing a greater reflexivity; a sensitivity to context and cultural bias; respect for the ethic of cooperation with nature; promotion of humanitarian values; and the embrace of diversity and equality in varied communities. For the first time, women constitute the majority of undergraduates now in the U.S., a sign of Shakti energy moving within us (Ghose, 1990a). The shift from domination to partnership is taking on more urgency (Eisler, 2002). The unity of masculine and feminine qualities opens a new window for evolutionary development with wide ramifications for how we move forward in the 21st century.

Evolution in Love-Action-Knowledge

> The ancient idea of evolution was the fruit of a philosophical intuition, the modern is an effort of scientific observation. Each as enounced misses something, but the ancient got at the spirit the movement where the modern is content with a form and the most external machinery. (McDermott, 1987, p. 70)

The marriage of eastern mystical gnosis of the divine with western advances in understanding evolution was a world-historic transformation in philosophical thought. Sri Aurobindo successfully combined these in the beginning of the 20th century.

> The nontemporal is without doubt the most fundamental aspect of reality. It is the ultimate ground of existence...It is no doubt the foundation of existence. But existence has also its superstructure of ever-emergent values in the historical medium. The absolute can therefore be no less than the unity of the non-temporal and the historical. It is Being in its multidimensional fullness. (Chaudhuri, 1965, p. 104)

This recognition opened the gateway toward a more profound understanding of unity with the divine and the participation of humanity in conscious evolution.

Both Sri Aurobindo and Chaudhuri explained the reconciliation of inner spiritual truth with human outer action. Drawing on the knowledge from the Bhagavad-Gita and Vedanta, his own investigations into modern advances in science and psychology, and the sadhana union with the divine, Sri Aurobindo formulated the love-knowledge-action integration in a unique way and Chaudhuri found ways to apply it to late 20th century thought and action (Ghose, 1990a, 1990b, 1995b; Chaudhuri, 1965, 1974, 1977; McDermott, 1987). Combining the yogas of *jnana* (knowledge), *bhakti* (devotional love), and *karma* (work and action), Sri Aurobindo offered an amalgamation which far surpassed what had been taught in the East or West on the spirit of humanity, the nature of the absolute, and the evolution of consciousness.

The whole point of self-transcendence is not just seen for individual liberation but for the transformation of humanity through new consciousness and the use of divine love in evolution. This revolutionary worldview is about universalizing ourselves with divinity/being in order to bring forth more love, more knowledge and more action in the service of all. Integral yoga is an invitation for greater freedom and greater responsibility because we become co-creators with the divine. In this sense, the integral philosophy opens us not only to individual spiritual transition but also to species transformation.

The understandings which Sri Aurobindo articulated on evolution of the mind stand as examples of that very evolution as well as pathways for others to follow Chaudhuri's leadership in both philosophy and education illustrate that collective progress and individual progress are interdependent in the field of love-action-knowledge.

Beginning Applications of Integral Yoga

> Integral yoga may be defined as the art of harmonious and creative living. It stresses the need for the balanced growth of personality; for constructive development of the latent possibilities of one’s nature; and for their employment in the service of mankind and such higher values as truth, justice, freedom, peace and progress. (Chaudhuri, 1965, p. 37)

I teach at DePaul University which has as part of its mission the intention to educate urban, immigrant, and historically excluded populations. Many students are in the first generation of their families to attend college. While there are some economically privileged students, quite a few students come from war-torn countries and from the U.S. working class. Many older students have endured and/or resisted sexist and racist societal practices. Some students are recovering from addiction abuse and some are rebuilding lives after war service in Iraq or Afghanistan.

Two-thirds of students are women and several classes have been, in majority, people of color. They come from diverse faith traditions and many with no religious affiliation. All are weary from the present economic shocks and want to make sense of their life experiences. They hunger for spiritual sustenance. Integral yoga can feed this hunger: “… integrating body, mind, spirit for the greater participation of the Spirit in terrestrial life becomes an important objective of Integral Yoga. To manifest the Divine in humanity…is the whole point of Yoga (Singh, 2008, p. 52).

Since the course teaches both science and spirituality, we discuss how western culture has compartmentalized knowledge. Students also make distinctions on what is culturally learned and what is natural to humans. Talks in class bring forth the differentiation between religion and spirituality and the key unity underlying all spiritualities is explored.

Of all yogas, hatha is the most popular in the U.S., largely due to its appeal to the physical in a society so steeped in materialist aspects. Hatha yoga consists of a growing number of styles with varying use of meditation, and with teachers who span a wide spectrum from barely knowledgeable to very educated teachers imbued with a spiritually integral base. About sixteen million Americans have taken up yoga; its acceptance of its followers as a subculture in this country is a given. In the hundred years of its development within the U.S. and its increased availability in all sectors, yoga has served to break down some cultural barriers.

In Americans, well-schooled in ethnocentric and xenophobic ideologies, participation in hatha yoga proves that there are bodies of knowledge that come from other cultures and times. The limitations of this particular yoga, however, include: overemphasis on the physical; overemphasis on individual liberation; and separation from the other yogas and its spiritual base.

The *Body, Mind, Spirit* course consists of ten three-hour classes. The first hour takes place in a chapel with practice of yoga postures, breathing techniques, meditation methods, and journal writing. I read portions of the *Yoga Sutras of Patanjali* as students rest in *savasana* (relaxation)

(Shearer, 2002). In each class, our actions are offered up to the infinite — in whatever form that holds meaning for participants. Some people give their intentions to Jesus or to God, Buddha, Allah, Goddess, Yahweh, truth, healing, or peace. Throughout Chapel sessions, I remind students to: practice non-violence; unite with the Infinite; yoke together body, mind, spirit; breathe deeply; act in order to know; engage in self-healing; be present in the moment; hold an image of divine within; experience the unity of flexibility and strength, relaxation and tension, change and permanence; and open the heart.

After a break, students resume work in the classroom for group discussions and presentations. Course objectives include the development of proficiencies in: exploration of a model of spiritual development and its application; understanding the interrelationships among intellectual, psychological, spiritual, and physical health in one’s life; descriptions, categorizations, and explanations of change within human biological systems; and assessment of health care practices based on an understanding of the biological and social factors that contribute to health.

Each student reads a short inspirational passage or prayer of peace to open and close the classroom portions. These “inspirations” demonstrate the vast diversity of human insights and cultural meaning-making which can open the heart to fuller embrace of the Divine and serve to concretize what Haridas Chaudhuri expressed:

> The different peoples of the world do indeed exist by being closely related to one another…essentially interdependent. They are inseparably associated members of the cosmic whole. They live, move and have their being in one indivisible cosmic medium. An active realization of this truth produces cosmic integration. (Chaudhuri, 1965, p. 87)

Small groups work on presentations which educate on the systems of the body/mind/spirit complex and the ways yoga can contribute to health and connect to the Infinite. Final papers serve to consolidate the learning in both reflection and research.

“There are three essential ingredients in the realization of complete self-integration: psychic integration, cosmic integration, and existential integration” (Chaudhuri, 1965, p. 83). Psychic integration includes recognition of the vastness of the unconscious and discovering ways to bring the unexamined shadow sides of ourselves forth in order to integrate the human personality (Shirazi, 2010). To that end, journal writing is encouraged (both in specific time periods within class and also at home on a regular basis) to draw out observations of the self after the experience of yoga postures, breathing, meditations, studying, and participating in group projects.

For those who are just beginning to come to some understanding of integral knowledge, the discovery of unconscious limitations and biases is of utmost importance. Most Americans do not understand how their ideas and behaviors have been shaped in social construction by cultural models. Experiential yoga learning and self-study reflections reveal unconscious patterns and uncover what has been covered. I collect the journals to read and meditate upon each one before providing a reflective commentary. The unconscious is addressed by providing a sacred space for the beginning half of the class in the Chapel where the practices of yogic postures, breathing, and meditation take place. In particular, there are certain practices which appeal to the unconscious.

For example, *The Healing Journey*, has proven to be very effective as an experiential exploration (Shraddhananda, 2003).

The classroom portion includes a circle of chairs. The environmental structure of the learning venue can have a powerful impact on the unconscious, as well as the consciousness in individuals, as Chaudhuri pointed out: “The truth is that consciousness is a much wider category than rational thinking” (Chaudhuri, 1974, p. 37).

Cosmic consciousness, which links the individual with all of nature and the divine, is a difficult concept for those so ingrained by American individualism. Therefore, partnership exercises are of utmost importance, an essential component to get a feel for unity of all and beginning notions of our essential interdependence. Incorporation of yoga partner poses allows students to embody trust and negotiation skills necessary for partnering on projects in class. In a society where distrust is rampant under the domination model, the creation of partner poses gives the opportunity for a completely different experience of “the other.”

Cooperative work in research assignments for presentations also underscores the necessary reliance on each other for knowledge creation. Interdependence is necessary for balance in body/mind/spirit. The course work provides constant reminders of interconnectedness within systems: tying together love for oneself, others, devotion to the infinite; individual intellectual pursuits in research combined with cooperative sharing of knowledge; and importance of taking action and seeing how one’s actions have impact on others through partnership poses, small group work, and community involvement.

Cosmic recognitions also come in the form of two particular healing meditations. One is the chakra meditation done in pairs where one person gently places fingers on the spine of another person. The person sitting in back slowly, gently moves the fingers up the spine through the seven major chakras (energy centers) while meditating on healing energy. The person in front meditates on receiving healing energies. It takes about 10-15 minutes and then the students switch places.

Another healing meditation is the “Sound Bath” where one person is situated comfortably in savasana in the middle of a close circle of other students. The person in the center meditates on receiving the group’s healing energies. The group chants vowel sounds in a continual flow of *aaah, eee, iii, oo, uu* which grows in strength, diversity, and fluidity. Members of the circle meditate on sending healing energies through sound to the person in the center.

While these particular meditation techniques are designed to enhance partnership practice and cosmic realization, they also serve to cultivate individual mindfulness and loving attention.

Given the dominant culture’s recursively reinforced attitudes and behaviors of individualism, competition, disjunctive learning, reductionist thought, these practices provide embodiment of alternative views. The strength of the dominator paradigm, with its accompanying Eurocentric focus, in American society requires intense opportunities for immersion in partnership skill-building.

Without adequate stillness of mind, unity with the ground of existence remains elusive. This existential reality cannot be approached through the intellect or the senses but requires a transcendent experience. First, there must be a desire to unite with that larger beingness and then there must be the conditions set for this unity. Spiritual practices come in many shapes and forms to allow for this opening. Chaudhuri outlined several methods of meditation (Chaudhuri, 1965, pp. 117-155).

Integral philosophers point to what has to be healed: “Consequently, the divide that exists between spirit and matter, between spirituality and science, between arts and spirituality, between philosophical and practical life, between religious and mundane, between sacred and profane, needs to be healed” (Singh, p. 74). The first steps in the spiritualization process are not only possible but in evidence from many of the over 600 students engaged in this learning thus far and hatha yoga proves to be a good entranceway. As Dr. Chaudhuri pointed out body consciousness is the foundation for our evolving spiritual life (Chaudhuri, 1974, p. 188).

Each class can be roughly viewed in thirds of varying numbers. Perhaps, a third of the people have already made progress on spiritualizing their lives and seek refined teachings as they prepare for a leap in their own evolutionary progress. These students take hold of integral concepts and embrace participation in evolution through the unity of love, action, knowledge. They already embody a more integral approach to life with an understanding of the transcendental, immanent, and personal experience of the divine and see themselves as vehicles for dynamic creative energy.

A middle third have been conscious of their spiritual searches but not yet disciplined enough to make steady progress. Their work may lift them to the level of those who entered at a higher level. The combinations of learning styles through body work, intellectual research, reflective self-observation contribute to deep practice immersion. The final third begin with relatively closed minds/hearts but gain some benefits at the physical or intellectual levels. These students, depending on adherence to practices, may open their hearts.

For each student, the awakening experienced through meditative practices, intellectual research, and collaborative work is quite unique. For each, the seeds of an integral view take root in different ways and at an individualized pace. The duty of the teacher is to be attentive to the particular journey of each seeker. This includes dialogic discussions in class; guidance during the yoga portions; personalized feedback on journals, presentations, papers; individualized correspondence through emails and phone calls; and mindfulness of the teacher’s own practices as example and as instrument for transformation. As Sri Aurobindo said: “All teaching is a revealing, all becoming is an unfolding. Self attainment is the secret; self-knowledge and an increasing consciousness are the means and the process” (quoted in McDermott, 1987, p. 142).

Students learn by placing their own subjective experiences into wider contexts, becoming their own experiments in evolutionary consciousness. The goals of integral yoga include integration and transformative experience within the context of an evolving “embodied consciousness” (Shirazi, 2010). It is not just new experience through yoga but also the reflexivity on the process which leads to learning. Action and reflection on action helps dissolve the constructed personality and illuminate the spirit (McDermott, 1987, p. 66).

The advent of unity in subjective/objective reality and the increasing accent on reflexivity in higher education sets the stage for greater changes. As Sri Aurobindo so aptly said:

> …the most important element…is the unpreparedness, the unfitness of the society or of the common mind…which is always the chief stumbling block…for even if the condition of society and the principle and rule that govern society are opposed to the spiritual change, even if these belong almost wholly to the vital, to the external, the economic, the mechanical order…yet if the common human mind has begun to admit the ideas proper to the higher order…and the heart of man has begun to be stirred by aspirations born of these ideas, then there is hope of some advance in the not distant future. And here the first essential sign must be the growth of the subjective idea of life, - the idea of the soul, the inner being, its powers, its possibilities, its growth, its expression and the creation of a true, beautiful and helpful environment for it. (quoted in McDermott, 1987, p. 194)

The diverse cultural mix of the class and the varying levels illustrate the multiplicity inherent in our human condition and in our search for meaning. This helps call forth in each student a love for the multidimensional nature of our existence and promotes a way of seeing "both/and" rather than "either/or." The course combines affective, cognitive, and physical approaches to learning because the intellectual level alone cannot grasp these deep concepts.

Conclusion

> The aim of the yoga is to open consciousness to the divine and to live in the inner consciousness more and more while acting from it on the external life, to bring the inmost psychic into the front and by the power of the psychic to purify and change the being so that it may become ready for transformation and be in union with the Divine Knowledge, Will and Love. (McDermott, 1987, p.91)

The resolution to organize one's life around spiritual values, spontaneous outpouring of freedom in acts that promote the evolution of humankind, cultivation of meditative practices, and embodiment of cosmic love form the core principles of integral work. This is a tall task but it is our road to freedom, as Chaudhuri explained: "Spiritual freedom in its fullness is neither an abstraction nor a transcendent flight…It is the unity of knowledge, love and fruitful action…Action, love, wisdom, and peace are equally important elements in such self-integration" (Chaudhuri, 1965, pp. 76-77). Combining meditation and action leads to compassion and illumination (Chaudhuri, 1965, p. 141).

The works of Sri Aurobindo and Haridas Chaudhuri stand as glowing advances in philosophical analysis and spiritual experience. With poetic phrasing Sri Aurobindo gave profound expositions of the integral view which provide a deep feeling-state with each reading. Each chapter can provoke intellectual challenge and spiritual awakening. Using excerpts from books such as *The Synthesis of Yoga* and *The Life Divine* can help inspire and guide teachers on the integral path. Chaudhuri's works built on Sri Aurobindo's integral views and are especially helpful to those schooled in western philosophical thought.

Sri Aurobindo did not want to promote dogmatic following; he knew diverse methods can lead to the goals of integral understanding. Both Sri Aurobindo and Haridas Chaudhuri wrote very explicitly on the benefits and limitations of the various yogas (Ghose, 1990a; Chaudhuri, 1965). My experiments with integral yoga are just one way to introduce integral concepts in a learning environment. We can charge ourselves with the task of contributing innovations and expansions in integral knowledge in accordance with Sri Aurobindo:

> An integral…yoga needs especially not to be bound…for while it embraces the knowledge received from the past, it seeks to organize it anew for the present and the future. An absolute liberty of experience and of restatement of knowledge in new terms and new combinations is the condition of its self-formation. (McDermott, 1987, p.144)

Integral Intelligence: A 21 Century Necessity

Anne Adams[1]

Abstract: This article explores the critical role education plays in the attitudes, behaviors, results produced, and ultimately our every day experiences of our world. Integral education is introduced as a catalyst for transformation, moving our emphasis in education from gathering knowledge to growing consciousness. Expanding awareness provides a paradigm shift from epistemology to ontology, which would fundamentally alter where our attention is focused, from having and doing to being—providing an opening to directly experience ourselves as the creators of our reality.

Keywords: complexity, epistemology, inquiry, integral education, integral intelligence, integral worldview, ontology, paradigm, transformation, wisdom, vicious cycle, virtuous cycle.

Introduction

The intent of this article is to utilize an integral viewpoint to look at our world and bring a quality of awareness that has yet to be fully distinguished. An integral perspective is committed to weave together the seemingly isolated, fragmented and disconnected phenomena that take place in our world, in a manner that allows for seeing with new eyes. It encircles horizontally and is at the same time deeply rooted vertically. When people experience and understand how different occurrences *connect* together to create a full picture, it changes the way they think, act, speak, and listen, and the way they view the world— a larger picture becomes apparent and their relationship to that image is made clearer.

A number of areas will be addressed in the following pages regarding the current educational approach in the United States and the quality of the world it creates and perpetuates, as seen from various vantage points, e.g., scholars, educators, students. Integral Education is presented as a model of our future education with its commitment to *educating for* an integral worldview.

Quality of Education = Quality of World

The premise of this paper is: *we get what we educate*. The world we live in, feel, and observe around us is directly correlated to our educational experiences. What is happening in our world and our responses to it, whether it is close—as in family, friends, school, community or city—or farther away—as in state, nation, region or globe—reflects the context, content and practices of our education. The focus of this article is an inquiry into the nature of our world and the impact our way of educating has on that world. The United States and its approach to education are highlighted and extrapolations can be made to other countries.

This article is an invitation to its readers to an inquiry of the highest order: to engage in questions around the quality of world being created by the kind of education we are providing ourselves and our young people. If our education is the foundation for our future, what is the quality of future we are living into given our current approach to education? What is going on in our world, in business, in our communities, in our religious institutions, and throughout our educational institutions... in our collective consciousness, how we think, the quality of that thinking, how we feel, about ourselves and each other, the way we relate to one another, what we think is important, our values, etc.?

There is an active conversation among educators, scientists, policy makers, the media, parents, government, and business people about the role education should play in preparing people to live successfully in a complex world. Practitioners in many disciplines are divided over this role, and offer an either/or approach; e.g., either "we must produce more graduates in science, math and technology," or "simply adding analytical skills to traditional curricula would be wholly insufficient to convey a general understanding of complex phenomena;" or "modern sciences fail to acknowledge the complexity of the real world, and foster a misleading certainty of expectations that leads people to pursue simple solutions for complex problems, and to discount contrarian ideas and 'inconvenient truths'" (Abeles, 2010, pp. 2-3).

Our world is increasing in complexity exponentially. It involves many intricate parts that require an ability to make linkages; e.g., bringing the seemingly unrelated to a place of relationship and connection. This complexity of new technologies, diverse cultures/belief systems intermingling, internet/information access, media proliferation, international economic and political interdependencies; globalization of businesses, cultures, awareness, connections; the reinvention of the family constellation, education, politics, religions, and so on, has multifaceted everything. "Our culture is in a constant state of change and evolution" (Robinson, 2001, p.176).

The 21st century complex world demands an integral approach, one that encompasses seeming paradoxes with a both/and viewpoint—a complete transformation of our established epistemology. A new paradigm is required now which is gradually emerging, representing the beginnings of a true transformation in the way we think and act. Susanne Langer, an American scholar of the philosophy of mind, captures it with this imagery:

> A new idea is a light that illuminates things that simply had no form for us before the light fell on them and gave them meaning. We turn the light here, there, and everywhere the limits of thought recede before it" (as cited in Robinson, 2001, p. 73).

The intent of this paper is to shine that quality of light on our world today.

The Void in Education

Sri Aurbindo, the Indian spiritual philosopher, educator, and activist saw the evolutionary turmoil humankind was undergoing in the 20th century. In his writings and teachings he spoke about the quality of society being manifest: "Man has created a system of civilization which has become too big for his limited mental capacity and understanding and his still more limited spiritual and moral capacity to utilize and manage" (Ghose, 1976, pp. 1053-1055).

Three decades later he is echoed by Ervin Laszlo, a philosopher of science, a systems and evolution theorist, and integral thinker. "We are in a spiritual crisis at the moment. We need to upgrade and update our consciousness. Our technology has evolved faster than our spirits have; we need a spiritual revolution" (Laszlo, 2005).

Peter Senge (2004), an MIT professor, system theorist, and consultant to businesses, adds his agreement in his most recent book, *Presence: Human Purpose and the Field of the Future*, "…the industrial age school continues to expand, largely unaffected by the realities of children growing up in the present day" (p. 7). The task of encouraging thoughtful, knowledgeable, compassionate global citizens in the twenty-first century is not being addressed consistently with the world we are living into. These educator/scholars are joined by many other voices.

Robert J. Sternberg, professor of psychology and education at Yale University and director of its Center for the Psychology of Abilities, Competencies, and Expertise, is committed to educating for wisdom:.

> I do believe that we need to rethink our goals in education. Increased academic skills may be necessary for many kinds of success, but they are not sufficient. Students need something more. We need to teach students not only knowledge but also how to use that knowledge well, e.g., thinking wisely and encouraging students to develop their own values while understanding multiple points of view. Teaching for wisdom recognizes that there are certain values—honesty, sincerity, doing toward others as you would have them do toward you—that are shared the world over by the great ethical systems of many cultures. (Sternberg, 2002, pp. 1-3)

Sternberg also stresses balance: "students learn to include their own interests with those of others and those of larger entities, like their school, their community, their country, even God" (p. 2).

Sir Ken Robinson, author, speaker, and international advisor on education, also "challenges the way we're educating our children and champions a radical rethink of our school systems, to cultivate creativity and acknowledge multiple types of intelligence" (Robinson, 2010). One of his major contributions is continuing to explore the importance of creativity in the educational system and its link to the economy of a country. To the question, “Why don't we get the best out of people?” he retorts:

> It’s because we've been educated to become good workers, rather than creative thinkers. Students with restless minds and bodies—far from being cultivated for their energy and curiosity—are ignored or even stigmatized, with terrible consequences. We are educating people out of their creativity. (Robinson, 2010, Ted Talks).

Uncovering Vicious Cycles

A vicious cycle is a complex series of events, which reinforces itself through feedback loops. Each iteration of the cycle reinforces the previous sequence, ultimately leading to detrimental results. It is a situation in which the solution to one problem creates a chain of problems, each making it more difficult to solve the original one. The cycle will continue in the direction of its momentum until an external factor intervenes and breaks the series. Our current way of educating has created many vicious cycles. Inquiring into our system of education is about shining a bright enough light so the unseen can be given the quality of form necessary to illuminate the meaning sufficiently to unravel the vicious cycle.

In 2011, the world we live in is no longer rooted in the economic model of industrialism and the intellectual model of academicism. Both are outdated and inadequate to what is needed today (Robinson, 2001, p. 23). This leads to an education curriculum that is separated from the real world and less relevant to being successful in the real world. And, everything inside this vicious cycle, e.g., the teachers, administrators, parents, students and the public, more often than not, continues to reinforce one another.

Teachers teach inside of, and are assessed using criteria within, this outmoded paradigm; parents want their children to succeed inside this outmoded paradigm, schools and universities want funding inside this outmoded paradigm, students either want to achieve and continue in the outmoded paradigm, or they drop out in many different forms, which is becoming more often the case, e.g., from 23% in 1969, to 31% in 2007—46% of black students, 44% Latinos, and 49% Native American did not graduate in recent years (Khadaroo, 2010).

The public often continues the cycle with ignorance, denial, confusion, complacency, reactivity and/or righteousness. As Mahler puts it:

> …false dichotomies seem to have replaced fruitful conversation.
> If you support the teachers union, you don’t care about the students.
> If you are critical of the teachers union, you don’t care about the teachers.
> If you are in favor of charter schools, you are opposed to public schools.
> If you believe in increased testing, you are on board with the corruption of our liberal society’s most cherished values.
> If you are against increased testing, you are against accountability.
> It goes on and on. Neither side seems capable of listening to the other. (Mahler, 2011, p. 9)

Trying to change things inside of a disintegrating paradigm provides nothing; the system needs to be reinvented (Robinson, 2001).

Because of its nature, the vicious cycle is very difficult to see or grasp. There are so many “feedback loops, with each iteration of the cycle reinforcing the previous,” it acts like a haze that covers what is there …it seems impossible to really get one’s hands around it sufficiently to get the traction to take definitive action, e.g., “academics gets confused with education and qualifications with abilities” (Robinson, 2001, p. 57). “The high-stakes testing movement, for example, seems to emphasize knowledge acquisition much more than the socially desirable use of that knowledge” (Sternberg, 2002, p. 2).

There are very deeply seated beliefs, assumptions, and values, which stem from before the Renaissance about what it means to be educated and which we continue to take for granted—we come to think of our views of this reality as, “the way it is” or “common sense.” “The relationships between our education and the world we actually live in are being stretched to breaking point and they need now to be entirely rethought” (Robinson, 2001, p. 93).

Vicious cycles also show up in how we value our education, the amount of money we are willing to pay our key influencers of our children’s educational experiences; we allow mediocrity to go unaccounted for, e.g., the lack of interest in creating mutual accountability throughout our educational institutions. We spend more money on prisons than schools, “six times the amount” (Lehrer, 2011) and we compensate our professional sports players abundantly more (between 3 and 20 times) than the keepers of the keys to our future. We fund weaponry and wars before excellence in education. At least 200 billion dollars more is spent on war than education (Conetta, 2010) & (US Department of Education, 2010). These examples all indicate a way of thinking that is worthy of our inquiry.

How do we relate to our media and the role it plays in creating our educational experience of our world? Watching television, entertainment, sports and music events, advertising, listening to radio…what is the quality of the communications to people? What “world” are they creating? How well do these mediums continue the vicious cycle? Where does the cycle start ….and end, or does it ever? Is it our education which brings us to thinking in a particular way, or is it our culture, our families, our government, politics, religious affiliations, the media, …”the way everyone else thinks,” that has us believe that this is the way is should be? Is this a great example of the vicious cycle in action? Our education and our culture continually reinforce each other without external intervening factors that break the cycle.

Current US Education Approach

Tony Wagner, past Director of the Change Leadership Group at Harvard University’s graduate school of education and author of the seminal book, *The Global Achievement Gap*, addresses many vicious cycles in education. His book is filled with data from interviews with teachers, students, parents, and business people, and observations of schools and university teacher education classrooms. He spent time in the "best" schools with the highest SAT scores and found students more focused on a “right answer” than creative reflection and serious inquiry. J. King, an MIT professor remarked about students who have top scores in Advanced Placement courses, “They don’t know how to *observe.”* When asked to describe what they see, “They want to know what they should be looking for—what the right answer is” (Wagner, 2008, p. 7).

Deborah Meier, professor at NYU’s Steinhardt School of Education agrees: “We've also left precious little space in school for our youngsters to ask serious questions that have no "right" or "wrong" answers” (Meier, 2010). The mood in the classrooms Wagner observed was mechanical, students unreflective and rigid in their responses to questions. Teachers were teaching to a “core curriculum,” (standardized tests) with much memorization, methods that “are quickly becoming an epidemic in our nation’s schools” (Wagner, 2008, p. 59).

Students’ relationship with learning felt stilted, linear, and detached. Diane Ravitch, Research Professor in Education at NYU and educational historian adds her agreement to that of Wagner, Meier, Sternberg, and Robinson cited above, “The schools will surely be failures if students graduate knowing how to choose the right option from four bubbles on a test, but unprepared to lead fulfilling lives, to be responsible citizens, and to make good choices for themselves, their families, and our society” (Ravitch, 2010, p. 1).

Stephanie Pace Marshall, internationally acknowledged educator, in her book *The Power to Transform,* critiques the current approach to education in the United States by asserting that our current patterns, processes, and structures of schooling are not designed to ignite our children’s joy, intellectual energy, and imagination. She believes that this is because they are conceived and framed within a context of scarcity, deficiency, and fragmentation, rather than a dynamic or integrative approach that would enable our children to engage with passion in exploring their real questions about life (Marshal, 2006).

Teacher education is another major contributor to the vicious cycle. Arthur Levine, the former president of Columbia University Teachers’ College, in two highly influential studies of teacher education, found many students graduate without the skills and knowledge they need to be effective teachers. Sixty-two percent of responses, (alumni and students) report schools of education do not prepare their graduates to cope with the realties of today’s classrooms. According to Levine,

> …education school faculty’s lack understanding of the current challenges in schools and classrooms….the experience of faculty were not recent or long enough,… lessons are often out of date, are more theoretical than practical, thin in content. The curriculum is often fractured, with a lack of continuity from one course to the next, and [there is] insufficient integration between course work and field work. The schools foster docility with too many lecture courses and too few opportunities for problem solving and original thinking. (Levine, as cited in Wagner, 2008, pp. 145-146)

Students in our schools are taught by people who are educated in a “teacher-education curriculum that is a confusing patchwork, with academic instruction and everyday issues disconnected” (Wagner, 2008, p. 148). This is the ultimate of the vicious cycle. “Take a disjoined collection of course of uneven quality and then pass tests that rarely measure the skills that matter the most” (p. 148). Add to that, “close to fifty percent of the teachers in the United

States come from the bottom third of college classes and teacher compensation is much lower than other professions graduates can choose” (Jones, 2011, p. 33).

Levine also looked into the educating of school principals, including those programs at Harvard and Columbia, and concluded that …

> The core curricula of the nation’s principals are a random collection of courses. …a grab bag of courses… If one removed the class on the principalship from the list, it would be a real challenge to guess the purpose of the program. (as cited in Wagner, 2008, pp. 147-148)

Wagner (2001), in his research of education in the United States, distinguished four major themes, which provide more powerful examples of the vicious cycle and how it manifests, often subtlety, in our educational institutions and ultimately in our “educated” populace. The culture of our education creates and perpetuates reactivity, compliance, isolation, and no real sense of accountability. Educators have to react to a cacophony of urgent needs and demands

Every day. We can’t say no, and everything is a priority. Most of us haven’t developed the discipline of reflection as a way to remain focused on the truly important. The education culture has tended to reward compliance to authority at all levels over active questioning or genuine discussion of issues. School district leadership rewards compliance rather than creativity and initiative.

> Educators work alone more than any other professionals in modern America. Most professions have come to recognize the value of teamwork as a better way to understand and solve ‘problems of practice.’ Groups are far more likely to come to a deeper understanding, and to better solutions, than are individuals working alone, no matter how talented…. Broad ‘ownership’ of the problem a school or district needs to solve is rare in compliance-driven change efforts, where concern for positive PR trumps true public engagement and unfavorable data are downplayed…. To be effective, however, accountability has to be two-way and horizontal as well as vertical. What is our reciprocal and relational accountability to one another. (Wagner, 2001, pp. 1-6)

A New Educational Paradigm: Creating Virtuous Cycles

That intelligence plays an epistemological role in our education is a universally accepted premise. The idea that intelligence plays an ontological role as well represents a transformation in the purpose of education. Ontology is the study of the nature of being, i.e., one’s essential nature, the nature of reality. Acknowledging the importance of an ontological framework for education shifts its primary intention and attention from *knowing* to *being.* If accepted, this expanded interpretation qualitatively alters how we relate to education.

Emphasis transfers from *knowing* first, to *being* first—recognizing that who one is *being* in the process of *knowing,* is senior to what one *knows* in the process of *being.* What is suggested in this thinking is that including the nature of being and reality at the beginning of the process of knowing would substantially alter the quality of knowing occurring and the subsequent actions taken as a result of that knowing.

An example might be that when one brings a sense of wholeness and integration *of* one's experiences of the physical, spiritual, emotional, and mental intelligences, the learning occurs inside of a worldview that is capable of generating a paradigm of connection, relatedness and integration, i.e., both/and, rather than separateness and isolation, i.e., either/or. This way of viewing the world provides a very different learning context than that of dichotomizing, competing, winning, losing, e.g., either you or me… either them or us. Both the philosophical and pragmatic aspects of education represent the creation of our essential nature and our relationship with reality. Integral education has the potential to transform our essential natures and our experience of what is real.

Integral Education

Integral education is an approach to education that provides a powerful foundation for living life and preparing people to live in a complex and ever changing world. In this model, the first 18 years of a person's life are focused on developing and integrating the physical, spiritual, emotional and mental intelligences. From a very early age, young people learn to relate to the world with an integral worldview. Thus, the introduction to the adult phase of their life is grounded in educational experiences which have interwoven these powerful expressions of human consciousness. The focus is foremost on the ontological aspects of intelligence, i.e., the *being* of the human being, which in turn provides a life altering context in which learning occurs.

The living of one's life is viewed through the lens of wholeness and relationship: connection to oneself, others and all of nature as an *embodied* phenomenon. This is an education *for* wholeness in a human being. Wholeness does not mean perfection. It means "becoming more real by acknowledging the whole of who I am" (Palmer, 1998, p. 13).

Physical intelligence is seen as *fundamental* to an integral education experience. There is an acknowledgement of the essential relationship between biology (earth), chemistry (foods, substances), and physics (energy) at the core of this approach to education. There is "groundedness," consciousness, and connection with the natural elements. There is a tacit form of knowledge in bodily knowledge (Adams, 2006). "The clues that allow us to know anything come from our relatedness to reality–a relatedness as deep as the atoms our bodies share with everything that is, ever has been, or ever will be" (Palmer, 1998, p. 98).

This embodiment of the physical has ontological implications. It communicates a particular reality and way of being that introduces students to what is real for them; what is real for them is in their body, in their experiences, and senses. It also has epistemological connotations. What and how these students know as a grounded embodied individual influences the way they relate to knowledge; it is relevant to them on a very basic level. It is learning that is connected on many layers–energetic, cellular, muscular, sensory, and kinesthetic (Adams, 2006).

The emotional intelligence plays a *relational* role in integral education. Connections are seen throughout. People are in community; they are in communication, with themselves and each other; they are caring and cared for; they are learning the skills to remain in community and communication, e.g., conflict resolution, dialogue, and mediation. Focus is placed on the experiences of safety, belonging, relationship, love, being known, self-expressed, responsible, service and mentorship of others to support the development of emotional intelligence in everyone, e.g., students, teachers, parents, etc.

This relational pattern in the emotional domain has ontological implications. It communicates a particular reality and way of being that introduces students to what is "real" for them; *they are related*. It also has epistemological connotations. What and how these students know as relational individuals influences the way they interact with what they are learning. What they are learning *is connected to them*. What is being learned is not separate or disjointed; it is *related to them* (Adams, 2006).

At a conference hosted by The Mind Life Institute, and attended by close to 4,000 participants from around the globe, with scholars, educators and a number of deans from major American schools of education (e.g., Harvard University, University of Michigan, Stanford, Pennsylvania State University, Rice University, University of Wisconsin, Carnegie Foundation), the major conference theme was developing emotional intelligence in our populace, e.g., "the education of hearts as well as minds; socio-emotional development; compassion and empathy; and generating authentic relationships. Experience based learning; belonging, caring, community, sense of mastery, responsibility, owning one's own power, generosity etc…" (Mind Life Institute, 2009).

The *natural* role of the mental domain is respected in the integral curriculum. Mental intelligence is known to expand in an environment in which students are encouraged to love learning, be curious, and follow their passion. When the learner is respected, trusted, and honored as an individual and educated to think and learn for him/herself, given choices and responsibility for what is studied, the *natural* quality of learning is activated.

Students exposed to curriculum that is experiential and relevant can embody the content and the context. The growth of mental acumen is equated with trusting the human being in his/her natural quest of learning. There is a recognition that the purpose of education is to provide an environment in which the inherent attributes of the individual can *naturally* grow and take root. If the context is known and the learning is relevant, the learner can also be at choice and responsible for her/his education.

The inferences from these interpretations are valuable when considered from an ontological perspective. The reality is—humans have a *natural* love of learning and curiosity that only requires room to express and grow; children can be responsible and trusted with their own education. Who we are as human beings at the most fundamental level are *natural* learners. Epistemologically, these interpretations offer an essential shift away from current educational practices. They suggest the *natural* aspects of learning - learning belongs to the individual (Adams, 2006).

> Modern brain research shows clearly that children are natural learners. They are born wanting to learn and would continue being voracious learners if they were in an environment that is truly learner centered. They need the kind of learning environment that

> is not a system, but which enables them to find the help and information THEY need and ask for. They need adults around them who respect them as individuals, know how to listen to them and can help guide them to the resources they need. (Mintz, 2011, p. 1, emphasis in the original)

Spiritual intelligence plays a *contextual* role in integral education. It gives a sense of congruency to life. Students are educated in ways that their sense of "spirit" can show up in their lives, i.e., seeing themselves in relation to a larger world, feeling connected to themselves, others, and nature. The holistic approach provides practices to support individuals getting more related to themselves and others through internal experiences such as contemplation, self-reflection, journaling, silent time, meditation, yoga, exercises, etc. The integral curriculum includes understanding and honoring the world's religions, learning the distinction between spirituality and religion and having clarifying conversations that bring people together and promote interfaith inclusion rather than exclusion and derisiveness. In addition, key to developing an integral point of view is discovering the connection of science and spirituality–to experience the awe in both expressions of "spirit" (Adams, 2006).

The ontological inferences from addressing the spiritual intelligence in an integral education are immense. Reality takes on an inclusive nature, a both/and quality as opposed to the either/or dualism that has been engrained in our current educational reality, that we so often take for granted as the way it is. How students relate to one another is more from appreciative inquiry and understanding throughout their education. Epistemologically, knowledge is recognized for its multifaceted quality. All sides are presented. Students are educated to take multiple points of view and experience what it is like to be in the shoes of the other. The whole and the parts are seen in *relationship* with one another. Analysis and synthesis and the subjective and objective brought together yield a different quality of knowledge and understanding and an opening for wisdom to appear. "Wisdom is a quality of 'seeing' and relating to life that reflects an ability to synthesize its disparate aspects. Wisdom mirrors wholeness—as it reveals all sides" (Adams, 2006, p. 353).

Conclusion

What kind of world do you want to live in? When you listen to the news and read papers and magazines, what kind of narratives do you want to represent you and the world you are creating? The world we live in and the future we are living into are up to us. How might your worldview shift to move from ways of being that are separating, isolating and fragmenting yourself and others, to ways of being that are connecting, relating and integrating for yourself and others. What can you do or say or who can you 'be' that will begin unraveling the existing vicious cycles and start creating many more virtuous cycles. Let's own our future together.

Teachings From the Deep South: North-South Contributions to Integral Education

Adrian Villasenor-Galarza[1]

Abstract: The present paper addresses the need to incorporate often ignored perspectives and formulations derived from what I refer to as the “deep south” into the field of integral education as currently practiced at the California Institute of Integra Studies (CIIS), in San Francisco, CA. The deep south, or the metaphorical conglomerate of wisdom ascribed to the global south and associated epistemologies, is used as a broad framework from which I propose, through the exploration of shamanic practices and symbols, the creation of an organizing vertical metaphor, a North–South axis of dialogue. I start with a brief exposition of the one of the main challenges that integral education faces, a cognicentric focus, and proceed to explore alternatives to it by addressing some repressed aspects of the field, the notion of multidimensionality, and the symbol of the *axis mundi*. The paper ends with an invitation for a marriage to take place between the East–West and North–South axes of knowing and learning as an adequate and necessary development for integral education.

Keywords: *Axis mundi*, indigenous wisdom, integral education, multidimensionality, North–South axis.

Introduction

Nowadays, the value of transformative, holistic, and integral approaches to education is slowly being recognized. However, in a society whose standards are dictated largely by the mechanistic paradigm of modernity, it is no mystery that our educational institutions still perpetuate recalcitrant biases based on fragmentary conceptions of self and world. In many spheres of our world—be it political, religious, environmental, or social—the detrimental effects of a fragmentary paradigm are deeply felt, but it’s in our educational systems that it’s actively passed on to future generations.

The concept of the “hidden curriculum,” advanced by Brazilian educator Paulo Freire (1970/2007), sheds light into the functioning of mainstream education. The concept posits that there is no such thing as partial education, meaning there are a number of deep structures guiding and informing the explicit curriculum. Students, mainly unconsciously, pick up a paradigmatic attitude from which their learning is navigated—a habit that spills over to their lives as a whole,

affecting their relations with their bodies, their loved ones, other species, society, and ultimately, the world itself.

The linear demarcation between teacher and student and the mechanistic, flattened, purely objective understanding of the world, dwell at the core of the main challenges that integral education aims at correcting. As Mexican holistic educator Ramon Gallegos Nava (2001) succinctly puts it, “it is not possible anymore to educate human beings with a XVII century industrial scientific paradigm for a sustainable society of the XXI century” (p. 1). Yet, the issue of the kind of hidden values, habits, and ways of being that are implicitly perpetuated by more integral pedagogies, remains. Are there some subtle ways in which unfavorable ways of being are still reproduced in an integral educational setting? If so, what can we do to correct them, to heal them?

Cognicentrism and the Underworld

We can say that integral education is a balancing force that aims at bringing to the surface the wholeness of our humanity. Yet, given the different lineages at work in the integral education community (derived from the work of influential thinkers such as Steiner, Aurobindo, Gebser, Krishnamurti, Montessori, Wilber), a considerable variation and diversity is to be expected, enlarging the range of pedagogical options available and contributing to the resilience of the field. As such, although integral education as a whole agrees on the need to invite all human dimensions into the learning experience, there are at least three broad categories that serve to characterize the efforts of integral educators: mind-centered/intellectualist, bricolage/eclectic, and participatory (Ferrer, Romero & Albareda, 2005). Perhaps rather loosely and in spite of the nuances pertaining to each of the categories, one could say that the determining factor in this classification is the extent to which the pedagogical efforts champion the primacy of the mind and its associated rational-analytical faculties.

The tendency for inflating the role of the rational-analytical mind is widespread in Western education and is intimately connected to the extent to which the holistic nature of integral education can flourish. Often, the powers of the rational mind obscure and ultimately obstruct the exploration and refinement of the variety of intelligences (Gardner, 1983/1993) or developmental lines (Wilber, 2000) that constitute our being (e.g., emotional, somatic, spiritual, imaginal, sexual). As Thartang Tulku (1987) puts it, “Knowledge is not a matter for the head alone, but for the heart and spirit, the body and mind; an adventure for the whole of our human being” (p. 80).

The biased and cognicentric approach present in integral education potentially wounds and cripples the spectrum of our human potential. It’s no wonder why it has been considered one of the most challenging obstacles for engaging in a more genuine integral pedagogical experience (Ferrer, 2003).

Ferrer goes on to say that the cognicentric bias creates a vicious, self-perpetuating circle, since participation of the non-rational dimensions commonly occurs through and is facilitated by the mind. As such, “these human dimensions cannot mature autonomously, and thus the need for their mental or external direction becomes permanently justified” (Ferrer, 2003, p. 26).

A way to tackle the aforementioned cognicentric vicious circle is to resort to the use of a spatial metaphor. For many of us in post-Enlightenment industrialized societies, the seat of rationality sits "up north" somewhere in our brains—Descartes' *res cogitans* or thinking substance, carrying a deep seated assumption that this substance is directly associated with terms such as "real," "truth," and "objective." Alternatively, other ways of knowing—loosely associated with everything the neck down and our creative organs "down south"—are considered non-reliable sources of acquiring knowledge.

At a socio-economic level, "the north" is associated with (over) developed countries and their predominant Eurocentric perspective that enables the distribution of corporate capitalism to the "the south" where economically poorer and marginalized populations are made dependent upon the north. In the south awaits the unconscious shadow of modernity in need of being emancipated, it becomes the mythical underworld. One can say that the first step to take in order to loosen the cognicentric grip in our educational efforts is to journey south to the underworld.

The journey southward is not an adventure to be taken lightly. Different sages and teachers throughout time have associated the downward movement with a process termed by Saint John of the Cross as the "dark night of the soul" (Bache, 2000; May, 2005; Underhill, 1974). Isolation and loneliness pervade the dark night and a sense of disillusionment and lack of direction abounds. Yet, it is deemed as a crucial and necessary journey into wholeness: "[hu]man's task is…to become conscious of the contents that press upward from the unconscious" (Jung, 1989, p. 326). Hillman (1979) explicitly makes of the underworld (Hades) a cornerstone for his approach to all psychological endeavor, alluding to it as "a movement downward and inward, psychologizing ever further into Hades" (p. 208), for it is in Hades where humans find depth and meaning. In relation to education and the cognicentric approach to integral education, it is in the underworld that we find, as long-lost treasures, the repressed dimensions of our being and the possibility of including them in our endeavors.

The journey into the underworld of integral education may certainly be considered an initiation. From a cognicentric approach, the genuine opening to the diversity of knowing present in the "south" appears as an initiatory process in which the ordinary functioning of the mind undergoes a deep transformation. The direct encounter with previously repressed dimensions of non-Eurocentric epistemologies and alternative ways of knowing threatens the very survival of a cognicentric approach. The journey south presents a great heuristic and healing potential that diminishes the great strain that has been allocated to the rational-analytical qualities of the mind, enabling the appearance of a fresh configuration in which all of the human dimensions participate in the acquisition of knowledge.

The focus on the "south" by no means implies that the cognicentric north is evil or wrong. But is in the excess and abuse of one side of the North–South axis that potentially dissociative dynamics are perpetuated in our educational settings.

A dynamic balance and reunion of north and south is needed to gain a fuller access to the gifts that integral education has to offer, as represented in the ancient Incan prophecy of the eagle and the condor. The Incan prophecy beautifully conveys a long awaited reunion of the eagle—the modern, materialistic, technological world of the north—and the condor—the world of the heart, of depth, and connection with nature and spirit.

> We have been waiting five hundred years…now, in this age, when the eagle of the North and the condor of the South fly together, the Earth will awaken. The eagles of the North cannot be free without the condors of the South. Now it's happening...We belong to the evolution of nature in our physical bodies. But we also have a spiritual body that comes from the Sun…a Golden Sun burning with the fire of spiritual light. (Huayta quoted in Monacheshi, 2008, pp. 122-123)

The condor and the eagle, soaring free, cruising the skies, blessing both air and land, represent the heights of the human potential to which the native peoples of the Americas strive for—heart and mind collaborating in the service of integral education.

Multidimensional Education and the *Axis Mundi*

Central to our exploration lies the multiplicity of dimensions of the human learning experience. It follows that a key aspect of an integral education is to foster the activation of our various capacities of knowing and learning without the control and regulation of the mind. This activation resembles an act of surrendering to the flows and rhythms native to the non-rational dimensions. We can learn this surrendering from one of the most ancient and widespread human traditions, shamanism.

The shamans' engagement with the so-called "spirit world" made them, as historian of religion Mircea Eliade (1972) puts it, "technicians of the sacred" and masters of "ecstasy." Entering into ecstasy (Gr. *ekstasis*), shamans, commonly aided by a trance inducing techniques, are able to somehow project their consciousness and traverse mysterious realms of divine and human significance. Through time and direct experience, their journeying, commonly referred to as "shamanic journeying" (Harner, 1990; Ingerman, 2006) made the shamans invaluable repositories of the wisdom to navigate the multiple dimensions of existence.

Shamanic journeying is characterized by a recurrent symbol widely represented as the *axis mundi*: the axis of the cosmos or the world tree. The symbol, known since pre-historical times and found in most of the religious traditions of the world, signifies a passageway for the soul to travel beyond the material dimension as well as for pouring divine energies into existence. It is often depicted as a vertical link and connecting thread between heaven, earth, and the underworld. It takes various shapes including that of a ladder, a column, a mountain, a tree, a staff or a vine.

For the ancient Mayas (as for other Mesoamerican cultures), the *axis mundi* was represented by a cosmic tree named *Yaxkin* from which all life flows, generating the four directions of the cosmos out of its sacred center. In Norse mythology, the cosmic tree goes by the name of *Yggdrasil*, and in the Hindu tradition, the sacred tree *Asvattha* is equated with the Absolute or Brahman. Shamans perceive it as a roadmap, an organizing structure that allows them to move through the different layers of reality, making their travels to celestial and obscure realms possible.

We can see the value of the *axis mundi* for integral education if we invoke again a spatial metaphor. Judie Wexler (2004) proposed that in order to better understand integral education, it was useful to divide it in a horizontal and vertical dimension. The horizontal dimension deals with the ““the way we integrate knowledge” (i.e., content, training, and mental inquiry) and the vertical dimension to “the way we integrate multiple ways of knowing” (i.e., special trainings and multidimensional inquiry)” (Ferrer, Romero, & Albareda, 2005, p. 309). It’s difficult to make a clear-cut demarcation between these dimensions, since it’s possible that they inform and enrich each other through their own strengths and weaknesses. One thing we can say is that the horizontal dimension is still guided by a cognicentric approach, whereas in the vertical dimension, our different intelligences emerge to the foreground, endowing it with a particular importance. For Ferrer, Romero, & Albareda (2005), “the greatest challenge of integral education lies in the facilitation of the vertical dimension of learning: multidimensional inquiry or integration of multiple ways of knowing” (p. 310).

As we have seen, the horizontal dimension of integral education does not deal directly with the multidimensionality of knowing. This dimension in turn promotes a horizontal mode of consciousness in which the ability to integrate different bodies of knowledge is advanced, bypassing the transformative potential of education that stems from being in contact with different dimensions of knowledge. Even more so, it could potentially lead to a disenchanted, fragmented, and flattened perspective of the educational process. As Jung (1955) tells us, “the irresistible tendency to explain everything on physical grounds corresponds to the horizontal development of consciousness in the last four centuries” (p. 177).

This reminds me of Edwin Abbot’s classic novel *Flatland*, in which the main character, the “square,” a two-dimensional being, struggles of making sense of the world after peeking into different orders of reality. It wasn’t until the square undergoes deep transformation that he was able to consciously see that his everyday life was a fragment of a more comprehensive world. He then realized, through his journeys to other dimensions, that he had the ability to enter into contact with those other aspects of reality and participate in them.

The vertical dimension of integral education is, I believe, appropriately represented by the *axis mundi*. As a universal representation of a vertical passage through which the human soul is able to journey and acquire divine knowledge, the *axis mundi* provides an understanding of multidimensionality and the possibility of accessing multiple ways of knowing. Shamans are considered “psychopomps” or soul guides due to their journeying up and down the world tree. The expertise gained through their multiple encounters with the numinous endows them with the ability to serve as mediators and guides between the subtle dimensions of the rich shamanic geography and that of everyday awareness. In our quest for honoring and enacting the different layers of our humanness in our education, we are in need of not only becoming aware of the multiple layers of our existence—as we have seen—but of learning how to access them.

The shaman considers each of the worlds that he or she visits as complete and full of mystery and value in and of themselves. Accordingly, he or she is required to make use of alternative ways of knowing in tune with the nature of the realm in question. The key to learn to access different dimensions of knowledge, as is the case in integral education and shamanism, is to acknowledge that each and every dimension is endowed with its own logic, wisdom, and validity. This multidimensional approach would not only include

> …the intellectual knowing of the mind, but also the emotional and emphatic knowing of the heart, the sensual and somatic knowing of the body, the visionary and intuitive knowing of the soul, as well as any other way of knowing available to human beings (Ferrer, 2002, p. 121)

Shamanic journeying understood as the navigation through, and participation in, the different dimensions of existence, is intimately connected with integral education. The sensibility and expertise that shamanic traditions have developed over thousands of years around their ecstatic capabilities can be of great value for teachers and students alike in search of eliciting multiple ways of knowing and inviting different dimensions to the pedagogical experience. For our purposes, the mysterious realms that the shaman visits can be equated with the multiple “worlds” of our being (i.e., emotional, somatic, spiritual, imaginal, sexual), creating a conscious conduit between, for example, the “somatic world” and its intelligence, and the rest of our being. Because our primary adherence commonly remains with “the cognicentric world,” the journey into the somatic world would create a non-ordinary state of consciousness. Thus, we can say that the skillful surrendering of the cognicentric approach in education can be done by means of shamanic journeying and its central symbol, the *axis mundi*.

The last key insight I would like to derive from the vertical metaphor of the *axis mundi* is that of the “center of the world.” According to Eliade (1961), the *axis mundi* is always found in the center of the world, a “place that is sacred above all” (p. 39), where all spiritual orientation is available to us humans. It is in the center where the sacred manifests in its totality and the divine forces of the cosmos merge with the here and now of our existence. Indigenous traditions around the world refer to the cosmic center as a circle, sometimes represented as “medicine wheels” or “sacred hoops.”

For the Huichol Indians of Mexico, the center of the world, *Teakata*, is where it all ends and where it all begins, it is the heart of the earth and the dwelling place of *Tatewari*, the grandfather fire. The words of Black Elk provide us with a clear understanding of the center as a sacred circle from which the *axis mundi* surges, “The flowering tree was the living center of the hoop....Everything the power of the world does is done in a circle” (in Neihardt, 2008, p. 155). The center is that inconspicuous part within us that a genuine integral education ultimately aims at developing an intimate connection with, a center that mimics the sacredness and interrelatedness of the world at a microcosmic scale.

There are at least three essential ways in which the *axis mundi* and shamanic journeying are of essential importance for integral education. First, they point us to the knowledge of the multiplicity of worlds, their associated states of consciousness, and their accessibility via shamanic journeying. Second, they stress the importance of actively participating in our educational efforts, that is, an integral learning experience becomes fully alive through direct experience. And thirdly, they point to the sacred place or ground that we draw our sustenance from and to which we are all called to “return.” Referred to as the “god within” by the Gnostics, we all carry within us, tattooed on our souls by ancient fires, a sacred circumference, a dwelling of gods and reconnecting principle of divine nature.

Integral Education's Medicine Wheel

We have been exploring some key insights that the "deep south," that is, the metaphorical conglomerate of wisdom ascribed to the global south and associated epistemologies, has to offer to integral education. This exploration has been done largely through the use of a vertical, North–South metaphor. Aware of the great influence that Eastern spiritual teachings have had in creating and advancing the field of integral education—as well as their pivotal role in the revival of spirituality in the West—the metaphor was chosen to lend some necessary attention to the teachings from the South. Although we have merely touched on the wisdom of indigenous and shamanic traditions, the deep south is also conformed by other embodied and earth-centered approaches such as numerous earth-based traditions from around the world and feminist spirituality. Overall, the teachings from the deep south would only aid the growth and maturation of the field of integral education by bringing to balance the East–West dialogue with a North–South one.

Indeed, balance and harmony are key organizing elements present in indigenous cosmologies. The shaman is in charge of maintaining an ongoing dialogue with different beings—plants, rocks, thunder, fire, animals, and the cosmos at large—to secure a dynamic, harmonic balance from which the wellbeing of the community depends. Similar to the Taoist unending dance between yin and yang, we find that in indigenous communities the notion of health is intimately connected to balance and harmony. For example, in Navajo, *hozho* is a word that connotes balance, harmony, and beauty. For the Q'eros people, *ayni* is a principle that is best translated as sacred reciprocity or harmonic exchange and balance. It is the main guiding principle of the Q'eros of today and of the whole ancient Andean tradition. Balance and harmony bring health, and health summons wholeness.

My brief treatment of one of the main shortcomings of integral education as currently practiced at CIIS, cognicentrism, makes it clear that there's an imbalance in need of being addressed. If we assume that this imbalance stemmed from the initial East–West dialogue that largely precipitated the inception of the field, the North–South axis could be seen as a necessary and balancing "medicine." I believe that the tolerance and openness necessary for seriously giving way to the deep south along with its alternative ways of knowing, embodied, feminine, and earth-based epistemologies, in the integral education discourse is present and, to some extent, already taking place. One of the best examples of a more balanced integral engagement is Ferrer's and colleagues' participatory proposal (Ferrer, 2002; Ferrer, 2003; Ferrer, 2008; Ferrer, Romero & Albareda 2005; Ferrer & Sherman, 2008).

Not only would the confluence of the East–West, North–South axes create a more balanced and robust proposal for integral education, but it would bring about a much needed healing between traditions, cultures, and peoples, slowly moving toward actualizing the integral vision of education.

The resultant "integral education medicine wheel" would bring us closer to restore education to the status of a wisdom tradition. How amazing it would be for both students and teachers to enter together into a multidimensional, integral, tolerant, and diverse journey of learning and transformation. Imagine education as a revolutionary act in which the boundaries between school and life become blurred and, ultimately, we become students and teachers of the art of living. I strongly believe that this is possible. How amazing it would be to create and participate in a multidimensional model of education that leads us into healing and liberation, like a symphony beyond the mind.

No Ontological Leaps:
A Primer on Scientific Materialism

Christian de Quincey[1]

Abstract: When the issue is intelligence in nature, arguments about whether science supports neo-Darwinian theory or intelligent design miss the point. The details of evolution or the structure of the brain are irrelevant because biology and neuroscience have nothing to say about consciousness. Science informs us only about the *physical* world. However, consciousness/mind/intelligence is *non-physical*, and no amount of evolution or complexity of purely physical processes could ever produce anything non-physical. There are no ontological jumps. You don't get something from nothing—or, more precisely, you don't get "no-thing" from anything. How, then, do we account for the fact that consciousness exists in an otherwise physical universe? It all comes down to our basic metaphysical beliefs.

Keywords: Consciousness, dualism, emanation, emergence, idealism, interaction, materialism, ontology, panpsychism, performative contradiction, philosophy of mind.

> Every truth passes through three stages before it is recognized. In the first place it is ridiculed. In the second it is opposed. In the third it is regarded as self-evident. — *Arthur Schopenhauer*

My focus here is whether evolutionary science—or, more accurately, its philosophical underpinnings—can account for the experiential fact that consciousness exists in an otherwise physical universe.

Looking for evidence of intelligence or intention in nature by arguing over details in the data or theory of evolution is a fool's errand. It is an impossible dream, just like searching for the location of mind in the brain. Getting sidetracked in the minutiae of biological or paleontological evidence misses the simple fact that no amount (or lack) of physical evidence can inform us about non-physical mind or consciousness.

Promissory Materialism

The standard, almost unquestioned, belief in mainstream science and philosophy today is that materialism (i.e., neuroscience) can, or one day will, explain how mind could emerge from

SOME RIGHTS RESERVED

wholly mindless matter. However, despite this great faith in the explanatory power of neuroscience, the fact remains that materialism completely fails to account for such a "miracle." This belief that mind can be reduced to, or explained by, physical events is merely a statement of faith, not science—because not the slightest trace of empirical evidence or rational argument supports or explains such emergence. I lay out the details in my book *Radical Nature* (de Quincey, 2010). Exposing scientific faith in the miracle of ontological emergence typically requires a return to "Metaphysics 101"—an attempt to get people to think through more carefully the implications of their basic assumptions about the fundamental nature of reality.

I'd like to make something very clear: I am no less free of basic metaphysical assumptions than anyone in the materialist camp. We all, necessarily, begin any contemplation or investigation of the world with some set of fundamental metaphysical assumptions. That's a given. It's unavoidable.

What good philosophy does (and good science should do), however, is lay bare those assumptions, and examine them to see (a) if they are internally coherent (rationalism), and (b) if they are consistent with the actual world revealed through experience (empiricism).

Then we ask: Which set of fundamental metaphysical assumptions best "cashes out"—which metaphysical propositions best fit what we actually know about the world? What, in short, is the most "likely story"?

I base my case for "radical naturalism" (panpsychism) on a metaphysical assumption best summed up colloquially as "nothing comes from nothing" or "you can't get something from nothing"—no free ontological lunches. If you start with a mindless universe, then that's all you'd ever get.

Four Major Worldviews

I have spent a career in philosophy focused on examining and evaluating the various alternative metaphysical starting points to see which one best accounts for the fact that we are embodied beings with consciousness. Technically, in philosophy, it's called "the mind-body" problem. Despite multiple variations, all ontological positions on the mind-body issue resolve into just four alternatives: dualism, materialism, idealism, and panpsychism. All, except panpsychism, fail the two-part test outlined above: rational coherence, and consistency with experience.

Dualism

This claims that the fundamental nature of reality consists of two radically different and separate kinds of substance (extended matter and non-extended mind), and is a non-starter. Notoriously, it runs into the hoary problem of interaction. How could two radically different and separate substances ever come together and influence each other? Nobody has succeeded in explaining that. In short, it would require some kind of miracle.

Materialism

Recognizing the insuperable problem facing dualism, materialism lops off half of reality and claims that the ultimate nature of existence is purely physical (energy/matter). That's one way to avoid the interaction problem. It's an understandable and pragmatic strategy, and it has worked well as a foundation for exploring the physical aspects of the natural world. But it fails utterly to explain the undeniable fact of experience, of consciousness itself. Given its starting point, materialism is forced to claim that consciousness must have "emerged" from purely non-conscious precursors. But such emergence is unaccounted for (and unaccountable) either through science or philosophy.

In fact, "emergence" of mind from wholly mindless matter would also require a miracle—and miracles (supernatural interventions) are precisely what materialism rules out. This leaves materialism in an embarrassingly awkward position: in order to be true, it must be false! Unaware of this lurking logical bomb, materialists continue to believe that science can explain how consciousness emerged from purely mindless matter. Of course, science can do nothing of the sort. Neither science nor philosophy can even begin to explain how wholly physical, objective ingredients could ever produce non-physical, subjective minds.

Idealism

This is the direct opposite of materialism. It claims that the ultimate nature of reality is pure spirit (consciousness/mind) and that what we call "matter" is either (a) an illusion, or (b) something that "emanates" from pure spirit. The notion that real matter could "emanate" from pure spirit is just as incoherent as the materialist conceit that mind could "emerge" from wholly mindless matter. Such an ontological "jump" would also require a miracle. (However, the possibility of miracles is not such a problem for idealists—for whom everything is ultimately supernatural). But miracles have no place in science or philosophy because they explain nothing. Miracles are gaps in explanation.

That leaves us with the second option called "maya idealism." Here, the reality of matter is denied, and assumed to be nothing but an "illusion," a concoction in consciousness. This position is logically irrefutable. (It is impossible to step outside mind to know or indicate a reality beyond mind. Everything known and knowable necessarily occurs in some mind.) However, even though logically unproblematic, maya idealism runs headlong into another kind of problem—a performative contradiction. Everyone who claims that matter is illusory necessarily lives (performs, acts, behaves) in the world as though matter is real. Every idealist I have met eats food, drinks water, wears clothes, lives in houses, avoids cars on the freeway, doesn't walk through walls . . . you get the idea. In short, maya idealists don't (and can't) walk their talk. That's a pragmatic problem, even if it isn't a logical one.

As I explored and analyzed the implications of these three ontological worldviews, they all turned out to be deeply problematic one way or another. Either they required a miracle (unacceptable if we want to explain an event) or their claim is contradicted by how they act. That leaves one final alternative . . .

Panpsychism

This worldview claims that ultimate reality is both physical and non-physical (it consists of objective matter and subjective mind) and that mind and matter are inseparable. Mind and matter always go together—all the way down.

Although acknowledging the existence of two ontological types (physical matter/energy and non-physical mind/consciousness), panpsychism differs from ontological dualism because it denies that mind and matter are separate or separable. In fact, of the four major worldviews, panpsychism alone qualifies as a form of nondual dualism or a dual-aspect monism. Here, ultimate reality consists of a single, inseparable, nature—sentient energy. However, this single ultimate has a dual-aspect interior subjectivity and external objectivity. In short, the Creative Ultimate consists of intrinsically sentient energy. Matter itself tingles with the spark of spirit.

Summarizing the central idea of panpsychism: *Consciousness is the intrinsic capacity of matter/energy to feel, know, and purposefully direct itself.*

This native ability of matter/energy to purposefully direct itself accounts for the inherent exploratory drive in evolution. In fact, what we call “evolution” is the grand adventure of matter/energy exploring its own potentials—giving rise to the blooming, buzzing symphony of species that grace our planet (and, no doubt, countless other planets and galaxies, too). Yes, evolution also proceeds through physical processes of unpredictable mutations and natural selection. But these physical changes are guided from within by a native “urge” or “aim” operating within nature itself at all levels.

A major problem facing this panpsychist ontology is that it seems so counterintuitive: “Are you seriously asking me to believe that even non-living things such as molecules and atoms have consciousness?” It seems incredible. But the idea of intrinsically sentient matter is boggling only to minds that have, mostly unconsciously, assumed the materialist metaphysic that matter is intrinsically “dead,” vacuous, or insentient. But why start with that assumption—given the one undeniable fact we can all be certain of: Consciousness exists. Descartes, bless his heart, at least got that one right.

Materialism simply cannot account for the fact that the universe contains sentient embodied beings (each of us knows this to be true at least in our own case).

When we realize that the “interaction” of separate mind and matter is untenable, and that there is no way to explain how mind could “emerge” from mindless matter or how real matter could “emanate” from pure mind, and if we wish to avoid a stark “performative contradiction,” we are left with a single alternative: The only foundational metaphysical assumption that “cashes out” and accounts for the world as we actually experience it is that both matter and mind are real and that neither is reducible to the other—panpsychism.

Something from Nothing?

Now I know that for many, perhaps most, people (especially scientists and philosophers) this can be a hard metaphysical nut to swallow. However, given the alternatives, panpsychism turns out to be the most “likely story.”

After all, other than a mental habit or intellectual prejudice, why would anyone automatically reject the idea that sentience or consciousness could be built into the very fabric of the universe? Think about that.

Look, as humans we experience ourselves as conscious embodied beings. How can we account for that fact? We are made of cells, molecules, atoms, and subatomic particles—that’s our embodiment. However, we also feel and experience and make choices. Given the failure of any of the other worldviews to account for these two fundamental facts, the only option is to assume that whatever we are made of (cells, molecules, atoms, etc.) must also have some form or degree of consciousness, too—all the way down. Otherwise, we face the problem of deciding where to place the “consciousness cut.” Anywhere you decide beyond this point, there’s no sentience, the same problem shows up over and over. If, for instance, you decide that consciousness could not exist in non-living things like atoms and molecules you are then at a loss to explain how living beings became conscious. How did subjectivity emerge from wholly objective things? Ontological jumps don’t happen without miracles. Quite simply: You can’t get something from nothing.

A Likely Story

Okay, that’s the general argument. Now to the specifics: Critics characterize panpsychism as an “untenable assumption.” By now, I hope it is clear that, on the contrary, panpsychism turns out to be the only tenable assumption. For example, one critic objected: “[panpsychism entails that] every particle of sand is sentient and has experience. I do not believe that that is the case. Sentience and experience, on the, by now, standard evolutionary account, have emerged gradually over millions of years, and are characteristic of complex organisms. A structural complexity of a certain kind is required for sentience or experience to exist.” (Barglow, 2010, personal communication).

Actually, panpsychism does not entail that “every particle of sand is sentient and has experience.” This objection misses a crucial distinction between “heaps” and “wholes,” between “aggregates” and “individuals.” I don’t have the space to go into that here, but suffice to say that my views entail that the individual molecules in each grain of sand have some form of sentience, even though the sand grain, or a rock, does not.

Critics who find it difficult to accept that something as small and as simple as a grain of sand could have sentience are even less likely to accept the notion of sentience in molecules. My point is that we are not made of grains of sand, but we are made of molecules and we are sentient—therefore it follows that whatever we are made of must be sentient, too (remember there can be no “consciousness cut” without an ontological jump).

Given their faith in emergence, it is understandable that materialists are not troubled by the idea of a consciousness cut—a level of reality below which (or stage in evolution before which) mind was entirely absent from nature. Therefore, they assert, mind must have emerged from wholly mindless precursors. After all, they claim, we know from numerous other physical processes that emergence happens all the time. But that belief is based on faulty assumptions about the nature of emergence. The claim that sentience and experience have "emerged gradually over millions of years" and that this is explained by the "standard evolutionary account" is simply not true. Not a single scientific paper or theory exists that even begins to explain how sentience emerged. The plain fact is that evolutionary biology has literally nothing to say about the emergence of mind or consciousness. Zero. Zilch. Evolutionary neuroscience deals only with the development of nervous systems and brains—physical systems. And then materialists assume that the evolution of complex neural systems "must have" produced minds. Not one iota of scientific evidence supports that view—for the very simple reason that science deals only with objective, physical, measurable processes.

As long as science relies on a methodology of sensory empiricism, itself rooted in the metaphysics of materialism, then science will remain utterly in the dark about consciousness. The best it can do is produce data about neural correlates of consciousness, but can say nothing about consciousness itself. When materialists dispute this, I challenge them to produce a single scientific datum about the miraculous moment when previously non-conscious molecules or cells jumped the ontological gap and became conscious. I am one-hundred percent confident this won't happen—ever.

The claim that "structural complexity of a certain kind is required for sentience or experience to exist" is nothing more than an unfounded assumption. What is that special complexity, and how does any complex arrangement of purely physical ingredients explain the existence (or "emergence") of non-physical consciousness or sentience?

Seemingly unaware of logical bomb ticking away in the heart of materialism, scientific materialists think that science has explained the steps in evolution that led from "dead" insentient matter to feeling, thinking, choosing beings like us. But they never provide any evidence or offer any explanation for how this miracle could have occurred (they can't).

Instead, they try to deny any ontological difference between mind and matter. It's the only move available to materialists who want to avoid the ontological gap. But that kind of simple ontological reductionism flies in the face of our own direct experience.

Mind the Gap

Barglow objected:

> [de Quincey] speaks of "the 'ontological gap' between two radically different kinds of reality." But notice that it is the author himself here who is postulating a radical conceptual dualism. "Consciousness," he says, "is notoriously non-physical (you cannot observe or measure it)." I don't find this radical physical/non-physical distinction tenable. There are so many ways in which consciousness and the domain of mental phenomena are bound up

> with physical phenomena, and are indeed observable . . . (Barglow, 2010, personal communication)

Here, Barglow clearly misunderstands me when he says I speak of "the ontological gap between two radically different kinds of reality." While there is a radical difference or distinction between physical and non-physical (between matter and mind), there is no "gap." I emphasize this over and over in my work: Consciousness and energy always go together. In panpsychism, mind and matter are inseparable, while remaining ontologically distinct. The "gap" I refer to shows up in materialism when scientists or philosophers try (but fail) to explain how one kind of reality (nonphysical consciousness) emerges from a radically different kind of reality (physical matter). Barglow's next move, typical of materialists, is to question the distinction between "physical" and "non-physical," saying that he finds it "untenable"—implying that only what is physical is real.

Following other materialists such as Daniel Dennett, Barglow is here denying that anything non-physical exists, and, therefore, that consciousness is physical. When materialists make that move (very common), I invite them to explain how any of the qualities (or quantities or complexity) of physical objects could ever account for the qualities of consciousness (qualia) so familiar to each of us—qualities such as subjectivity, feeling, awareness, intentionality, purpose, meaning, value, etc. etc. Any attempt to characterize consciousness as physical completely misses the key experiential first-person essence of what philosopher Thomas Nagel famously referred to as "what it feels like to be."

Unity is Not Identity

Barglow (2010, personal communication) confuses unity with identity. He says: "There are so many ways in which consciousness and the domain of mental phenomena are bound up with physical phenomena." Yes, of course. But so what? The fact that mind is "bound up with" matter in no way implies that mind is nothing but matter. That is just sloppy thinking. Imagine holding a rubber ball in your hand. Now try to separate the shape from the substance. Of course, you can't. However, when you twist or squeeze the ball the shape changes yet the substance remains exactly the same. Clearly if the shape changes and the substance doesn't, they cannot be identical. Like shape and substance, mind and matter are inseparably unified but are always distinct.

From the perspective of panpsychism, mind and matter always go together—they form a unity—but they are not identical. Even though physical and non-physical are inseparable, they remain distinct. You need only pay attention to your own daily experience to confirm this. You observe (with your senses) that you and others have a body (with extension and volume in space). You also experience your own body from "within." You have feelings, thoughts, and make choices—and none of these can be located in space or explained in terms of physical events in your body. The objective, observable, existence of your body (physical) is radically different from your subjective non-observable conscious experience (non-physical). It doesn't take a philosophical genius to notice the "radical distinction" between body and mind, between physical and nonphysical.

When materialists deny any such distinction between objective physical existence and subjective nonphysical existence, they are simply not paying attention. They are too caught up in their own abstract thoughts about consciousness instead of actually experiencing their experience.

Barglow (2010, personal communication) had more to say; my responses are brief, as follows.

Barglow: "The scientific evolutionary hypothesis is that consciousness has emerged as organized matter. A sentient, experiencing being is one that is physically organized in a certain way."

de Quincey: "This just begs the question: How on Earth (or anywhere else) can mere physical organization achieve this miracle and produce sentient experiencing beings? This claim is made over and over without any evidence to back it up. And what is this mysterious 'certain way' in which physical complexity is organized to make minds?"

Barglow: "The evolutionary process of this emergence took place over many millions of years. No 'complete mystery' here."

de Quincey: "Really? Then please provide a complete (or even incomplete) step-by-step explanation—especially an account of what happened at the moment the miracle occurred." (Barglow, 2010, personal communication).

Barglow goes on to cite the evolution of photo-sensitivity—from primitive chemical reactions to the development of the eye—as an example of emergence. But this (like the old and tired example of liquid water emerging from hydrogen and oxygen gases) is a familiar non-sequitur. Yes, *physical* emergence does occur in *physical* systems. No mystery there. However, descriptions of one physical process giving rise to some other physical process is radically different from explaining how a physical process could give rise to some *non-physical* product. Relying on examples of physical emergence completely misses the point, and demonstrates a profound misunderstanding about the nature of consciousness—its essential subjectivity.

Conclusion

Let me summarize the main points:

1. Arguing over details in evolutionary theory—about whether species developed only through mutations and natural selection or if some creative intelligence also guides the process—is pointless. No amount of biological data will ever illuminate the relationship between consciousness and the physical world.
2. The role of consciousness in evolution (biological or cosmological) is not a scientific issue, it is philosophical. As long as scientific methodology relies on sensory empiricism as the only valid way to gather data, science will forever remain in the dark about consciousness.
3. The senses can detect only physical objects. Consciousness is not a physical object—it is the non-physical subject that knows about physical objects.

4. The mind-body problem is conceptual, not empirical—both the problem and its resolution depend on how we organize our ideas.
5. Using the criteria of conceptual coherence, consistency, and adequacy, we can evaluate competing theories or metaphysical worldviews that attempt to explain the "hard problem"—how consciousness exists in an otherwise physical universe.
6. Of the four major worldviews—dualism, materialism, idealism, and panpsychism—only one satisfies the criteria of logical coherence and adequacy. Only one avoids falling into a fatal explanatory gap by not requiring some kind of supernatural miracle and does not contradict our direct experience as embodied sentient beings. No logical impasse or ontological leap, and no performative contradiction.
7. When theories involving "interaction," "emergence," "emanation," or a "performative contradiction" run aground, by a process of elimination we are left with the option of "consciousness all the way down" as the most likely story—even if at first glance it strikes us as counterintuitive. The foundational metaphysical assumption that best "cashes out" by accounting for the facts of experience and embodiment is panpsychism.

I'll end as I began with the percipient words of German philosopher Arthur Schopenhauer:

> "Every truth passes through three stages before it is recognized. In the first place it is ridiculed. In the second, it is opposed. In the third it is regarded as self-evident." (quoted in de Quincey, 2010)

Where are we now?

The Union of Spirit and Matter: Science, Consciousness, and a Life Divine

Lynda Lester[1]

Abstract: The once unbridgeable chasm between spirit and matter is closing. While the scientific method and scientific materialism have brought untold benefits to humanity, quantum physics has changed our view of matter as solid, objective, and obvious to a view that is more complex and which includes the possibility that consciousness has a part in manifesting reality. This shift mirrors Sri Aurobindo's integral philosophy, which states that the universe is a manifestation of consciousness. This manifestation occurs through a process of involution followed by evolution, the next step of which is the emergence of a suprahumanity whose native state of consciousness will be supramental. Interestingly, some of Mother Mirra Alfassa's experiences in bringing supramental consciousness into her body bear similarities to the discoveries of quantum physics. Unlike previous spiritual realizations, the supramental realization has the power to unify spirit and matter and usher in a life divine on earth.

Keywords: Consciousness, evolution, involution, integral philosophy, integral yoga, Mother Mirra Alfassa, quantum physics, science, singularity, spirituality, Sri Aurobindo, supermind.

Introduction

Through the ages, spirit and matter have been seen as absolute opposites: spirit as ethereal, immaterial, ineffable; matter as objective, solid, and obvious. Both have been thought to be the ultimate reality, both have inspired humanity, and the chasm between them has been called unbridgeable.

But Sri Aurobindo and Mirra Alfassa (more commonly known as the Mother), two great spiritual teachers of the 20th century, thought otherwise. Their ideal was to join the heights and depths together to bring about a spiritual transformation—here, on earth, in the conditions of the material universe. This transformation wouldn't be a change of life into something purely subtle where, e.g., evolved beings ascend into light bodies and disappear from the physical plane. It would be an integral transformation that would not cast away the energies and capacities of matter, but bring out its hidden possibilities and innate divinity so that the spiritual summits and

the material base of existence would be united in a divine life on earth (Sri Aurobindo, 1998, p. 522).

Spirit vs. Matter

A long tradition exists of religious teachings that urge seekers to shun the profane world and prepare for a heavenly afterlife, or to stop reincarnating and head for Nirvana. Sri Aurobindo notes that this revolt of spirit against matter has influenced the Indian mind for the last 2,000 years:

> . . . the general conception of existence has been permeated with the Buddhistic theory of the chain of Karma and with the consequent antimony of bondage and liberation, bondage by birth, liberation by cessation from birth. Therefore all voices are joined in one great consensus that not in this world of the dualities can there be our kingdom of heaven, but beyond, whether in the joys of the eternal Vrindavan or the high beatitude of Brahmaloka, beyond all manifestations in some ineffable Nirvana or where all separate experience is lost in the featureless unity of the indefinable Existence. And through many centuries a great army of shining witnesses, saints and teachers . . . have borne always the same witness and swelled always the same lofty and distant appeal—renunciation the sole path of knowledge, acceptation of physical life the act of the ignorant, cessation from birth the right use of human birth, the call of the Spirit, the recoil from Matter. (Sri Aurobindo, 2005, pp. 26–27)

Of late the opposite tradition has dominated in the West, where a spirit-denying materialism…

> insists on Matter as a reality, the relative world as the sole thing of which we can in some sort be sure and the Beyond as wholly unknowable, if not indeed non-existent, a dream of the mind, an abstraction of Thought divorcing itself from reality. (Sri Aurobindo, 2005, p. 20)

As both a spiritual practitioner and a writer for a national science laboratory, I have experienced both sides of the divide.

The World According to Science

At the National Center for Atmospheric Research (NCAR), a research laboratory in Boulder, Colorado, where geoscientists study the earth, oceans, clouds, and sun using blazingly fast supercomputers, I worked for 16 years in the field of scientific computing. My colleagues, holding advanced degrees in math, physics, and computer science, exhibited bemused skepticism during lunchtime conversations that turned to "higher consciousness." This was to be expected. Firstly, because by default, humans always associate the real with the materially perceptible. Our physical senses cannot perceive anything immaterial—though we have other senses that can (Sri Aurobindo, 2005, p. 21). But secondly, at a research laboratory like NCAR it's not the world within, but the world without that matters. The purpose of science is to gain knowledge about the processes of nature—in this case, atmospheric processes. What's important here is to measure and analyze data; to develop testable hypotheses and make accurate predictions; to conduct experiments and share results with other scientists, who replicate those results—or challenge them if they're wrong or incomplete; and of course to use mathematical tools to quantify and solve problems.

This objective, empirical, methodical approach to knowledge is called the scientific method. It has fostered an age of rationality, brought tremendous technological progress to society, and resulted in untold benefits for humanity. It has also resulted in a materialistic way of thinking that, due to its tremendous success in widening our understanding, has spread throughout much of the world and strongly shaped the modern mind.

It is important to remember that when this way of thinking first appeared in Europe in the 1600s, it was revolutionary. Religion was the sole arbiter of truth and people were tried for heresy for saying that the earth moved around the sun.

Sri Aurobindo says that the brief period of rationalistic materialism the world has been going through has helped humanity a great deal—it has swept away irrational dogmas, perverting superstitions, and misleading imaginations. Advancing knowledge, he says, should be based on a clear, pure, and disciplined intellect—and as human consciousness evolves toward higher levels, it's necessary sometimes to return to sensible fact, to the concrete realities of the physical world (Sri Aurobindo, 2005, pp. 12–13).

> It even may be said that the supraphysical can only be really mastered in its fullness—to its heights we can always reach—when we keep our feet firmly on the physical. . . . And it is certainly the fact that the wider we extend and the surer we make our knowledge of the physical world, the wider and surer becomes our foundation for the higher knowledge, even for the highest, even for the Brahmavidya. (Sri Aurobindo, 2005, p. 14)

Anomalies and Contraindications

It's interesting, however, that he calls our current age a "brief" period of rationalistic materialism. If that's true, and if the materialistic paradigm is not the sole truth of things, certain anomalies and contraindications might start to appear suggesting that this view, while valid for certain purposes, may not be the complete picture. That indeed, has been the case, starting around the end of the 19th century.

At that time, scientists had a picture of the universe they thought was nearly complete (Walker, 2000, p. 24). It was based on the Newton's laws of motion, Maxwell's equations for electricity and magnetism, and the laws of thermodynamics (Orzel, 2009, p. 231). In this view all things are made of matter, all things that happen are the result of physical interactions, reality is objective and "out there," and mind and consciousness are irrelevant.

Then in 1905 Einstein revolutionized the understanding of matter, energy, space, and time with his special theory of relativity. He showed that mass, the very substance of an object, is convertible to energy, and that space and time are elastic, depending on your point of view. This was the first scientific indication that physical reality depends in some way on the observer (Walker, 2000, pp. 37–41).

Meanwhile, Max Planck discovered that light seems to be radiated and absorbed in spurts that release packets of energy called quanta (Walker, 2000, p. 43). He found this quite perplexing, because scientists could demonstrate the opposite—that light was a spread-out wave. But Einstein liked Planck's idea, and five years later proposed that light itself is a stream of discrete particles. This laid the groundwork for a brand new kind of physics: quantum theory.

The New Physics

By the 1920s, physicists realized that photons, protons, electrons, atoms, molecules, all the tiniest components of matter, behave sometimes like particles but sometimes like waves of energy. This seemed impossible: how could a photon, for example, be both a tiny particle and a spread-out electromagnetic wave? Experiments proved it, however, and as scientists developed the math to deal with the strange new problem of wave-particle duality, they saw that their solutions had created a newer and deeper mystery: the measurement problem (Walker, 2000, p. 49).

A quantum particle is mathematically described in terms of a probability wave or "wave function." This means that the particle hovers in a sort of superposition of all possible states and doesn't have a definite location, momentum, or even a discrete existence until it is observed or measured, at which point the wave function collapses and the particle takes on distinct, objective properties. No one has been able to figure out how this transition from probability to concrete reality takes place, but in some way the observer—the person who designs and conducts the experiment, who takes the measurement—seems to play a key role in bringing fuzzy quantum particles into structured form (Wallace, 2007, pp. vii–viii).

This would seem to suggest that mind or consciousness plays a key role in materializing reality. However, this is such an astounding idea that it's widely rejected by physicists, who want nothing to do with consciousness, many of whom are still today striving to find alternative explanations for the collapse of the wave function.

Some decide the best course is to not spend a lot of time thinking about it—their job is physics, not metaphysics, so they simply use the equations, which work, and concentrate on pragmatic results. This approach has been called "Shut up and calculate!" (Mermin, 2004).

A Profound Discovery

Meanwhile, there's yet another revelation that's come from quantum theory, and this one is the most astonishing of all. Newtonian physics sees the world as consisting of independent, separate objects that interact with each other locally, like a pool cue and a billiard ball, through physical influences that cannot exceed the speed of light.

Early in the development of quantum theory, however, scientists became aware of something called quantum entanglement. This happens when two particles are associated or entangled with each other so that measuring one instantly determines the state of the other. Einstein realized that if the two particles were far enough apart, they‘d have to communicate faster than the speed of light. He called this “spooky action at a distance,” hated it, and thought that because it was predicted by quantum theory, there was something wrong with quantum theory (Schwartz & Begley, 2002, p. 346).

In fact, there wasn’t. In 1964 it was proven that no matter how far apart two entangled particles are, even halfway across the universe, they do influence each other instantly—in no time at all, outside of time. This nonlocal influencing is not subject to the speed of light, does not diminish with distance, and links one location to another without crossing space, without decay, without delay (Herbert, 1985).

Physicist Henry Stapp calls this “the most profound discovery of science” (Schwartz & Begley, 2002, p. 343), because it shows that the old view of a clockwork universe, where all objects are separate and interact only at the local level through material processes that obey the laws of classical physics, is not completely true. Rather, it shows that underlying the local reality of objective, separate objects and phenomena, there’s a nonlocal reality in which nothing is separate and everything is connected.

A More Intimate Knowledge of Self and World

So quantum physics has taken us from a solely materialistic view of the world in which matter is solid, forces are physical, objects are separate, reality is objective, and what we perceive with the outer senses is what’s real to a view considerably more subtle, complex, and multilayered in which matter is energy, time and space are relative, particles are waves, objects don’t exist until they are observed, entangled bits of matter communicate faster than light—and in which consciousness may just possibly have a part.

Thus science, in its search to find the reality of matter, has brought us to the door of the immaterial—a door that opens on enormous vistas of the future, for Sri Aurobindo says that since the soul of science is its search for knowledge, as it reaches the borders of the supraphysical, its very rush will carry it onward. The success it’s had with the visible world is just a hint of what it could bring to the exploration of what lies beyond (Sri Aurobindo, 2005, p. 16).

Meanwhile, according to Sri Aurobindo, three things will remain from the centuries of scientific materialism: the truth of the physical world and its importance, the scientific method of knowledge, and the importance of earth life and the human endeavor. These will stay, he says, but be transformed in the light of a vaster and more intimate knowledge of self and world (Sri Aurobindo, 1998, p. 195).

The World According to Consciousness

We just saw that according to quantum theory, the discrete existence of particles apparently depends on observation or measurement, that is, on there being a conscious observer—which seems to imply that consciousness plays some part in creating material reality. This doesn’t make sense if consciousness is an incidental byproduct of matter. As Nobel physicist Eugene Wigner notes, if the atoms in your brain produce your consciousness, but your consciousness somehow brings those very atoms into existence, that's a paradox (Schwartz & Begley, 2002, p. 283).

It's a paradox, however, that doesn't exist for Sri Aurobindo. Drawing from the wisdom and experience of Indian yoga—which is its own kind of science—he says that behind and beyond the appearances of the universe and involved in every particle of the universe, there's an Omnipresent Reality that is at once an unknowable, indefinable, featureless Absolute and the source of all things and determinations.

This Omnipresent Reality puts forth the universe by the power of what might be called its universal intelligence, which is basically another word for consciousness; and that consciousness is *the* fundamental thing in existence. It extends from the supreme spiritual heights down through the material world in a continuous spectrum that has different grades or levels. Sri Aurobindo calls these levels planes of consciousness, and they're the infrastructure on which the universe is built. It is the gradual precipitation of consciousness through its various planes that manifests the universe.

This process starts at the summits of being with *sachchidananda,* a transcendent and unmanifest plane of infinite existence, infinite consciousness-force, and infinite delight. Emerging from sachchidananda is the supermind, or supramental, a vast unity consciousness that embraces both infinite oneness and infinite diversity, and which begins to physically manifest the universe.

Out of supermind comes the plane of universal mind. Mind is the power of consciousness to divide things into parts, to measure and limit; the role of mind is to translate infinity into the terms of the finite (Sri Aurobindo, 2005, pp. 173–174). Then comes life, a power of vitality and energy; and finally matter, which is the ultimate division of consciousness into tiny bits. Thus, according to Sri Aurobindo, it is consciousness precipitating downward through its various planes that manifests the universe. If we accept this point of view, we see that because matter derives from life, and life derives from mind, ultimately, mind is the cause of atomic existence (Sri Aurobindo, 2005, p. 252).

This may sound familiar, for quantum physics also indicates that somehow (and most inexplicably), mind brings quantum particles into existence. We will return to this idea shortly.

Voluntary Involution

First, however, let's examine the precipitation of consciousness downward through its various modes or planes. Sri Aurobindo calls this process *involution,* and it's a process by which consciousness gradually limits itself by focusing on a particular aspect of reality to the exclusion of others. This is actually a power consciousness has: the power of exclusive concentration. (We experience the same thing when we become utterly absorbed in reading a book and lose track of everything around us.) With involution, consciousness becomes more and more involved with what it is doing, until eventually it becomes so involved that it forgets itself in the oblivion of matter (Sri Aurobindo, 2005, pp. 604–610).

We might ask why consciousness would want to do that; what was it thinking? Many spiritual teachings say it was thinking delusionally—the physical world is a deception of *maya,* or at the very least a catastrophic fall from grace. But Sri Aurobindo says, no—without this exclusive concentration of consciousness, manifestation would be limited to the higher worlds— or to a cosmos that's static and unchangeable.

The Purpose of the Universe

Involution was the necessary basis for individuation—to protect the individual from the largeness of infinity so that behind that defense an individuality could be worked out in time and space in order that consciousness could realize its own delight,[2] not just in the undifferentiated, supracosmic realms, but cosmically and individually and in infinite multiplicity; so that it could experience delight to the smallest and most precise degree—fine-grained delight, objectified, intimate, infinitely varied and particular; dynamic delight of becoming that can't be experienced in the transcendent beyond. There is a purpose to this universe, Sri Aurobindo says, and the purpose is to materialize delight (Sri Aurobindo, 2005, p. 612).

It may not look like that to us ordinary beings in the physical world, and that is, firstly, because due to the exclusive concentration of consciousness, we are superficially unaware that in our true nature we are the infinite consciousness. Of course, the remedy for that is to become aware, which is the reason we do yoga (Sri Aurobindo, 2005, p. 615).But secondly, this materialization of delight is a long cosmic process, an unfolding, and it's not yet complete; we can see that just by looking at the world today. On the other hand, this very unfolding is its own kind of delight. Sri Aurobindo says there's a joy that's impossible in the higher planes— the joy of discovery, which is one of the greatest joys of conscious being (Sri Aurobindo, 2005, p. 428).

Sri Aurobindo says that evolution is just such a progressive revelation, taking place in geologic time and on a cosmic scale: a progressive revelation of the consciousness that involved itself in matter and which is now awakening, step by step, to the miracle of its infinite being.

Meanwhile, we and all the many who come into this world are in essence one with that underlying consciousness and so are willing participants in that joy of self-discovery. We're drawn into the world for the very sake of the soul's adventure—for what Sri Aurobindo calls "the adventure of consciousness and joy" (Sri Aurobindo, 1997, p 2).

A Change Beyond Imagining

Just to clarify, evolution is not the opposite of involution. If it were, as we evolved we would drop our bodies, drop our life energy, drop our mentality, and eventually return to the featureless Absolute. Evolution is something else—the gradual development *in matter* of material forms that increasingly express higher, more subtle, and more powerful modes of consciousness. Life is the first step of that evolution. Mind is the second step. Now nature is about to take a third great evolutionary step, developing out of humanity a supra-humanity or even a new species whose native mode of consciousness will be supramental. We saw this supramental consciousness before during the involution, when supermind put forth from itself the universe. Now we're seeing it from the other side of evolution. This is mind-boggling, for it means that those who make the evolutionary transition will possess that supramental consciousness while materially embodied—and possess the infinite existence and bliss of sachchidananda, the highest term of the supermind, as well.

---

[2] In its ultimate essence (sachchidananda), consciousness is one with existence and delight.

We hear the word "singularity" a lot these days, usually in the context of a technological singularity, superhuman intelligence, the end of the Mayan calendar, the year 2012. But this is a singularity beyond singularities; this will be a change beyond imagining. Because when we pass through the barrier that separates mind from supermind, we'll retain physical bodies but leave behind the divided, fragmented world of ordinary mental perception and regain identity with Omnipresent Reality.

Physicists are searching for a unified field theory, but this will truly be the unified field, for supermind is a unity consciousness—it unifies and embraces; e.g., the infinite and the finite; oneness and diversity; immutable silence and dynamic movement; personality and impersonality; the individual, the cosmic, and the transcendent. It is also an oceanic, global consciousness of irresistible harmony and a compelling force of truth and beauty.

It is this that will bring a life divine in the material world and the union of spirit and matter. Previous spiritual realizations didn't reach the level of supermind and didn't have the power to transform universal nature; but supermind is the ultimate creative force, and does have that power.

The Supramental Sense

Of course, as with any great world-changing movement, there are always early adopters; and Sri Aurobindo and the Mother were early adopters of the supermind. They developed an integral yoga by which human nature can be transformed into supramental nature. They also left many books, including 13 volumes of first-hand reports *(Mother's Agenda)* describing what it's like to perceive with the supramental sense and bring the supermind into the very cells of the body.

Weirdly enough, these reports sound sometimes like descriptions of quantum particles before the collapse of the wave function—particles that exist in all positions simultaneously and behave like waves till they're measured. The Mother says, for instance, that a supramentalized cell is no longer individual in the separate sense—it's as if it's omnipresent (Van Vrekhem, 2002, p. 180). Her body too feels no limits, as if it's spread out everywhere (Satprem, 1982, p. 36). She also speaks repeatedly of a material consciousness that feels like the movement of corporeal waves (Satprem, 1982, p. 22).

We recall now how Sri Aurobindo says that mind, i.e., the consciousness of division and separation, is the cause of atomic existence, and also how quantum physics seems to indicate that observation—by someone with mental consciousness, of course—collapses the wave function.

Perhaps supermind, which differentiates without dividing and expresses multiple points within a single oneness, perceives matter as wave-like; or perhaps supramentalized matter somehow behaves differently than mentalized matter. In fact, the Mother says that as matter is permeated by the supermind, it develops new qualities of subtleness, suppleness, penetrability, plasticity, fluidity, and much less rigidity of form (Mother, 1984, p. 58).

The Mother also talks about perceiving a kind of material mesh enveloping the earth that connects events, linking them and making them interdependent; she says that if one has power over a part of this mesh, one can change a whole range of circumstances that in appearance are unrelated (Satprem, 1982, p. 211). Einstein might have called this "spooky action at a distance," but it sounds like nonlocality and quantum entanglement to me.

Integrating Scientific and Yogic Knowledge

I'm making these connections between science and yoga because I think there are some interesting connections to make. The Mother once said that although the practice of science and yoga are different, what's discovered will be the same because there aren't two things to be found, but one—the Omnipresent Reality.

I also want to bring up again, here, Sri Aurobindo's conviction that the more knowledge we have of the physical world, the better is our foundation for the highest spiritual knowledge:

> Nothing can be more remarkable and suggestive than the extent to which modern Science confirms in the domain of Matter the conceptions and even the very formulae of language which were arrived at, by a very different method, in the Vedanta,—the original Vedanta, not of the schools of metaphysical philosophy, but of the Upanishads. And these, on the other hand, often reveal their full significance, their richer contents only when they are viewed in the new light shed by the discoveries of modern Science . . ." (Sri Aurobindo, 2005, p. 16)

In 1961 the Mother observed that as she pursued the minute work of supramentalizing her body, she knew nothing from a chemical, biological, medical, or therapeutic point of view (Satprem, 1982, p. 70). Perhaps now in the age of widespread instant access to information, and as more people take up this work, it will be possible to integrate scientific and yogic knowledge to a greater degree than ever before.

The Union of Spirit and Matter

Of course, it's long way from mind to supermind; there are many difficult passages, intervening states, and challenges to overcome. But it is a journey worth taking, for Sri Aurobindo says that the supermind will give to the body a fullness of capacity far beyond anything now possible (Sri Aurobindo, 1998, p. 25).

The Mother says that the physical realization of divinity will bring a tremendous concentration of energy, a power and reality that exists in none of the other states of consciousness; it will be something solid, unalterable, complete (Anonymous, n.d., p. 298), with a precision and exactness down to the atom (Satprem, 1982, p. 35).

In the supramental consciousness, Sri Aurobindo says, we will feel the divine light and power and bliss above us and descending into us, filling every strand of our nature, every cell and atom of our being, flooding our soul and mind and life and body, surrounding us like an illimitable sea and filling the world, suffusing all our feeling and sense and experience, making all our life truly and utterly divine (Sri Aurobindo, 1998, p. 563).

And the Mother says, "I saw that secret, I saw that it is in earthly matter, on earth, that the Supreme becomes perfect" (Satprem, 1982, p. 35). "Anything we can humanly feel or see is nothing compared to that," she adds. "I have never seen or felt anything so beautiful as that . . . I've had hours . . . the most wonderful hours ever possible on earth" (p. 161).

I believe that's what we can be looking forward to.

Editorial

We are happy to publish another "regular" issue of *Integral Review* amidst a shifting publication schedule over the last year. This time has been busy with a greater number of special issues than regular ones! Some of this current issue's contributors—and perhaps some of our readers—have been eager for quite a while to see publication of another of *IR's* diversity-rich regular issues. With this current issue we are now able to provide a number of articles that have been in process for a long time, and are excited to have them available for the public.

Special issues offer the service of deeper dives into cutting-edge arenas, and *IR* has made a commitment to providing this venue to help it fulfill its mission while it furthers others' missions and interest areas. One implication of publishing special issues is that shifts our former semi-annual publication of regular issues. Thus while we will continue to publish regular issues of *IR*, the schedule will vary according to evolving conditions.

Along those lines, in the early spring of 2012 we expect to publish a special issue, edited by Markus Molz and Mark Edwards, comprised of papers from last year's *Research Across Boundaries* symposium. That event produced some very good interchanges among scholars in multiple integral domains and we look forward to publishing the proceedings. *IR* will also publish another special issue edited by Bahman Shirazi from CIIS in the first half of 2012, following on the recent proceedings from CIIS's annual symposium. We are hearing ideas for proposals of additional special issues and invite more such proposals. *IR* is uniquely positioned for this role and happy to exploit it, given its mission to publish integral approaches to transdisciplinary thought, research, and praxis that are too-often rejected by discipline-based journals.

We are also aware of a number of new activities relevant to our community of readers. We look forward to highlighting some of these in upcoming issues of our periodic newsletter. In addition, we invite readers to submit items they feel would be of interest to our community. Of course we also always encourage authors to submit works to us that you feel would meet our criteria and be of interest to our readers.

This issue is comprised of 16 diverse contributions, yet even throughout such disparate works are woven several related themes we suggest are particularly meaningful in this second decade of the 21st Century. One prominent theme is the pressing demand for highly-developed performance capacities in individuals and collectives if today's social and political complexities are to be understood in complex-enough ways for us to deal with them. Another theme is a necessary, though not sufficient, subset of the first: the role of sufficiently-complex self-reflexive capacities—on individual and collective levels—that enable keen observations and analyses of self, others, and the world we all operate in. And interwoven with these is another theme: the roles of impact-aware activism and leadership. We are grateful to this issue's contributors for playing leadership roles, themselves, by offering the fruits of their labors for publication.

Jan Inglis launches all three themes by identifying an unrecognized challenge that, if it goes unmet, poses dire consequences. In *"Holistic Democracy" and Citizen Motivation to Use a More*

SOME RIGHTS RESERVED

Holistic Approach to Public Decision Making, Inglis goes beyond her report on a small research project to explicate the implications and possible resolutions of a catch-22, a trap that we might say has the world by its tail: "people cannot commit to using a new, more time-consuming method [for holistic public decision making about issues] without experiencing what it entails and they cannot experience what it entails without committing time to do so." Her article unpacks why abandoning our quick-fix and "leave it to others to solve" mindsets is more essential than we seem to realize, and names some requisite methods and capacities to do so.

In *Skillful Engagement with Wicked Issues: A Framework for Analysing the Meaning-Making Structures of Societal Change Agents*, Thomas Jordan offers a highly systematized approach to examining the strong to weak continuum of societal change agents' awareness of task complexity, context, stakeholders, self, and perspective, and the vital relationships of these dimensions for sufficiently comprehensive activism and change leadership. Why does this matter? In these times, we'd say it *does* matter that we possess tools to help us assess how change efforts are conceived, how they are organized, how they are implemented, and why they do or not achieve socially-necessary results. Our penchant for following or supporting charismatic change agents should be informed by analysis of efforts' comprehensiveness and probabilities for effectiveness. Jordan's framework is a tool in that analytical toolbox.

Tom Murray drills down into and explicates capacity issues, some of which were emphasized by Inglis and Jordan, in his article primarily addressed to the community of integral theory and practice but apropos to all efforts intended to foster transformative praxis. His *Toward Post-metaphysical Enactments: On Epistemic Drives, Negative Capability, and Indeterminacy Analysis* is an argument for epistemic wisdom and what it demands of us: "w*hether* we believe in a god, or in capitalism, or an evolutionary omega point, is less important than *how* we hold that belief, and *how* we hold it is a matter of skills." Such epistemic wisdom is the fruit of a number of skills Murray carefully delineates. Since skills are acquired through practice and supported by a community of practice, reading Murray alone will not foster the development of such wisdom. His article is a clarion call for individual and collective reflexion, reflection, inquiry, and new skills in action, for all to heed if "second tier" transformative impacts are truly goals.

The remaining works published in this issue afford concrete applications of these themes. Benedikter argues for epistemic wisdom in connection with assumptions about paradigm change and if and where it manifests. Relevant capacities of notable individuals are examined: luminary Dag Hammarskjöld, former UN Secretary-General (by Kristian Stålne) and 2011 Norwegian terrorist Anders Behring Breivik (by Pelle Billing and Kristian Stålne). Our collective relationship to global change and capacity to be effective in that relationship is examined by Stewart Brand (by Russ Volckmann), and the integral community's relationships to AQAL and a lesser-known indepth development and deployment of AQAL are reflected upon by two participant-contributors in the 2010 Integral Theory Conference (by Hugh and Kay Martin). These pieces invite new lenses on people, phenomena, and epistemic wisdom.

New lenses support insight, and aesthetic insights support transformative action in a world that so sorely needs it. *Wauld*, by *IR's* Arts & Creativity Editor Andrew Campbell, and *Into the Long* by Sara Wolcott, both invite multifaceted gazes: micro and macro, near-sighted and far-sighted, short term and long term. We hope zooming in and zooming out on both of these contributions fosters aesthetic intuitions and insights on themes not only in this issue but also in readers' lives.

Finally, this issue offers reviews of a handful of recent books, which, as it turns out, elaborate on themes in the rest of this issue: *Organizational Transformation for Sustainability: An Integral Metatheory* by Mark G. Edwards, *Hope for Humanity: How Understanding and Healing Trauma Could Solve the Planetary Crisis* by Malcolm Hollick and Christine Connelly, *Political and Civic Leadership: A Reference Handbook*, edited by Richard A. Couto, *La Voie: Pour l'avenir de l'humanité* by Edgar Morin, and finally *Transversity: Transdisciplinary Approaches in Higher Education* by Sue L. T. McGregor and Russ Volckmann.

We sincerely hope *IR's* readers will enjoy this issue as much as we have enjoyed preparing it!

"Holistic Democracy" and Citizen Motivation To Use a More Holistic Approach to Public Decision Making

Jan Inglis[1]

Abstract: The broad focus of this paper and the study about which it reports centre on the implications of applying holistic approaches to democracy, or more specifically to public decision making practices. This paper advocates that more complex and holistic methods be used to respond to the complexities of global issues. It describes how these processes take more time, commitment, and structure to use and it raises a question regarding citizen motivation to use such processes. It addresses this question in three ways: It presents a term 3D Democracy that highlights this complexity; it discusses why public processes need to address the task of decision making, and it reports on a small case study. Results of that study indicate that using critical reflection and deliberation on the adequacy of current methods of public involvement in decision making can stimulate citizens to be interested in and motivated to use such a holistic method. The paper ends with reflections and further questions.

Keywords: adult development, complexity, decision making, democracy, holistic, motivation, public deliberation.

Introduction

> If you ask any group of people anywhere in the world, "How many of you woke up this morning with the intention of destroying the world?" nobody would raise their hand. So if we're doing it without intention and yet we're doing it anyway, it means that it's imbedded in how we do things as opposed to being something that we want to do. And that tells me it can be reversed.
>
> Paul Hawken, author of *The Ecology of Commerce*[2]

General Overview

The broad focus of this article centers on the implications of applying holistic thinking to democracy or, more specifically, to public decision-making practices. This paper advocates that if we are to make the best use of public insight and innovation in resolving the complex local and global challenges of these times, we need processes of public engagement that meet at least the following criteria, where they:

- Adequately address the full complexity of the issues involved, while avoiding a propensity for simplistic formulations, either/or polarities, and band-aid solutions.
- Engage the general public including the various diverse stakeholders at a level of competence that supports their contributions and renders them to be of optimal value.
- Motivate and enable such participation to accurately analyze, name, frame, and deliberate in order to make decisions about actions that may resolve issues.
- Accomplish this within the time, talent, knowledge, budget, and other constraints of resources and power inherent in the public situation, in the participants, and in the conveners of such processes.

In addressing these criteria three empirical questions surface.

1. Can members of the general public, with adequate support, deliberate collaboratively and competently enough to tap the diversity of experience and wisdom as they collectively have to offer, and gain such commitment and support for change as the issues they are addressing may demand?
2. Can the complexity of these issues be framed and presented in such a way that this competence can be adequately engaged to create relevant, useful, and sustainable outcomes?
3. Can the process itself be presented in such a way that supports understanding and justification of its use?
4. Will members of the public be motivated to take the time and put forth the effort needed to make such contributions as often as may be needed if the daunting public challenges, both local and global, are to be met?

---

[2] As quoted by Montagne, C. (2010, n.p.).

The first portion of the paper offers an analysis of the theoretical perspectives that inform these criteria, and a brief survey of the relevant literature, It then offer three responses to the empirical questions: (a) the conceptualization of the term “3D Democracy” to support participants’ understanding of the need for a holistic multidimensional approach, (b) the distinction of processes deigned to support decision making, and (c) a report on the findings of a small scale public deliberation in which a facilitated method of critical reflection and deliberation based on holistic principles was used to test its impact on people’s motivation to subsequently consider using a more in-depth approach to public decision making.

To provide the context for this study, this next section will outline my own motivations and background and describe the challenges of current public decision making processes as well as the challenges of introducing a holistic method to the public.

Background and Motivations: Personal and Global

For many years, I have focused on trying to understand how we—humanity—could allow ourselves to destroy life through climate change and other related issues. Through my work as a psychotherapist for many years, I could see how some individuals could, with support, become aware of their personal issues and eventually change their patterns of perception and actions in a way that could alleviate many of those issues. But with growing awareness of social issues, it started to seem insufficient to continue working just on an individual level when total system change seemed to be necessary. However, transferring this awareness to a collective level, especially in the public sphere such as in our responses to climate change, seemed much more complex to undertake. Over the years I studied different theories of how social change occurs, sensing that our current ways of organizing ourselves, especially within the environmental or social justice movement, were obviously not adequate, as these situations were not changing for the better. How those in these movements viewed issues, set priorities, and made choices regarding actions did not seem to match the complexity of the challenges we faced as a culture. My experience in community development at a grassroots level revealed that people’s involvement often descended to the lowest common denominator of fighting to promote one’s own biased perspective, or blaming others for their perspectives. If solutions were presented, they often promoted simplified, short-term, band-aid actions.

Although I considered myself an activist and wanted to be part of positive responses to climate change or social justice issues, I found I could not keep attending those kinds of dysfunctional meetings. Even facilitated conversation café’s, where people at least were polite, left me feeling hopeless that we could ever develop the level of understanding and depth of decisions needed to create comprehensive change. Although I was trained in such techniques as consensus, mediation, and Bohmian dialogue, my own attempts at facilitating what I hoped would be more beneficial forms of engagement seemed to flounder. At that time I lacked the “container” I believed was needed to support the quality of talking, thinking, making meaning, deciding, and acting together. By “container,” I mean an intentionally planned discourse process designed to support interactions that resulted in more functional outcomes. Such a container or scaffolding is needed to generate effective approaches amidst the diversity of opinions and the complexity of issues.

This article is written in this context of complexity of social, economic and ecological issues, especially those under the banner of climate change, which are apparently increasing more rapidly than our collective capacity to effectively respond (Kegan, 2000; Rosenberg, 2002). This gap became overtly apparent to those who witnessed the proceedings of the UN conference on Climate Change at Copenhagen in 2009 (Randall, 2010) or in Cancun in 2010. Such systemic issues require systemic responses if we are to get beyond bandage interventions with their unintended and often disastrous results (Ross, 2006). Commonly-used civic engagement approaches such as voting, town hall meetings, or more recently popular, dialogue cafes, seem unable to support the level of issue analysis and decision making that systemic issues require. Although important civic events, they offer short term, fragmented glimpses of issues that need more from us. There are few, if any, participatory methods available through which we can collectively come to understand the complexities and implications associated with the whole issue before we are faced with making decisions about it (Inglis, 2007).

Awareness of this growing “gap” between the complexity of public issues and the simplicity of the processes available to address them (Inglis & Steele, 2005), plus my in-depth research and inquiry over several years, culminated in my studying a deliberative process for use in public decision making.. This process researched and developed by Sara Ross (2007) drew on research in complexity science, adult cognitive development and behavioural sciences as applied to analysis of complex public issues. More information regarding this process is provided in the literature review, below.

In the past six years, I have engaged with several pilot projects based on this method. In all cases, I observed that participants were motivated when initially engaged, but getting people to want to invest in a new and unknown process was a very difficult first step. Also sustaining their motivation throughout the lengthy and new process was often challenged by them losing the orientation regarding how what they were doing related to their initial motivation. A more comprehensive process such as this requires much more commitment to time, focus, and structure than typical public engagement methods (Inglis, 2008). Several progressive steps designed to assist people to see issues in a larger interconnected context are needed so participants can analyze causes, weigh out approaches to solutions, anticipate differences in viewpoints and consider trade-offs they are willing to live with. This larger context also includes recognizing that our personal attitudes, values, and actions as well as our institutionalized attitudes, values, and actions are part of how we create and maintain problems. Arriving at this level of systemic understanding and ownership is hard and often “messy” work that needs to be intentionally and effectively supported by the process design and facilitation (Ross, 2006).

The public challenges we currently face are immense, and decision making is hard work, and there seems to be no way around either of these facts. But bad news of immense challenges and committing to this kind of hard messy work are hardly attractive motivators to engage ordinary folk. Therefore the question of how to introduce a new, more complex process in a way that would make sense to citizens and motivate them to try it out has been a barrier I felt needed to be addressed. Below I present a term, 3D Democracy, define a hypothesis regarding citizen motivation, and present a small study used to test that hypothesis.

Throughout this article, I have turned to holistic science theory and action research by describing and reflecting on methods that are dynamic, relational, participatory, multidimensional, complex, emergent, developmental, and engage the whole by moving through the parts.

The Term 3D Democracy

To make the significance of a substantively different process for engagement more perceptible to the general public, I eventually developed the term *3D Democracy*. This term attempts to support citizen reflection by graphically highlighting why more dimensions for tackling their issues are needed than what the usual "flat" term of democracy offers: addressing the depth of interconnected root causes, the breadth of multiple perspectives and length (short or long term) of responses. This critical reflection on current often reductionist, two-dimensional processes (e.g., win/lose polarities and yes/no voting) may potentially seed the necessity for more holistic multi dimensional, multi perspective approaches to civic decision-making when dealing with complex issues. For those seeking the theoretical roots that underlies this work, the term *3D Democracy* also captures the need for three D's: it is the **d**evelopmentally **d**esigned and **d**eliberative nature that can adequately support citizens to walk together through the complex steps necessary to arrive at well- informed decisions and to take effective actions.

The term is also useful to raise awareness of what we may call a "third dimension," one that is beyond the two common dimensions of "public" and "private", namely the dimension of the "commons." Elinor Ostrom, Nobel Prize winner, explains this dimension in her seminal work, *Governing the Commons: The Evolution of Institutions for Collective Action. About the significance of public process in the protection of shared resources,* where she said "if the community doesn't have a good way of communicating with each other or the costs of self-organization are too high, then they won't organize, and there will be failures" (Korten, 2010. n.p).

Many public engagement processes wish to support comprehensive actions but skip the step of making collective decisions that could result in those collective actions (Inglis, 2007). Therefore, it is sensible to use the next section to highlight this distinguishing component and surface its logic in relation to the public engagement criteria presented previously.

Why the Focus on "Decisions"?

Oil spills, sprawl of cities over agricultural land, migration policies, and water use all represent situations in which decisions are made that impact the public and the environment. We often miss the significance of these watershed points. To see ourselves as actively impacting decisions, either through conscious participation or not, can move us from viewing ourselves as victims of outside forces to active participants in co-creating our life situations. This is especially important when considering the choices facing us in relationship to climate change.

However, people are seldom aware of how complex the process of decision making is personally, let alone collectively. If we are to respond adequately to the complexity of climate change issues or any complex issue, we must make *collective* decisions, some of which will be quite difficult, about priorities, policies, and actions. It therefore is important to amplify the significance of this often-overlooked process of making public decisions, the very essence of democracy, and offer ways to observe, understand, and thus support comprehensive decision making.

Considering the severity of many of our local and global issues, it is no wonder that people want to take immediate concrete action. There is often impatience with sitting in meetings and talking. If people do not comprehend the sequential steps needed to develop sound public solutions, there can often be a sense that simple solutions should just appear, as if dropped into the room. However, before taking action, there has to be decisions by several people (unless we are in a dictatorship) to take the action. Before these decisions can be made, there need to be relevant options available to decide upon. Before these options for solutions are identified or created, there needs to be shared understanding amongst those most involved regarding the diverse causes of the problem.

Problems are often labelled under big sweeping categories, so before these causes can be understood there needs to be agreements on which aspect of which "problem" we assume we are actually discussing. In addition, everyone understandably sees things through their own lens of experiences and values. Therefore all of these steps are influenced by diverse perspectives that need to be included. Taking actions will likely have implications that also need to be considered. If we attempt to shortcut any of these sequential steps, our actions may not get at the systemic roots of the issues and merely offer bandage treatments. To undertake these steps well requires patience, time, and structured processes to support our best selves coming forward. Decision making, if we want satisfactory results, will require more from us than many are used to giving and there seems to be no way to shortcut this investment if we do not want to incur unintended consequences or sabotage by those who feel their voices were left out. There is a tension between taking adequate time to deliberate on such issues, in our "business as usual lives," and the realization that we are running out of planetary time, especially when facing pressing, rapidly increasing and catastrophic issues.

The Hypothesis Regarding Citizen Motivation

The focus of the rest of this paper is the following hypothesis: (a) shared reflection by members of the public on the usual approaches to and past experiences with public participation, and (b) consideration of other approaches, systematically presented, may (c) lead to new interest and willingness to exert the effort required to participate in more demanding but more rewarding participatory methodologies. The aim of the action research reported here, carried out with a small group of community residents, was to test in a preliminary way, whether a facilitated structured deliberative process designed to elicit critical reflection on current public engagement and decision making processes would indeed arouse the interest and motivation to use a more adequate, if more demanding, holistic public process.

Next, I provide definitions of the key terms used throughout this writing. Then, the remainder of this article is organized in the following sections: a description of the theoretical context, a literature review of significant materials, an outline of the methodology used in the study, and an analysis of the findings. Copies of the materials used in the public process are supplied in appendices.

Definitions

As orientation, I have provided a list of definitions I am using in this paper.

Civic Engagement: interactions in the local, regional, national, and/or international communities to which citizens and their chosen representatives belong, designed to identify and address issues of public concern, as well as increase investment and ownership. Other terms commonly used are public involvement or participatory democracy.

Complex: made up of many interconnected or interwoven parts. In the realm of public issues, this would indicate the presence of many, often tangled elements that are usually not seen and, therefore, not addressed. A complex issue, due to these many aspects, is difficult to respond to by a yes or no vote, in response to a single simplified question, as are offered every few years through elections of referendums.

Deliberation*:* a method for deep consideration or weighing out of options and implications prior to arriving at a decision. Public deliberation is a specific form of civic engagement and can be referred to as *deliberative democracy*.

Emergence: coming into existence of a new property or properties due to the interaction of sub elements. The properties of the new phenomena cannot necessarily be predicted from the properties of the sub elements.

Holistic: philosophies and methodologies that support an integrated, systemic approach that includes context, complexity, emergence, and intrinsic qualities of relationships amongst the phenomena. These recognize that complex systems have “emergent properties” that describe their characteristics as wholes and that these properties are conditioned, but not determined, by the system’s constituent parts.

Perspectives: ways of perceiving or points of view influenced by life experiences and conditions. Different and valid perspectives both naturally arise from different life experiences and create different life experiences. These can be referred to as frames or approaches.

Systemic thinking: seeing interconnections of elements involved within a context. Systemic thinking includes awareness of cycles or networks, accepting counter intuitive effects and reducing unintended consequences by considering gaps and implications (Ison, 2008).

Literature Review

Included below is relevant material related to holistic science and democracy, deliberation and citizen motivation.

Holistic Science

As I have advocated the use of a holistic approach, I here include the relevant literature relating to the science underpinning that approach.

Holistic science is often defined by how it differs from reductionist science[3], but its particular definition differs according to the scholar. Henri Bortoft (1986), Rudolf Steiner (1998), David Seamon (2003), and Margaret Colquhoun (1996), for example, expand on the 18th century work of Wolfgang von Goethe, who emphasized a science of qualities, relationships of “intrinsic necessity” and the importance of coming to know the existence of the whole through the understanding of the parts. Goethe, in his exploration of colour understood that perceiving colour was really a perception of relationships, as no colour exists separately but always in a context, a contrast to Newton's sense of separate colours. In addition, he emphasized how the attention to distinguishing the detail of parts, such as leaves of a plant, served the understanding of how they functioned as an expression of the whole. To understand a plant both in its wholeness and its distinctions we can look for repetitive patterns that will help us answer the inquiry: "How do you grow?" Based on our detailed observation and inquiry we are able to move beyond a sense of fragmented bits of concrete stems and leaves to construct a meaning of the dynamic whole. I apply this as a useful metaphor later when describing the study group‘s process.

---

[3] See Schumacher College: What is Holistic Science http://www.schumachercollege.org.uk/courses/why-holistic-science

Holistic science has its basis in the natural sciences. However, holistic scientist Fritjof Capra indicates that systems thinking develops when we see patterns and connections in biology, a capacity which can be applied to social sciences. In exploring the implications to learning and communicating in both the biological science and social sciences, he builds on the work of biologist Humberto Maturana and social scientist Gregory Bateson. Both articulated a connection between perceiving difference and the development of cognition (Capra, 1996). Maturana felt it was the perturbations in relationship to the environment that triggered structural changes in an organism. Bateson indicated that the differences associated with these "perturbations" could be defined in terms of a hierarchy of logical types involving orders of abstraction in which higher levels are defined by the ability to organize lower levels and overcome the "contraries" or unresolved contradictions of the lower level. He expanded on these levels to create an organization of logical types as a way of noting how classification is used in all perceiving, thinking, learning, and communicating (Bateson, 1972). Bill Torbert (2004) built a bridge between types of logic commonly used, and ways we commonly structure talking. He proposed and researched the possibility that by reflecting on, and consciously structuring our ways of talking, we could transform personal actions, organizations, and politics.

Concepts from complexity science such as self-organization and emergence have created a vital connection between the natural sciences and social sciences (Francis, 2009). In relating complexity science to how people organize, Eoyang and Olsen (2001) suggest there are three interconnected conditions that influence a system to self-organize: (a) creating a container e.g., the intent and support for interactions and deliberation; (b) surfacing diversity and differences that stimulates creative response; and (c) increasing the frequency of transforming exchanges so feedback loops can reveal the consequences of our choices and also inform us as to who "we" are.

Although differing in some emphasis, all of these holistic scientists indicate that holistic science encompasses a non-linear approach that does not attempt to precisely predict, separate, or control information, knowledge, or outcomes. There is loose agreement that holistic science methodologies that support an integrated, systemic approach need to include understanding of context, complexity, emergence, and intrinsic relationships amongst the phenomena. There is recognition that complex systems have "emergent properties" that describe their characteristics as wholes and that these properties are conditioned, but not determined by, the system's constituent parts. It is understood that people's perceptions, especially those of scientists, impact what is being seen and interpreted and are, therefore, part of the whole. Therefore, the subjective realm of interior beliefs, values, and motivations are considered to be as necessary to include in scientific observations as more objective external data. Bateson promoted a subjective approach but also cautioned against the often sloppy definitions which can occur in behavioral science: "in scientific research you start from *two* beginnings, each of which has its *own* authority: the observations cannot be denied, and the fundamentals must be fitted .…[otherwise you] add to the existing jungle of half baked hypothesis" (Bateson 1972, p. xxi).

Democracy, Deliberation and Public Motivation

Central to the question under investigation here is the extent to which the public is, or can become, both willing and able to engage in public discourse at a level complex enough to make real contributions to the solution of public problems. Two organizations in particular have pulled together a substantial body of practice addressing public engagement processes: the National Coalition of Dialogue and Deliberation, and the Kettering Foundation. There are also several individual researchers and practitioners proficient in this field including Atlee (1999), Bohman (2000), Delli Carpini et al (2004), Fishkin (1991), Gastil (2008), Rosenberg (2002), Ross (2006), and Yankelovich (1991). They point out the difficulty of current public decision making whilst describing the need for, as well as challenges of, public discussion.

Tom Atlee refers to holistic politics (1999) or integral politics (2010) defining holism as the need for inclusivity and coherence of the parts and the wholes. He advocates that politics, where one part is fighting against another part, cannot achieve this holism. In response to a building disillusionment with democratic practices, Bohman (2000) argues that deliberation can support democracy by improving responses to the complexity, pluralism, and inequalities of society. He challenges assumptions that the public is "unreasonable," by saying that people are often not supported in discursive situations where they can use their reason, or, as Kant would say their "enlarged capacity for thought." Both Fishkin (1991) and Yankelovich (1991) have argued for and demonstrated the potential for the public to successfully deliberate issues before arriving at a decision. Yankelovich has shown that when people are presented with complex issues to consider, they can change their views over time, with the right forms of support for doing so. From his research he observed that people's views regarding an issue will, through focused engagement on an issue, progress through predictable steps from spontaneous, re-active individual opinions to more considered deeper public judgments.

Developmental psychologist Shawn Rosenberg (2002, 2007) has applied an adult developmental lens to public decision making and especially deliberation. He argues that the reason we have challenges in public engagement is that the requirements of participatory democracy are beyond the developmental capacities of many citizens. The ability to collectively analyze a complex public issue, reflect on and communicate one's ideas, understand and be concerned about the perspective of others, are all necessary skills in order for people to engage effectively with each other around complex public issues. He suggests that these requirements are simply beyond the developmental capacities of many individuals and social groups. At the same time he also holds out the hope that well facilitated public deliberations can potentially support the development and engagement of these capacities and thus offer citizens a better chance at responding to the complexities facing them in the 21st century. Although Rosenberg's (2002, 2007) theories address an area close to that of my inquiry, they do not however appear to have yet been translated into descriptions of, or research regarding, applied methods for how that facilitation would be implemented or how citizens might be motivated to use such methods (Rosenberg, 2009).

The key to effective engagement of diverse participants then is good design and facilitation. Deliberative processes can shake people out of the cognitive shortcuts typically used to frame day-to-day problems. As a result of moving out of this comfortable pattern, anxiety and frustration can be provoked, especially if the process that participants are using does not seem to be providing any new short cuts and simple solutions (Ryfe, 2005). To be willing to engage with this kind of frustration people would need to be highly motivated. At the same time, frustration itself, when tied to high stakes and handled properly, can increase motivation. Thus, Stephen Tyler, when discussing multi stakeholder deliberations has pointed out

> Cognitive and cultural theory suggests that when the decisions are important and the participants have a meaningful stake in the outcome (that is, stakes are high and the stakeholders are at the table), they are likely to be more motivated. In addition, motivation is enhanced by accountability to others, by a sense of threatened interests and by engagement with others who have different perspectives. All these factors are socially and culturally constructed, therefore the nature of deliberative processes must match its social and cultural context. (Tyler, 2009, p. 5).

A case study was done regarding the progressive effect of deliberation on the public's views of priorities in health care (Dolan et al, 1998). The researchers concluded that “The public's views about setting priorities in health care are systematically different when they have been given an opportunity to discuss the issues. If the considered opinions of the general public are required, surveys that do not allow respondents time or opportunity for reflection may be of doubtful value” (Dolan et al, 1998, p. 916). Due to the discussion, participants saw the complexity of the issue that then caused them to change their original sense of priorities. However, participants did not go the next step and resolve their differences regarding these priorities. The methodology was not a holistic one by my definition, nor did the facilitators offer the group any structure to guide their deliberation or to arrive at decisions that could potentially transform the old perceptions and actions.

The research of Sara Ross was closest to my own focus. In her doctoral dissertation, Ross (Ross, 2007) addresses citizen hope and motivation to work on specific problematic issues as a result of going through several steps of issue analysis and deliberation. Whereas my question was more related to how citizens might come to understand the need for engaging in such a time consuming and comprehensive process to public decision making

Ross (2006) offers a methodology for public deliberation that specifically takes on the need for complex thinking when responding to complex public issues, and the realities of the developmental differences that such deliberations must support if a wide enough diversity of publics are to be engaged. Her method addresses both the need for progressive steps as well as the need for structure and facilitation that supports motivation. Based on the work of Commons et al (1998), she defined the precise progression of steps involved in supporting citizen deliberation. The progressive steps are drawn from research in adult development, behavioral sciences, and complexity theory. Her preliminary research, summarizing and integrating these sources, suggest that there is a recurring pattern in the steps people go through in confronting complex issues, one that is fractal in nature and occurs across different scales of decision making from personal to organization to cultural (Ross, 2008, 2009).

To illustrate these steps, here is a simple example, regarding buying a car. A would-be purchaser moves from *thesis* (e.g. "I will buy a car"), *antithesis* ("I can't afford a car") to *oscillating* ("I have to choose between being carless or being poor"), to a *chaotic* or "smash" state (Commons & Richards, 2002) where new options are tested and adjusted to see if they can possibly fit to satisfy the initial need (buy a used car, high maintenance fees, borrow friends car, feel beholden). When carried out fully, such a sequential process can lead eventually to a more coherent state of synthesis expressed by an often unexpected solution that satisfies all of the presenting conditions (joining a car co-op - ta da!). This solution was not even among the options initially considered available, but emerges due to the focused consideration of the parts.

Such a process may repeat cyclically and with more complexity. With each repetition, as new information is encountered, the synthesis becomes the new thesis and the cycle repeats, but now at a higher level of complexity. This progressive repetitive pattern of decision making operates over various scales, topics and situations. Ross argues strongly for the benefits and challenges of these decision steps, and their essential role in well-designed public discourse. As she has shown in her own empirical work, such a design provides the structure that can hold the tensions that arise between competing views, and support the process to move through a complete cycle, towards resolution or synthesis. Synthesis is possible only when the new option or approach successfully addresses the inadequacies of the other options. This theoretical model presents a detailed and developmental understanding of what occurs in the phenomenon of emergence resulting in new solutions to old issues. Ross' (2006) preliminary research on this process that she calls The Integral Process for Working on Complex Issues (TIP) would meet several of the criteria I defined as a holistic approach.

In contrast to this holistic approach, pioneer in decision analysis, Howard Raiffa went as far as saying "The spirit of decision analysis is divide and conquer: Decompose a complex problem into simpler problems, get one's thinking straight in these problems, paste these analyses together with a logical glue, and come out with a program for action for the complex problem" (Raiffa, 1968. p. 271). Later, in a post-retirement article, he said he had been so enamored with the certainty he felt was offered through his earlier mathematical approach, that he had completely missed the boat regarding the many other aspects which underpin making complex decisions (Raiffa, 2002).

However, I find that the simplicity and reductionism of this divide and conquer mentality still pervades many of the conventional approaches to public decision making. The foregoing has provoked me to research the motivation for people to consider using a more holistic approach discussed below that can include and synthesize, not divide and conquer.

In summary, although there are rich fields of theory and research regarding (a) how individuals make decisions, (b) how these decision are impacted by reflection, (c) how public deliberation that includes reflection can support public decision making, and (d) how challenges occur in democracy, there is little about the public themselves reflecting on their current forms of involvement in decision making to see how that might impact their motivation to use a holistic process. My study was intended to fill that gap by showing how a holistically designed process for public reflection on decision making prior to participants involving the public in decisions, might motivate them to use a holistic approach.

Study Methodology

A community group from a coastal city in England faced with the challenges of engaging their community around contentious public issues participated in the study. Using materials I designed for the study, I engaged this group in an intensive four-hour deliberation regarding common but different perspectives regarding how to engage a community.

Research Methods

I used a holistic method, including critical reflection and deliberation, to conduct a small, non-experimental preliminary test of my hypothesis that these experiences would increase interest and motivation to use a holistic approach to public decision making. The process I used was holistic in that it was designed to maximize interactions, support a comprehensive and integrated consideration of the diverse perspectives, contexts and layers of complexity of an issue, engage both subjective views and objective detail, stimulate shared inquiry and systemic thinking, and promote a new synthesis or whole to emerge through the detailed consideration of the parts. I hope that describing the step by step progression involved in this methodology will be helpful to other practitioners in the field of community engagement and social change.

I used a two-phase process of applied social research: a four-hour participant group session and follow-up interviews with individuals. As my research was based on non- numerical data, I used a qualitative analysis of qualitative data using empirical observation, and semi structured interview techniques (Bernard, 1999). My research findings should be viewed as preliminary due to the small convenience sample and the fact that I did not use a control group. All observations are my own, based on information I collected and analyzed, and reflections I made.

Group Selection

When considering my research project I was hoping to find an existing community group of about 9-12 members who were currently facing some community issues. I wished it to be an ongoing group versus an ad hoc group for two reasons. One was that an ongoing group would more likely be dealing with a real issue, common to all participants, instead of a more “armchair” conceptual issue created just for the research process. Also for integrity reasons, I wanted the process to be useful to the participants and did not want to raise issues where there was no ongoing process by which these could be addressed. In addition, a group with a defined boundary and identity would have more contained and continuous interactions. The group was composed of city and district councilors and community group representatives. They had been meeting for several months and had co-developed two documents regarding strategies and action plans. Their focus was to find ways to engage the whole community when facing community issues as there had been a history of fragmentation, competition, and bad feelings that was making coordinated planning very difficult. This group and their concerns perfectly matched the focus of my research.

Although it fell on the first warm Saturday of the spring, nine members were committed to attending including the mayor, three councilors, and five community representatives. The town clerk indicated support by arranging for a room to be booked and snack food to be available.

Development of Materials

Prior to the session, I talked with six participants by phone to make sure I understood the nature and context of their specific concerns. I wanted to hear the potential differences in how those concerns might be framed amongst the group participants and to hear how they felt involvement in community decisions could occur.

Based on this information, as well as on previous background research into this issue, I created an “issue booklet” to guide their deliberation. An issue booklet provides a thorough and neutral way by which participants can consider the whole issue through looking at the multiple layers and perspectives associated with the issue. Since deliberation supports the deep consideration of an issue, it is helpful to have common, legitimate perspectives of what might be solutions to the issue in question clearly articulated for this consideration. The question that I used to focus the deliberation was ‘*How should citizens be involved when important public decision need to be made?*” I used the template format for creating an issue booklet for deliberation created by Sara Ross (Ross, 2006) whose theoretical model and research I described in the literature review. It sketched out four common but very different (and potentially contentious) perspectives that could motivate people’s approaches to community involvement in decision-making. These perspectives are developmentally sequenced in the issue book.[4] The main headings are as follows (See Appendix 1 for complete issue booklet):

- Approach 1: We advocate for the rights of our group when our needs are threatened
- Approach 2: We do our civic duty, vote for leaders, and assume they are accountable for making fair decisions
- Approach 3: We can make decision by being strategic and efficient in order to maximize opportunities
- Approach 4: We reach out and include as many people as possible to work together as a whole community

These differences, gathered from their concerns, illuminated the tensions that I assumed lay unresolved within the group, possibly blocking them from moving forward in their discussions on community involvement. Like the Goethian method of understanding the details of a leaf in order to understand how a plant grew, I was offering them a way to see the specific details of their communities’ viewpoints so they might have a more comprehensive understanding of how their issue grew. Each approach offered the underlying logic that motivated the differing actions people might choose to take in relationship to community decision making. The usual underlying logic, or orienting idea, becomes more explicit. This provides more information as to why people might think and act differently and therefore the differences make more sense. This method offers a way for participants to consider differences in a focused, less fragmented manner without the threat or defensiveness that often arise from fearing differences. More energy can then be focused on inquiry and reflections regarding the impacts that different choices may incur. The group's consideration was supported or "scaffolded" through the presentation of very detailed observation of the "parts," or different natural perspectives, with the hypothesis that the sorting, critiquing, and comparing of these would help them consider their adequacy and co-construct their own synthesis or "whole," and more adequate approach.

---

[4] For more information regarding the developmental sequencing see Inglis (2009).

Session Process

The issue booklet as well as an agenda (see Appendix 1) was sent to the group several days before the groups met. When we met, I clarified my role as facilitator: I would guide them through a structured process but I would not influence the substance of their discussion as that lay within their expertise. I also clarified the limitations of the process and the implication of the brevity of this session, emphasizing that the intent was not to magically "fix" the issues that day but to support their discussions. Based on a prior agreement the session was audio taped. We did an opening round in order to hear people's motivations regarding focusing on the question of public involvement in decision making and what they hoped to get out of the day. People were very eager to talk and it was difficult to stick to the "taking turns" format of a round or to staying on topic. Next, I gave an overview of what deliberation was, comparing their experiences in personal deliberation to public deliberation. To increase sensitivity to diverse viewpoints, I led participants through an experiential warm up exercise of assuming different perspectives. I presented a set of general group process guidelines regarding qualities of talking, listening, and taking turns and asked if they were in agreement to respect these, and this was affirmed.

Then we proceeded step by step through the issue booklet. Like a jury, giving each approach its just opportunity to be presented, fairly heard, and considered, they spent time focusing on each approach separately. At the beginning of each new approach, a different volunteer read out the descriptive information for that approach. Then they all took a few minutes of silence to allow for reflection on the implications of taking this approach before voicing their responses. This allowed for more considered responses and the breaking of a habitual behavior of immediately reacting in an opinionated way that can often happen in community groups. Then they each spoke saying what they felt about the benefits, concerns, and trade offs that might arise with each approach. I captured their thoughts under each of those headings by writing notes on a flip chart for all to see. This allowed them to see how they were building their own understanding of the parts. It allowed their thinking to be transparent to each other as it evolved, and documented a record of their progress. I later typed and emailed them these responses. I have included the table of their transcribed responses for each approach in the results section further below. It reflects their thoroughness and deep consideration, as well as indicates that none of these approaches appeared to be considered as being satisfactory on its own. This is important to note since, without this kind of reflection, people often take absolutist stances that indicate their own point of view *is* satisfactory and needs no further consideration.

After considering each approach, and facing their own reality that all of the options had benefits but also had some negative consequences, the group was asked to create some statements of what conclusions they had reached. These comments were also written on the flip chart. The summary of these comments are described in the results section with details in Appendix 2. In general, without any prompting from me, the participants arrived at statements that described a comprehensive "whole" approach to how they wished involve the community in decision making. It was whole in that it included the implications of the other approaches.

People were very engaged, and it was difficult sticking within the time frame. The last portion of the deliberation of all of the approaches was pressed for adequate time and the next steps of planning how these conclusions would be carried forth into their next meetings and implemented unfortunately did not happen. We did an abbreviated closing round to capture reflections on the day. Participants, as well as I as facilitator, worked hard and ended the day being both tired and appreciative.

Follow Up Interviews

Between four to five weeks later I emailed the same six participants I had spoken to prior to the meeting and sent them an outline of interview questions (see Appendix 3). I was able to reach only five participants. I set up dates for the interview and recorded their input. The purpose of my interview was to gather their perceptions regarding the process to ascertain if they perceived it as having value, and, if so, in what way. I specifically wanted to see if, based on their experience, they would express motivation to reuse such a process.

After the session, I compiled data using interpretations of qualitative analysis based on several aspects: my observations of individual participation and group relations during the session, content of material developed in the session, and interviews with individuals before and after the session.

Limitations of this Study

My case study findings were limited by the small group size. The length of the session and participant fatigue, which I discuss in more depth later, may have limited the quality of participant engagement and integration of their experiences. Time, location, and finances also limited my ability to extend the study to include control groups across several diverse communities. It also limited ongoing sessions with the study group in order to observe if or how the awareness and motivation present after the study session, continued to develop and inform their ongoing interactions.

Study Results

This section reports on the impacts that participants' critical reflection and deliberation had on their interest and motivation for using holistic methods for public decision making. I will particularly highlight changes in their interactions, their consideration of the diverse perspectives, contexts, and interconnected layers of complexity regarding their issue, and the emergence of a new synthesis or holistic approach. As the process is developmental in nature, meaning that the nature of participation changes through the stages of the session, I report on it sequentially. I begin with the various aspects of the group session and then the post session interviews.

Group Session

Why does this Matter?

The question in the opening round "why does considering this question today matter to you?" provides a baseline for the motivation to proceed into the session. It allows people to say why this topic matters and to hear why it might matter to others. It allows the inquiry to move from the topic as an abstraction to one that embodies their experiences. In response to the question, I observed that participants were very eager to talk about the frustration of civic life and the hopes for how a group such as theirs might make a difference. Some spoke of competing needs between the desire to gather community input, which was at times uninformed or wishful thinking, and the demands of getting on with making pragmatic "realistic" decisions. Some talked about times in which community consultation had been done but was not inclusive of everyone, or the results were not listened to by council. These frustrations with community decision making are common to civic life and can often block citizen's motivation to continue to engage. Several participants found it easier to focus on what wasn't working in their community than what was or might work.

Although I had clearly indicated and repeated that the purpose of the rounds was to do a short two to three minute statements of interest in the topic just to get us started, several people had difficulties keeping their remarks within that time frame or on that topic. Some also had difficulties taking turns and listening to others without breaking in and making side remarks, or even personal affronts. I observed that many comments were absolute statements about people or situations "out there" advocating generalizations of what should or shouldn't have happened, with fewer offering more contextual and personal reflections. I could tell that these kinds of more open participatory process skills were a challenge for this group and the facial expression and body language indicated frustrations were being triggered. There also was laughter and positive energy. These types of interactions are also common to public meetings and impact citizens' motivation and ability to inquire, reflect, and see the interconnecting patterns of their issues effectively. I felt I needed to be very active and firm as a facilitator to keep to the time, structure, and purpose of the session with the assumption that this would support their interactions while not stifling their very significant expression and input.

Perspective Taking

With some coaching and modeling, I observed that people were able to participate in the perspective taking exercise, telling personal stories of times when they had experienced a particular perspective that arose due to certain life conditions at that time. This exercise was intended to invite people to progress from single solution advocacy regarding external events, to being able to consider several approaches, a skill needed for the next stage. It can seed self-reflection as well as the possibility of realizing that ones internal perspective, as well as other peoples' perspectives, can differ due to different circumstances. This realization potentially transfers to an openness if not awareness that there will naturally be different perspectives in the community as well regarding public issues such as the one being deliberated that day: i.e. different approaches to community involvement in decision-making.

Critical Reflection and Deliberation of Different Approaches

The results of this section were derived from two aspects: the information created by the participants in response to their deliberation and my observations regarding their interactions and responses to the perturbations of being presented with distinctly different perspectives to the same issue.

Once we moved into the next steps, participants were focused on the joint task of analyzing the different approaches to the question of community engagement outlined in the issue booklet. I observed that their interactions indicated a sense of shared conversation and listening with interest to what others were saying. As by design there was no "right" answer expected, or no winners or losers anticipated, the tendency towards competition and defensiveness, apparent in the opening round, relaxed. As the different views were already voiced equally in the issue booklet, I interpreted their relaxation as meaning that individuals in the room did not feel they had to spend time defending certain views. People were given equal opportunity to talk and this seemed to build trust to engage more fully.

Figure 1 displays transcriptions of their deliberations of the four approaches, provided at this juncture because these provide context for further reporting on results.[5]

How should citizens be involved when important public decisions need to be made?

Approach 1: We advocate for the rights of our group when our needs are threatened

Benefits	**Concerns**
– This approach builds solidarity which feels good when you belong – It focuses peoples energy and thinking, provides safety for some – We find our voice, increase articulation – Learn how to make issue popular, provides skills in marketing, communication and engagement increases	– The issue gets lost in the group dynamics – Increases emotional tension, attacks get personal – We can create long terms negative effects: creates outsiders, alienation, exclusion – There can be a mob energy, fear of hostility, suppresses many voices – People hijack process, circumventing decisions becomes habitual – People react before seeing the whole picture

Trade-offs we would need to consider if this was our only approach:

- We may increase our sense of belongingness but at a price of producing deep distrust and chronic negativity.
- The more we use this approach the more repetitive it can become…we get in a reactive pattern.
- We need to find our voice but after listening not before

Circumstances

We might consider doing this if we could ensure conditions that could be positive, constructive, realistic and produce quality

---

[5] See the full issue booklet in Appendix for the full context of the transcriptions. This context is not necessarily self-evident from Figure 1's headings.

<table>
<tr><th colspan="2">Approach 2: We do our civic duty, vote for leaders and assume they are accountable for making fair decisions</th></tr>
<tr><th>Benefits</th><th>Concerns</th></tr>
<tr><td>– Ordered, prevents chaos, I know what is expected of me.
– Tried and trusted over a 100 years history of using this in which it has more or less worked
– There is a clear manifesto. It does provide a system and gets something done.
– We know that every 4 years there is a debate and a vote
– It is a platform for us to have good leaders
– We know who is accountable.
– We know who we can blame</td><td>– We don’t get as much responsiveness or innovation, as quickly as we may need
– Lack of motivation, flexibility
– We do not include all voices, not include diversity
– Subtle differences and culture nuances not reflected in a vote
– Vote only 4 years, gives us no input into implementation of what we voted on, no way to make sure of follow through.
– Focus is too much on one person, one leader
– We do not chose who the civil servants are but they have influence
– Only a few people vote so who really is represented (can fall into approach one)
– Boundaries impact representation and so impact the issues</td></tr>
<tr><td colspan="2">Trade-offs we would need to consider if this was our only approach
– If we have “good” leadership this approach works well but if we do not then there is little we can do. (and there would be different views as to what ‘good” leadership was)
– We get a majority vote but what happens to the minority (which could be 49%) Please some of the people some of the time, but not all of the people all of the time.</td></tr>
<tr><th colspan="2">Approach 3: We can make decisions by being strategic and efficient in order to maximize opportunities</th></tr>
<tr><th>Benefits</th><th>Concerns</th></tr>
<tr><td>– We could have the best information, best experts and the best decisions
– Strategic approaches help us form outcomes
– When people are involved it increases
– ‘our”‘ expertise first then agreement and comfort
– We get more “buy in”
– There are people who are specialists or experts who can help us, bring in another view
– Decisions which are evidenced based provides us with proof
– Consultations can provide quality thoroughness and objectivity
– We do need a decision making body that is strategic and efficient</td><td>– For approach 3 to work well we would need to have a good approach 2 in place
– Marketing can be used to promote a bias
– Some “scientific information is supposed to be sound” but holds a bias
– Consultations take a long time and meanwhile peoples views may change making the consultation less useful
– There is no guarantee that the experts cannot be bought or biased by those who fund them, done behind closed doors
– There may be opportunities that we lose by taking this time
– The consultant may not ask the right questions or deep enough questions in their surveys…we may miss saying what we need to</td></tr>
<tr><td colspan="2">Trade-offs we would need to consider if this was our only approach:
– We may intend to do a lot of good consultation but the distrust or “ …..<i>city</i>…. disease” may still prevent us from working together
– We want the support of the expertise and evidence, but do not necessarily trust experts or evidence quality or objectivity.
– Consultation can increase engagement but what happens if it does not get to the depth of our community issues that underlie our divisions or distrust.
– We like the efficiency and possibilities but not to the point of cutting funds that support important public services
– We may increase the community buy in but how do we know it has integrity and not been bought with a</td></tr>
</table>

<table>
<tr><td colspan="2">bias
Circumstances
“Realpolitik”…. Keep the focus on the practical relevant issues and less on morals or ideologies</td></tr>
<tr><th colspan="2">Approach 4: We reach out and include as many people as possible to work together as a whole community</th></tr>
<tr><th>Benefits</th><th>Concerns</th></tr>
<tr><td>– This approach could address so many of the concerns of the first three. It connects representative democracy with participative democracy. Without this approach, we can beat each other up all the time.
– We get to hear more people, and get a broader concept of what is wanted other than just one source
– This is fundamental to representative democracy
– We will hear each others fears, and possibly decrease the fear of the unknown
– If done well (would need to define what that means) we could heal the “…city… disease”
– When we know our opinion is valued we are more willing to participate, then community has a sense of being valued</td><td>– Would depend on an effective Approach 2 (a representative government), and effective Approach 3 (getting people informed)
– In an individualistic society we are not as concerned about how we all work together
– We may be too busy to engage like this, and learn about the issue. And if we don’t engage and learn we may sabotage other decisions
– We would need to really see the broad picture and the complexities to participate well. People differ in their ability to do this.
– Lots of us take a stand on issues so would manipulate these participatory processes leading to more distrust
– We may not see, or want to accept the realities of the options before us and the limitations that come with all options. Want a simple wish list and not want to deal with priorities, consequences, tradeoffs etc.
– Do decisions actually get made in those processes? or do we just sit around and chat and get too self absorbed to deal with the issue?
– Our city has to grow up, engage in consultation and be willing to live with the decisions that were made and not sabotage (or revert to Approach 1)</td></tr>
<tr><td colspan="2">Tradeoffs we would need to consider if this was the only approach:
– Potentially more people can be involved but it works only if we are informed
– Potentially more people can impact decisions but it works only if people know what they really want and can reach agreements
– We can do a lot to attempt inclusion but it will not be perfect (and we have to live with that frustration)
– We can include many people but cannot provide people with everything
– We want more involvement but do we actually trust the vast majority of people to make good decisions? or trust our own engagement processes.
– If we want a trustable process we would have to define and agree on principles and a design of what we think would make a process trustable.
– Processes have to be done so that people can see the possible consequences of choices.

Circumstances
– The size and importance of the decision and how if it concerns the whole community needs to be considered to see if this approach is necessary
– How processes are designed makes a difference</td></tr>
</table>

Figure 1. Transcription of Group Deliberation of Four Approaches

Deliberation of the first approach: *“We advocate for the rights of our group when our needs are threatened”* was given a great deal of attention. Approach 1 captures the “us versus them” nature that characterizes and stalls many civic interactions. I observed that participants recognized the sentiments, benefits, and challenges of this approach, but in their spirited discussion actually were falling unconsciously into demonstrating it. At times, the discussion looked like it could slide into taking sides and needing to air resentments about old issues. I could have stopped the discussion right then, focused on this element, and used it as a real time reflection point, regarding how their own interactions might mirror the difficulty with community interactions. However, I did not feel that I had established adequate trust with this group and nor had created adequate structure to support that discussion, so in the moment I did a quick internal deliberation, weighing out the options I could take as facilitator. I chose to go on with the agenda hoping that from the experience of reflecting on several more approaches they might recognize that their concern was in fact included fairly in the issue booklet. I also hoped that the structured shared reflection might be of benefit. I attempted to be transparent on how I arrived at the choice I was taking, stating that their frustrations and history were obviously important and needed to be addressed, but in order to do so satisfactorily we would need the support of a different meeting, designed for this purpose. This seemed to make sense to the group and we proceeded. There seemed to be motivation, interest, and energy to move onto deliberating the next approaches.

Relevance is connected to motivation and based on their discussion it seemed that participants saw the material in the issue booklet as relevant to their concerns: they recognized the values and actions of each approach and found validity in naming and discussing the benefits and challenges and trade offs of each. In addition, they related the approaches to specific examples that happened in their community. The time restraint of the four-hour session meant that the discussion regarding each approach had to be curtailed in order to move on. However, it did appear that they were using critical reflection regarding the context, interconnected layers and complexity that came with each approach and the adequacy of different approaches to meet their needs for community decision making.

In general, people appeared to like Approach 4: *"We reach out and include as many people as possible to work together as a whole community"* as it seemed to address the concerns they raised about the previous three approaches. They also saw the difficulties inherent in using it, which would need to be resolved for this approach to be satisfactory for them (taking too long, never making decisions, potential of manipulation, etc.). By the time we reached Approach 4, the quality of discussion had changed amongst most participants. There were voluntary silences in which people seemed quite pensive. This was a very different quality than the more assertive and reactive statements being made without deeper considerations noted at the beginning. People in general were building more on each others' points or looking to fill in gaps they noticed amongst their exchanges, than looking to declare and defend their own statements. Overall, they appeared to be more in relation with the issue and with each other. However, it also was getting late, and the analysis had taken a lot of focus. Some people may have been getting fatigued and potentially "losing the plot" or overview of what we were attempting to do as they at times reverted to trying to focus on the details of their concrete "what's," i.e., recounting stories of distrust regarding old contentious issues, instead of looking at some of the process "how's" i.e., ways this present session could be used to co-develop approaches so those issues could be better addressed.

This attitude seemed to reflect a deeply entrenched assumption that some things could not be trusted, and that one had to always maintain a vigilant stance. It created frustration in the group. This dynamic can commonly develop in public life when people do not feel themselves a part of public agreements to take actions. I realized that this stance introduced another sub issue for the group that also might need to be addressed. I will report the implications of this on the study results in the section on post interview questions.

An Emerging Synthesis

As we had adequately deliberated four approaches, we moved on to the task of seeing what, if any, conclusions they had reached to address the question *How should citizens be involved when important public decisions need to be made?* The focus of my observations was on whether this consideration of the benefits but incompleteness of these different "parts" or approaches would stimulate them to design something that would feel more complete. This step ascertains whether they can move beyond "smash" or the messiness of considering these several different, legitimate, but often competing approaches. Several summary statements were made that indicated a need to include the legitimacy of the previous approaches but also transcend the limitations that they had discussed. Examples include:

> *"We need to find a way that there is a two way street between an active engaged community and responsive elected officials. There needs to be mutual responsibility for this relationship otherwise issues and perspectives cannot be understood, our decisions cannot work or be trusted. We next need to find ways to put this principle into action."*
>
> *"We need to consider what combination of process will be good enough that all (community organizations, representatives, elected officials and the community) will engage with it."*
>
> *"If we did a good job of combining the best of 2, 3 and 4 we could reduce the need for, and problems which arise from # 1."*

It is unfortunate that time and energy limitations prevented further work together. With more time, participants might have fleshed out the details regarding actions that would operationalize these statements and developed specific agreements on what they wished to do next. However, the concluding statements they created indicated that a new *whole* had emerged from their consideration of the parts. It seems important to underline the fact that the points quoted above were not present at all in their pre-session interviews or in the deliberation of the separate approaches. The statements made hold the complex layers of their deliberation and arose from the interaction. This stage demonstrated their ability to create a synthesis, a new, more coherent, holistic option that they felt would more adequately meet their needs for pubic decision making.

Post Session Interviews

Although I emailed the questions ahead of time and used them as a guideline in my phone interview, the actual conversation was less linear or on topic. Of the five participants I interviewed, all were generally positive about their experience of having participated in the session, feeling it had been useful. They all indicated it was an energizing experience that held their attention. One person stated, "I left refreshed, feeling we had accomplished something." All of them affirmed that it was a benefit to hear diverse views, saying it allowed them to know each other better and know where they were coming from. Most felt this process would be beneficial for other community members and for other issues, stating that a broad group of the community would need to be involved to be representative of the community's voices. Two indicated it was a "high level discussion." Some said, although their group was motivated, they were concerned as to whether the community at large would be motivated or be able to talk at that level. Some recognized that this way of discussing was very different from how communities usually interact in public discussion. One person said: "People don't usually look at issues, discuss, or analyze. It just does not happen that way. People tend to make statements, they may seem like they are asking questions or want to discuss, but they are just statements. They are entrenched [in their views]." This could infer that being entrenched in one perspective impeded a more satisfactory holistic approach being created.

One participant said that most community meetings have an agenda and a chair who asks people to vote and there is no discussion or hearing of different viewpoints. In comparison this process "allowed people to be thoughtful of things they had not thought of before …and it took us to a new place." One person said that "we could see after going through the different approaches that it was complex, no one approach is going to give us what we want…and we have to knit [them] into a coherent whole, we can't just mix and match."

Some remarks, gathered anecdotally from a participant, were made by two city officials who had wanted to attend the session but were unable. Based on what they read in the summary notes, what they heard from some participants, and what they experienced in the subsequent meeting, they were quoted as saying "they had missed something highly valuable." This same participant said that the process was too brief and needed two more sessions. She felt that right after the session there was motivation to commit to more sessions. However, in checking back with the group two months later, I understand that without facilitation, they have not been able to sustain their momentum or continue developing ways of implementing the holistic approach they had co-created during the session.

The stance of distrust taken by some participants during the session was mentioned in most of the interviews, seeming to divert them from being able to focus on what else was experienced in the session. Although these challenges were distracting and uncomfortable, one person said "I actually felt relief that the session showed the negativity: it was obvious." This seemed to infer that there had been an unnamed elephant in the room that, once surfaced, might now be dealt with more directly than was possible before. When further questioned, there did not seem to be a sense yet as to how this "negativity" came about (other than two participants attributing it to those individuals' personal failings) or how it would be worked with. Focusing on the challenge of how to respond to this distrust might have taken precedence for the group and put the outcomes of this sessions' work on the back burner.

In summary, the results indicated that based on their critical reflection and deliberation about current public decision making processes, participants were interested in and motivated to use a more holistic approach both for their group and for the community. They did see that both the conclusions they reached, and the process we used, were different from, and, for some, significantly better than, usual public interactions. However, the motivation did not translate into the group independently taking the next steps of further developing and applying this approach.

From these research results, it is inferred that further facilitated sessions may have been needed to incorporate this motivation and institutionalize a new praxis for their involvement in public decision making. In addition, another designed deliberative session, structured similarly to the one we used but using different content, might have been needed to assist them to create an approach for responding to the question "how to more effectively work together."

Conclusions

This small research project used a holistic method of facilitated structured deliberation that supported critical reflection on current public engagement and decision making processes. The results indicate that the process did support the emergence of a more holistic approach and did positively influence the interest and motivation of participants to use a more holistic process again. This section provides a discussion of the key results offering reflections, interpretations, and implications.

Support for Reflection, and Transformational Learning

As suggested both by my literature review and by my observations, reflection is a capacity that cannot be taken for granted. However, it is a necessary capacity if more systemic holistic approaches to complex public issues are to be developed. The initial, more loosely-structured opening round of my research group showed that even basic capacities for interaction, let alone reflection, became strained in that unstructured context. Nevertheless, with structures such as the issue booklet and a trained facilitator supporting their reflection, they were able to interact in ways that allowed them to consider different perspectives and co-generate new ideas. Through the back and forth dance as Mezirow (1991) described, participants were able to reach coherence, between parts and wholes, current events, and habitual perspectives. Their resulting increased capacities to listen to each other and consider multiple perspectives appeared to be a primary motivator for them to have interest in using holistic process for future decision making. Based on observations, information from interviews, and anecdotal evidence, I believe that if I had been available to continue to facilitate this group, their motivation and interest would have been adequate to support their participation in the next steps.

This conclusion resolves a question about a "Catch 22" dilemma I have faced and described in part in the introduction: people cannot commit to using a new, more time-consuming method without experiencing what it entails and they cannot experience what it entails without committing time to do so. My study suggests that arranging a single session to work with a core community group that has influence in the community, and giving them a chance to experience the process through focusing on a motivating question, is a useful method to introduce a new process for public decision making. Once introduced to the process, people had the basis needed for committing to further steps. By deliberating multiple perspectives and trade offs for developing methods of public involvement in decision making *prior to* actually involving the public in a contentious decision, one may anticipate that unforeseen consequences could be decreased and involvement improved. Further research would be needed to indicate if reinforcing feedback loops would occur and more learning and motivation could result. The research results might support Habermas'(1991) advocacy that increased ability for communicative action can provide the basis for a theory of social evolution and Ross' (2006, 2007) research that political development is fostered through developmentally structured analyses that culminate with designed public deliberation for systemic action. The results touch on further implications beyond the scope of this paper regarding social construction, namely that the developmental capacity to reach higher levels of thinking rests as much in the group as it does in the individuals that have participated in the group. (Vygotsky, 1978). The research results are consistent with Friere’s (1993) emphasis on the significance of experiential learning. Holistic processes are not ones that can be taught or talked about just conceptually. They need to be experienced as they involve embodied internal transformations that cannot be attained when only described through abstract language (Reason, 2005). Telling most people that “by using deliberation based on an issue booklet of multiple approaches to decision-making they might see the complexity of their issues and arrive at more satisfactory methods for the group to move forward” has no context for most to understand. This has to be experienced. Shifting one’s perspectives based on deeply considering the validity of another person’s or group’s perspectives, especially regarding a contentious public issue which holds many complex layers of values and habitual ways of behaving requires an embodied, internal transformation.

The Importance of Distinction and Articulation

When talking with participants I did not use the terms “holistic approaches” or “facilitated structured deliberation.” I intentionally did not reduce the description of the process we used to an abstract label under which to pigeonhole the experience. However, from my observations I realized that participants had no quick way to describe their experience other than “what we did on Saturday morning” or “the group we did with Jan.” Since the process entailed many aspects that were experienced differently by different members, I avoided describing it as one “thing.” A trade off is that by not having a quick way to name and classify something, the experience may not be able to be retained, or promoted. There was no easy “branding.” Possibly the use of the term 3D Democracy would have been helpful.

I saw that there are both benefits and concerns in reducing phenomena to abstract labels. As Bortoft (1996) said, categorization required for labeling something makes us focus too much on *what* we see, not the *act* of seeing itself. And it especially, I would add, makes us miss the co-action of seeing with others. If participants focused only on the written materials we created on that day, but not on what was involved *in the act* of creating them, then the process might not have been as useful and potentially replicable for them. This points to the need for reflective rounds at the end of such processes in order for participants to articulate this co-action of working together and co-developing a new way of seeing. Although I did have a closing round, it was very rushed and was a new experience for several participants. As Bortoft indicated, something significant happens when an experience is described or distinguished: “the act of distinction ‘there’s it’. We come to see what we previously could not” (Bortoft, 2009, n.p.).

Integrating the Rational and Experiential Gap

Theory in holistic science is often attempting to respond to the perceived divergence between the rational world of objective detail and the subjective world of experience and intuitions. This relates to a question that was posed in the process of my writing about this study: “Can citizens make informed decisions before they have integrated, detailed scientific (rational) and experiential (intuitive) knowledge?" (Harding, 2010). Based on my literature review and study, my conclusion is that they can reach informed decisions not before or after but *through the process* of integrating these two aspects *if supported* through a holistically designed process that enables that integration. Support was provided through articulating this gap between the details of the known, and the experience that the known was not working, and through identifying and facilitating the participants' real motivation to resolve this gap. Support was also provided through voicing, in the issue booklet, the "contraries" or discomforts that arise when experiencing this gap. Thus the distinct details that constituted the discomfort could be seen, deliberated, and potentially resolved at a higher more holistic level as Bateson (1972) predicted. If we assume that citizens will need to gain this necessary integration *before* they can even take on the task of making crucial decisions, especially those involving climate change, it may take too long as this ability to integrate is an advanced capacity.

> Goethe said of this stage of knowledge, which is beyond dualism, that the enhancement of our mental powers which it requires 'belongs to a highly evolved age'. In other words, we have to develop the capacity for this to take place…..
>
> The development of participative consciousness takes us beyond the metaphysical attitude, i.e., one-sided Platonism, and allows us to see that this is simply a consequence of the onlooker mode of consciousness. (Bortoft, 1996, p. 275)

This "participative consciousness," if it relates to the capacity for placing oneself in the system one is observing, is described by theorists and researchers in adult learning and development as being one which is reached over many years, and by only a small percentage of the population based largely on their life conditions (Commons et al, 1998; Torbert & Associates, 2004).

Meanwhile, considering the dire circumstances on the planet, vital decisions need to be made now, and by diverse populations with different values and capacities, analogous to those encountered in my research group. However, if the process is holistically designed, as my research indicated, this diversity can be used as a tool for integration, not an obstacle: it can potentially reduce the gap between the onlooker mode of consciousness (rational) and participative consciousness (experiential). As Bortoft said: "The intuitive mind is moving right into the concrete parts in order to encounter the whole. This encounter leads to perceiving the dynamic and living multiplicity of the whole" (Bortoft, 1999, n.p.).

Elephants on the Path

Another reflection I have is regarding surfacing the "elephants" or unspoken tensions in the room. This raises another Catch 22 dilemma. Many social change organizations want to make a difference out in the world but have their own internal dynamics that prohibit them from making decisions and taking action as effectively as possible. Instead of using collaborative inquiry to explore how they may have co-created and maintained dysfunctional patterns, they may develop patterns of blaming and sub grouping that eventually overtake their otherwise well intended purposes. They are not likely to respond to the elephant until they have consciously experienced it and safely articulated its presence. As my research indicated, facilitation may often focus initially on some issue "out there" only to discover that there are issues "in here." Once surfaced, these might then be addressed if there is adequate shared reflection, acknowledgement, and motivation to work on the internal dynamics. This may be a risky thing to do and requires a structured holistic approach to move though the possible transitions of action, reaction, smash in order to synthesize into a new form of dynamics. Ross (2006) indicates that before a group can effectively respond to complex relationships that make up their community *politics*, which are defined as culturally common ways of relating, they may benefit from using a designed deliberative process to consider their tone and intentions in their own politics or ways of relating to each other.

Fatigue Factor

At the end of the session, there was a sense of both highly motivated energy as well as a sense of fatigue from working intensely for four hours. Considering details pertaining to decisions with enough thoroughness to thoroughly understand the potential benefits, consequences, and trade-offs cannot be done sloppily; it takes concentration. Being open to different views than the ones we are used to hearing inside our own heads can also take a lot of emotional energy. Moving through the “smash” stage of transition before synthesis can be difficult (Ross, 2008). As Ryfe (2005) indicated, facing into the reality that there are no quick fixes, and that issues as well as our interactions are complex, can be frustrating and anxiety producing. Even with all of this, based on my research in using a holistically designed process, the group did indicate a motivation to use a more complex process for making decisions.

Fatigue can also occur when effort is not valued either financially or socially. It suggests another potential research question to consider: how can this kind of work, often done by community volunteers for the good of the commons, be compensated and sustained? It would point to a need for creating a new form of calculating value, including knowledge and capacity building as resources that add to the common pool of resources and require compensation from that common pool (Ostrom, 2000; Quilligan, 2009).

How Much is Too Much Investment?

An underlying and unanswered question arises in terms of how much time and commitment would it actually take for a holistic process such as this to really affect the specific issues this group was trying to address, as well as the culture of public involvement in the community as a whole. Is it too fatiguing and daunting to consider? This could be the focus for a subsequent research project. Just for the sake of presenting a potential hypothesis to test, I will do a quick projected calculation of how much time this might take. What if the research group met two to three more times to turn their holistic concepts for public involvement in decision making into specific agreements regarding strategies for action? And before that, what if it took another two to three sessions to deal with how members wished to deal with their internal dynamics? Then, if they had another community issue to work with, such as rezoning, affordable housing, food security, energy efficiency, etc., then they would again need five to seven sessions to clarify the question, anticipate and deliberate the various approaches the community might have to it, and engage more of the community in a process to publicly deliberate the options and reach conclusions they could support. By now, there might be some understanding of *what* was being done as well as the understanding of the *act of the doing*. Motivated by this understanding they might then wish to transfer this process to yet another new issue in the community, which would also need another five to seven sessions. By this time, the capacity to use this process more regularly and independently might have been integrated. Altogether, this might have taken sixteen to eighteen sessions. Is that too much? Would there be motivations in carrying through with this larger investment? When people do not understand the nature of making a holistic decision and are still hoping for a quick fix based on just looking at a part of an issue, and not understanding how the whole issue grew, then it might be too daunting. However, when compared to other ways the public has available for responding to controversial issues it might actually be shorter and result in more effective responses. For example, how many hours went into planning and executing the Copenhagen conference on Climate Change and what did it yield?

The Role of the "Champion" and the Role of the Facilitator

Outside of the holistic process itself that was researched, there are at least two other contributing factors that deserve mentioning and potentially researching: the role of champion and the role of facilitator.

By champion, I mean the person or persons who serve as a supportive bridge to a new group. In the case of this research project, there was someone who understood the need for a more holistic process in their community even though they may not have understood the details of the process itself. When introducing something new into a community, this role of innovation diffusion is vital for communication and basic legitimacy, and does not easily happen through impersonal written articles or cold calls. Therefore, another question that could be researched is: how does one find champions, and what capacities for holistic thinking regarding complex public issues would a champion require?

Another question that could be researched is the role of the facilitator: what degree of integration of holistic thinking, as well as training in this specific process, would be required for the research results to be duplicated by another facilitator? This question is raised based on a hypothesis that holistic practices are not just "tools" to be taken off the shelf and plugged into any situation out of context but rather involve facilitation based on prior experience in reflection, analyzing the context and complex layers of personal and public issues, and supporting emergence of new understanding through the messy sorting of multiple perspectives (Inglis & Steele, 2005).

Implications for Democracy

Recognizing that reflection and integration do not come easily and that fatigue can be a factor, has implications for a more participatory multidimensional democracy, especially considering the gravity of the issues we face globally. We are facing what seem to be obvious signs of disastrous climate change with extreme heat and fires in Russia and Texas, floods in Pakistan Australia and China, and oceans becoming dead zones—and yet *still* we are caught in a gridlock between unresponsive government and economic structures not built to take effective action to such global issues. A regime change, or whole new set of principles, norms, rules, and decision making, is needed to create agreements on procedures for governance of the global commons (Vogler, 2000). To create these new relationships amongst ourselves and our planetary systems will require that "commoners," those most connected to the issue areas at risk, need to be much more engaged instead of passively hoping others will come up with solutions.

In April 2010, a conference on *Mobilising Democracy to Tackle Climate Change* was hosted in London by The Salzburg Global Seminar and Schumacher College. Afterward, one participant was advocating that based on (a) the necessity to make decisions rapidly in the world to avoid catastrophe, and (b) the incapacity for citizens to make decisions collectively, it would be better to use the efficiency of a Chinese style top down governance or a benign dictatorship. This implication, that people cannot be trusted as they are "unreasonable," as previously challenged by Bohman (2000) has also been disproved by results of my small study. This above advocacy apparently does not see the situation holistically, missing the context and complex layers that would be triggered by using this top down option especially amongst people who are used to "democracy" however flawed. It is wishful thinking to believe that some leaders will magically decide the right things for us all to do. How would we, as diverse citizens with different life experience and perspectives, all agree which government or dictator had our best interests in mind? If we did not agree, are we saying we would be willing to have military force put the rest of us in line?

It is regrettable a conference such as this, or those connected with UN agreements, did not instead frame the various different views and approaches to democracy that could be taken in light of climate change pressures. If participants were immersed in deliberation of the consequences and trade-offs that they, as concerned citizens, were really facing, this might have resulted in the emergence of a new understanding of ways to proceed with a different definition of democracy that included depth of root causes, breadth of perspectives, and length (time scales and scopes). However, if this conference operated like most conferences, the topic was likely considered abstractly, at professional arm's length. If so, then participants missed the chance of an embodied transformative experience that could arise from the "contraires" of their real, in-the-room different views being stirred up and needing to be resolved. A more holistically designed process, integrating objective detail and experience regarding their assumptions of democracy might have held this tension and resulted in participants getting really involved, and ultimately evolved.

Summary

We have a narrow window of time, in which many communities and nations still have the stability required to support more reflective holistic thinking about the issues we face in order to enable more comprehensive decisions and actions to emerge. Holistic thinking and methods do not arise on their own. As Goethe indicated, they reflect a more high level form of response. This framing of higher level approaches to effectively match complex tasks, echoed in research on adult development (Commons et a, 1998), is a key to unlocking the potential of public contributions for the resolution of complex problems. However, to reach this high level requires holistically designed structures to scaffold their rise to more systemic responses. Without such methods, and the commitment to use them to guide our collective evolvement, we face another darker possibility: that of devolving into, or continuing to rely only upon, individualistic, simplistic, divide and conquer techniques. The concepts and findings presented in this paper support a more comprehensive model of how democracy and citizen engagement can be presented, achieved and valued with the hopes that it can provide a more sustainable and life enhancing outcome.

> In this century, for better or worse, the long process of social evolution has reached the Planetary Phase, with the shape of the future subject to the ways we respond culturally and politically to the challenge of transition. Prospects for a passage to a decent world rest with the capacity for human consciousness and action to rise to this existential challenge of our moment. There is still time, but the hour grows late. (Raskin, 2010, n.p.)

[6] Developed by Jan Inglis

How should citizens be involved when important public decisions need to be made?

Approach 1: We advocate for the rights of our group when our needs are threatened

People may favour this approach if they assume that:

- *You can lose your rights if you cannot strongly advocate for them.*
- *Numbers and volume are powerful tools to use when advocating your concern*
- *Others can be corrupt and we have to defend against them taking over.*

People who favour this approach believe it is best because:

It is important to rally together and create solidarity when you need to advocate for a cause you feel is going unheeded. Examples of such issues might be if a building with historic or nostalgic value is proposed to be torn down, or a natural area is at risk, or if a new building is proposed that changes the landscape. Groups need to develop a strong powerful voice to be convincing and attract others of like mind or you will lose out. The bigger your voice and the clearer your message the more likely you are to win. It can feel good to work together like this. Governments may not notice our concern or may want to cover over controversy so you need to be vigilante. Government needs to be quickly responsive in an open non-judgmental way when public concern is raised. This public involvement process is useful as it is immediate, inexpensive, and a very clear method of getting action when decisions need to be made.

Sample Actions that make sense based on these assumptions:

- *Citizens organize a phone tree/email tree to get people to come out to public meetings*
- *Individuals start a letter-writing campaign*
- *Governments provide a clear process for requesting referendums*
- *Newspapers provide space for articles to present views on an issue*
- *Concerned citizens organize a door-to-door petition to force a referendum being taken*
- *Individuals tell others what they are going to lose to motivate them to respond*
- *Groups plan ahead to "stack" the mikes at public meetings or increase signatures on petitions*

Possible reactions we need to anticipate

- *"Having to keep rallying our group to take a stand takes too long and is too much work"*
- *" But anyone can lobby who has an emotional axe to grind, with no investment in the outcome or accountability to the impacts"*
- *"Militant lobby groups may scare off business investment in our community"*
- *" this is a band-aid approach and we need longer term total system planning"*
- *"This could polarize us into "good guys" and "bad guys" camps if we fall into being hard on people instead of issues"*
- *" I don't have a job and need to feed my kids, I don't have time to go to rallies and sign petitions"*
- *"Referendums are too costly and no one understand the issue or the question"*

A range of trade-offs that would need to be considered if this was the only approach we used:

- *We might win our cause but at what cost to ongoing relationships amongst our separate groups and community as a whole*
- *Information gets out but it is only from one viewpoint*
- *We gain some inclusion for our cause but may lead to some exclusion*
- *Increases involvement but sensationalizes the topic, adds a bias and could lead to polarizing community*
- *Increases involvement but maybe making opposition stronger (the backlash that comes from the ‘stronger you are, the stronger the resistance will be’)*
- *Forces an’ either you are on the bus or off the bus’ requirement for sense of belonging in community*

How should citizens be involved when important public decisions need to be made?

Approach 2: We do our civic duty, vote for leaders and assume they are accountable for making fair decisions

People may favour this approach if they assume that:

- *Voting is the legal and traditional way of indicating what citizens want.*
- *The "right" answer is simple and should be obvious to everyone*
- *Voting, rules and regulations will ensure accountability*

People who favour this approach believe it is best because:

Leaders who have received the majority vote, whether within organizations or government, have the responsibility to follow through on what we voted for. Our responsibility as citizens is to make informed choices when we vote and ensure we have leaders who are capable of making wise and just decisions for the common good. Public meetings need to be well publicized and we need to learn how to organize them so that the objectives are met and decisions are made in an orderly fashion. Our civic leaders have a lot of information to deal with to make decisions. Most information can be made available to the public. Citizens groups can offer input to the city and expect the council will act on their advice. Busy citizens do not need to be involved in every decision if they are not impacted by them or if they are too mundane. That is why we have elected officials and staff. If you don't show up and vote when you have the chance then you have to assume others will make decisions for you. Those who have lived in the community the longest may know it the best. Existing laws already dictate public involvement processes, and we need to follow these to avoid mayhem. Relying on known laws and the officials responsible for public affairs is a predictable way to manage change to ensure a stable future.

Sample Actions that make sense based on this belief:

- *Councils adopt definite policies to make information accessible to citizens*
- *City Council establishes a community advisory group made up of different community organizations with clear terms of reference and responsibilities.*
- *Council present clear procedures for how referendums can be requested.*
- *City task force ensures that members of the public know where and when the minutes of public meetings (council, school boards, regional district) are available*
- *Individuals take responsibility to seek out information on legislation, policies etc.*
- *Community groups can write letters to editor to defend elected people or processes in order to educate people about how politics and economics needs to work.*
- *Individuals can disempower the voice of rabble rousers by showing how they want to oppose the rules, or are just 'special interest' groups*

Possible reactions we need to anticipate:

- *"I don't trust government. The whole lot of them is just paying lip service to meeting our needs".*
- *"volunteering on the community advisory group is exhausting"*

- *“What about the poor, the youth, or busy young families? They are not able to be involved in politics and don’t get represented.*
- *“Depending on voting once every few years means we don’t talk together about the many deeper issues”*
- *“Rules gets in the way. I should be able to do what I want when I want”*
- *“Dependency on governments for change is too slow and stifles innovation and creative solutions”*

A range of trade-offs that would need to be considered if this was the only approach we used:

- *If we work together well as an advisory group we may be criticized for compromising and not still representing our individual groups’ interests.*
- *Does it help if more people vote if they are not well informed about the issue.*
- *Elected officials may try to represent the interests of their ward but what happens if people in their ward have opposing opinions.*
- *If we have strong government doing everything we may have passive citizens*
- *The yes/ no vote is simple and clear but most decision are more complex than that.*

How should citizens be involved when important public decisions need to be made?

Approach 3: We can make decisions by being strategic and efficient in order to maximize opportunities

People may favour this approach if they assume that:

- *People are motivated to get involved when they see the benefits*
- *There is an efficient cost effective way to get things done*
- *We don't want to get bogged down in unnecessary rules and process*

People who favour this approach believe it is best because:

People need to take individual responsibility to know how the political and economic system works. They need to get to know those who are influential and have expertise when they want to impact how a decision gets made. Citizens and elected leaders need to keep abreast of new ideas in order to make the best decision and not miss opportunities. The community needs to be responsive to the economic climate in a global community and be up to speed by making decisions that are innovative and adaptive. We need to make proposals that attract partnerships, and motivate the public to get on board so that we can move ahead on good ideas. If there is disagreement we can negotiate. Good public decisions need to be like good business decisions. Creating atmospheres for friendly competition and incentives generates multiple options for citizens and leaders to choose from.

Sample Actions that make sense based on this belief:

- *City includes contract experts to develop multi media presentations to inform and engage citizens on upcoming issues*
- *People running for office need to get known by advertising in the paper and on posters*
- *School system partners with city to support political debates for youth*
- *Stakeholders set up meeting with those most invested in having a decision made on an issue*
- *Create incentives for people to attend public meetings and community events (prizes, food, transportation, child care)*
- *Organize a conference with expert speakers to provide education about how government and civic budgets work*

Possible reactions it would be good to anticipate:

- *"Only the charismatic individuals or those with lots of money will be given attention"*
- *"I do not hang out in powerful circles so won't be able to influence the people who make decisions"*
- *"I don't want high paid outside experts influencing decisions in "our" community"*
- *"Having small groups influencing side deals makes government a sham".*
- *"Not all public decisions are business decisions; taking a business approach could result in decisions being made based on economic considerations but not in best interest of the public"*

- *"Youth just do not have enough grounded experience to be consulting on important public issues"*

A range of trade-offs that would need to be considered if this was the only approach we used:

- *We may educate the public more but risk becoming seen as spin doctors*
- *We gain input from outside experts but could be misled if they don't know our community*
- *If we spend money on hiring the expertise of consultants we will not have it to spend on other important programs*
- *We might gain from new opportunities but could lose the existing character of our community*
- *We gain from quickly seizing an opportunity but could lose well thought out implementation plans*
- *We may gain more participation at popularized events but people may only come for the free cake*

How should citizens be involved when important public decisions need to be made?

Approach 4: We reach out and include as many people as possible to work together as a whole community

People may favour this approach if they assume that:

- *By getting everyone together we can develop a common voice, a common future*
- *People know what they want, we just need to ask them*
- *Working together well takes time*

People who favour this approach believe it is best because:

Ensuring the inclusion of everyone in decision making, especially the minorities, is a responsibility we all need to learn to take. We need to create situations in which we learn to listen to all perspectives and decrease our tendency to argue and compete. Through citizen initiated gatherings we can share our wisdom and concerns with elected leaders to support wise decisions. We all need to come to the table as equals and develop consensus. If people feel left out of decisions they may become apathetic or even sabotage the decisions. Working together to find diverse solutions requires learning, commitment and planning. We should not expect it to happen right away. We need to find methods to weigh out the pros and cons of important decisions and not jump to quick fix solutions or expect our leaders to do so either. To make good decisions we need to see the big picture.

Sample Actions that would make sense based on this belief:

- *Councilors are trained to facilitate forums, discussion groups etc. to ensure diverse perspectives are heard*
- *Community advisory groups and city councilors develop work groups to take agreements from community forums and turn them into policy*
- *Council adopts a publicly supported policy for a community engagement and communication process for the annual budget*
- *City hosts one facilitated public forum each year to update the community vision for the future*
- *Non profit organizations adopt policies to model collaborative approaches within and across organizations*
- *A community advocacy group requests the media to inform but not inflame*
- *Community groups organize informal, small kitchen parties to share information and collect wisdom*

Possible reactions which should be anticipated:

- *'Community visioning just creates countless wish lists that we do not have the budget or ability to fulfill"*
- *"Most people have no clue of how a complex city operates so we cannot turn decisions over to them".*

- *“The autonomy of my non-profit society might be threatened if I collaborate because we have to compete for dwindling funds”*
- *“It’s idealistic to think that everyone has the ability or interest to participate in a community process”*
- *“Engaging everyone is too expensive, time consuming and get’s us now where.”*
- *“Community meetings are only for retired people who have time to burn”*
- *“I hate sitting in those boring wishy washy talking circles. I want action”.*

A range of trade-offs that would need to be considered if this is the only approach we used:

- *We might end up with much more active citizens, concerned about the community but are we really willing to take the time and money to do this well?*
- *Open participation and communication is good but may get manipulated by special interest groups or angry individuals*
- *We may want to be inclusive but risk excluding people who don’t like vague group process*
- *More information gets out but who ensures everyone gets it equally and in an unbiased way?*
- *We cannot ask for public input and then not be able to follow through on all the things they want*
- *We might get quantity of participation but cannot guarantee we get a consistent quality of informed participation*

Appendix 2: Session Notes

Conclusions

Questions posed:
"After our consideration of these different approaches where have we arrived at regarding our question: *How should citizens be involved when important public decisions need to be made?* What sense do we now have about how to move forward with an action plan? "

(*The following are points that were made but not sufficient time was taken to agree on wording. Also lacking are specific actions added that would implement them):*

- If we did a good job of combining the best of #2, 3, and 4 we could reduce the need for, and problems which arise from #1

- Recognize that issues are complex, if we do consultation, it needs to be deep enough to get at the underlying issues, that get at "why" options are being suggested, or "why" people have questions, so that minorities are not making decisions for majorities

- We need to find a way that there is a two way street between an active engaged community and responsive elected officials. There needs to be mutual responsibility for this relationship otherwise issues and perspectives cannot be understood, our decisions cannot work or be trusted. We next need to find ways to put this principle into action.

- We need to flesh out the approach we want and publicize it in the media so people know why we think this way.

- We need to understand more about the kinds of processes that we might use.

- We need to consider what combination of process will be good enough that all (community organizations, representatives, elected officials and the community) will engage with it.

One proposed draft of a summary statement was submitted:

We do our civic duty, vote for leaders, assume they wish to be and are accountable for making fair and well-judged decisions and that they have a process to secure this. The process should include full, thorough and open consultation with the community in order to maximise opportunities for the community in a strategic and efficient way to realise them. Confidence is a key word: our confidence as community associations that we are seeing the whole picture and responding to ideas thoughtfully and flexibly, together with confidence in the way our proposals are considered by leaders (political and professional) in the Town Council, District Council and County Council.

Appendix 3: Post-session Interview Questions

Post-session questions for participants

During the session with ___members on April 10th we addressed the question: *How should citizens be involved when important public decisions need to be made?* To remind you of what we covered in our session I have attached the summary notes in the email I sent.

The session was almost four hours long and we used a process called deliberation, focusing our attention on the issue book of four diverse approaches, looking at the benefits and challenges of each approach and the cost and consequences that would need to be considered if this was the only approach used. Then we summarized an overview of where we had arrived at after all of those considerations.

- Would you say this deliberative process is different from how community groups usually meet and talk together when facing a challenging issue? If so, in what way is it different?

- Do you feel this kind of process was useful? If so, why? If not, what changes would you suggest to make it more useful.

- I provided you with 4 different approaches or common perspectives for looking at an issue of decision making. Was that helpful. In what way? By the end of that session do you feel that the exercise of looking at different perspectives affect the way you considered community decision making? -*Read out final statements*; is this different than where you were at the beginning….in what way

- Did you feel motivated during the session to put in the time and focus the process required?

- Do you feel you would be motivated to use this deliberative process again when decisions need to be made about challenging issues which might arise in the community? If so how do you think it could be initiated so that others would be involved?

- If this process was used often, what if anything might be different regarding the outcome of public involvement in decisions? Could it be done regularly? What would that require?

- What if anything changed as a result of doing the session? For you ? For the community?

- If change did occur, why do you feel that change occurred?

- What if anything might still change?

Skillful Engagement with Wicked Issues
A Framework for Analysing the Meaning-making Structures of Societal Change Agents

Thomas Jordan[1]

Abstract: The argument underlying this article is that innovative and skillful change strategies are needed in order to handle a range of complex and difficult societal issues. For many of these so-called wicked issues, conventional institutions and policies have performed rather poorly. It can be reasonably argued that societal change agents play a crucial role in catalysing developmental processes regarding our societies' problem-solving strategies and organizational forms. The purpose of this article is to contribute to a deeper understanding of the different ways societal change agents engage wicked issues by developing a conceptual framework for analysing the meaning-making patterns of change agents. The framework integrates relevant concepts and models from the field of adult development with a specific focus on the role of awareness in five domains: task complexity, context, stakeholders, self, and perspectives. The framework is expected to be useful in analysing and explaining the variability in how societal change agents construct visions, goals, strategies, and courses of action, as well as in analysing patterns of effectiveness and success in initiatives that engage complex societal issues. Knowledge gained from such studies can (presumably) be used for designing more effective forms of scaffolding individual competence development as well as collective problem-solving and strategy development processes.

Keywords: Context awareness, perspective awareness, scaffolding, self-awareness, societal change agents, societal entrepreneurship, stakeholder awareness, task complexity awareness, wicked issues.

PART I: PRELIMINARIES

Introduction

How can we, the community of human beings, become more skillful in engaging complex societal issues? Many of the tasks a society needs to manage can, with reasonable success, be dealt with in the conventional way: delegating them to an organization with appropriate instructions, resources, competences, and structures. However, some issues are complex in ways that make such a strategy ineffectual, yet they are critically important in terms of the wellbeing and suffering of people and of the biosphere in general. The American planning researchers Rittel

and Webber (1973) called such issues "wicked problems" and made a preliminary analysis of why they have proved so resistant to resolution. Examples of wicked issues abound: long-term unemployment, marginalization of disadvantaged groups, climate change, crime, drug abuse, lifestyle-generated health issues, terrorism, armed conflicts, etc. Drawing on their conceptualization and those of others (see e.g., Chapman, Edwards, & Hampson, 2009), typical properties of "wicked issues" can be described in the following points:

- **Complex causality**. Social, economic, technical, environmental, psychological, cultural, legal, etc. factors are involved. Conditions interact in complex ways.
- **Many stakeholders**. The issues cannot be delegated to one actor. Cooperation among numerous different stakeholders is necessary for achieving significant results.
- **Deep-rooted disagreements** on (a) how to describe the issue and (b) what ought to be done.
- **Chronic**: The issues cannot be solved once and for all, they will continue to exist to some extent whatever we do. Therefore there are difficulties in agreeing on standards for successful outcomes.
- **Require systemic adaptation**: Because societal structures and processes are contributing to the emergence of the issues, isolated measures and quick fixes are ineffectual. Changes in how the societal systems operate are needed.

This brief summary shows reasons why these issues are truly complex. In order to handle such issues in constructive ways, we need capacities for perceiving, understanding, and managing complexity (Chapman et al., 2009; Inglis & Steele, 2005; Ross, 2006a). Capacities to manage complex societal issues do not necessarily reside in individuals. Skillfully designed methods and organizations and/or networks of people working together in constructive ways may allow us to create capacities that reside in collectives rather than in individuals with exceptional talents. However, in order to design methods, facilitate problem-solving processes, build organizations, and create and sustain networks that have these capacities, we need individuals who have considerable "awareness resources" at their disposal.

This article aims at contributing to a keener understanding of the role different aspects of *awareness* has for the effectiveness of people who want to make a significant positive change regarding wicked issues.[2] I will call such people *societal change agents.* The treatment of the topic here is adapted to the study of individuals, but many of the aspects covered will be relevant to groups and organizations as well.

Societal change agents are people who through their own initiative (rather than being told what to do by an employer) engage complex societal issues with an aspiration to contribute to systemic change on some scale level: in local communities, regions, countries, the global society. One type of societal change agents has recently attracted considerable attention: the *societal entrepreneur* (see for example Gawell, Johannisson, & Lundqvist, 2009). Societal entrepreneurs are here defined as people who (a) are committed to initiate *innovative* activities aiming at serving the good of the society (on some scale level: local communities, regions, countries, global society); (b) do it by organizing activities in new ways (rather than operating with existing organizations); and (c) seek changes that involve influencing how *other* actors and/or institutions operate (rather than just, like many *social* entrepreneurs, starting up a non-profit organization offering needed social services). Societal entrepreneurs are aiming to be agents of societal development, intent upon creating solutions to problems in the society or realize visions which serve societal needs. From a normative point of view, it can be argued that societal change agency is a critically important phenomenon, in particular in relation to "wicked issues." To the extent that the world at large as well as particular communities need to adapt and develop in order to serve the good of humanity, skillful agency of positive societal change is a topic that deserves careful study.

---

[2] I gratefully acknowledge many helpful suggestions made by a number of perceptive reviewers.

How can we better understand skillful change agency in relation to wicked issues? Is it possible to identify competences that significantly contribute to effectiveness in such societal change initiatives? Can we develop skillful ways to support the development of required skills? These are large questions that can be expected to sustain a field of research for a considerable time.

The specific purpose of this article is to develop an analytical framework for describing variations in the meaning-making patterns of societal change agents, in particular through considering the role of awareness.[3,4] One application of such a framework is analyses of the relationships between patterns of awareness on the one hand and constructions of visions, goals, and action strategies on the other hand. The phrase "meaning-making patterns" is used here in an open-ended, rather than strictly defined way, more or less synonymous with related concepts like consciousness structures, cognitive structures, action-logics, mindsets, frames of reference, perspectives, etc. All these words refer to the more durable, recognizable patterns in how a person (or a collective) constructs meaning. The reason I prefer "meaning-making patterns" to, for example, cognitive structures, is simply that this formulation so clearly points to the active construction of meaning going on in the mind.

What is to be Explained?

The framework presented below is intended to be useful in unpacking and explaining three phenomena:

a) The variability and complexity of the sets of visions and goals societal change agents strive to attain.
b) The variability in the strategies and actions employed by societal change agents in order to achieve their objectives.
c) The roles of various aspects of awareness in explaining successful outcomes in societal change initiatives regarding complex issues.

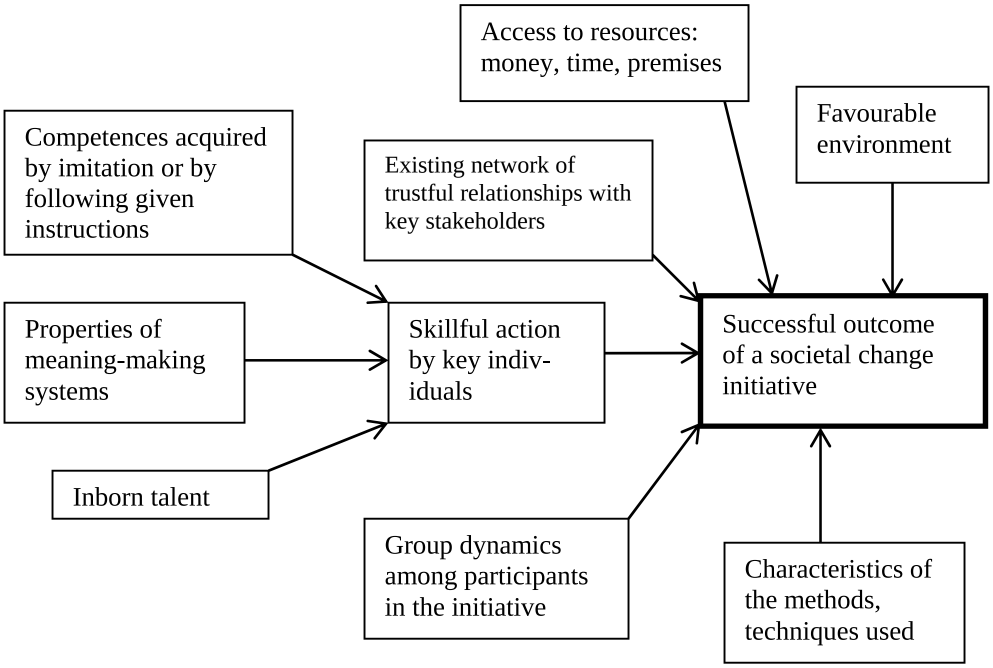
---

[3] The article is part of a three-year research project on transformations of meaning-making among societal change agents. The overall aim of the research project is to develop insight into how the development of capacity for constructively handling ill-structured, complex societal issues can be supported. The author of this article is the project leader.

[4] Barrett C. Brown (2011) explores a very similar thematic in his recent doctoral dissertation, but uses a quite different investigation strategy. His work became available when this article was almost finished and I choose not to explore the interesting implications of following different routes to develop knowledge about societal change agency from an adult development perspective here.

These three aspects of societal change agency are, of course, interdependent.

Figure 1 shows some alternative explanations to successful outcomes of societal change initiatives. In the figure, skillful action is depicted as one of six possible contributing factors to successful outcomes. Furthermore, skillful action is a phenomenon that may in itself have different contributing explanations. Here only three alternatives are named: acquired skills, properties of meaning-making systems, and inborn talent. Other perspectives are possible. Of course these different sources of causation can interact with each other as well, which is not depicted in the figure in order to avoid cluttering.[5]



Access to resources: money, time, premises
Favourable environment
Competences acquired by imitation or by following given instructions
Existing network of trustful relationships with key stakeholders
Properties of meaning-making systems
Skillful action by key indiv-iduals
Successful outcome of a societal change initiative
Inborn talent
Group dynamics among participants in the initiative
Characteristics of the methods, techniques used

Figure 1. Some explanations of successful outcomes of societal change initiatives

I will focus only on one of the factors that can be expected to play a role in explaining successful societal change agency, namely the properties of individuals' meaning-making systems. I am, of course, well aware that successful change agency can have other explanations than exceptional skills on the part of key individuals, as shown in Figure 1.

---

[5] One of the reviewers of the article manuscript cautioned against using unidirectional arrows since it presents a linear, oversimplified view of something that is actually very complex and nonlinear. I will trust the reader to recognize that several of the elements condition each other in far more complex ways than the model indicates.

Character of the Framework

A Pragmatic Rather than Theoretical Framework

Since the framework presented below may look like a general theoretical model of adult development, in particular since it refers heavily to a number of established models in the field, I think it is necessary to make a few comments on the intended character of the framework. The purpose of the framework is to facilitate the description and explanation of the different forms of societal change agency found in empirical data. We need a framework that is openended in terms of possibly discovering unexpected patterns of reasoning and acting. The framework is not intended to be a theoretical model that represents how people's consciousness is actually structured, but rather to be a pragmatically useful way of identifying relevant patterns in the cases we study. This favouring of practical usefulness rather than theoretical completeness and stringency has a number of consequences, as will become evident in the course of the exposition.

The task defined for this text is to integrate relevant concepts and models from adult development theory into a comprehensive analytical framework specifically adapted to the study of societal change agents. I want to provide an in-depth treatment of the topic, which means that the bulk of the article is a quite thorough exploration of selected elements of existing theoretical models and concepts. Having constructed such a comprehensive framework allows for detailed analyses of, for examples, interviews. However, it is also possible to make use of selected parts of the framework to make more focussed and less complex analyses of aspects of the thematic. Constructing an appropriate analytical framework is, in the context of our ongoing research, a phase of a process. Here, the focus will be the development of the analytical framework and no empirical analyses of examples will be offered at this stage.

Focus on Durable Patterns Rather than on the Ephemeral Nature of Attention

A crucial assumption underlying the framework is that there are (relatively) durable patterns to how a person's awareness operates. This assumption is central to ego development frameworks in general, such as Jane Loevinger's (1976) and Robert Kegan's (1982, 1994). The assumption certainly allows for situational variations in levels and organization of awareness, due to, for example, situational stress or how interested the individual is in the particular issue at hand. But the assumption of durable patterns focusses on that which is recognizable as recurring forms, rather than that which is situationally dependent. In ego development theory, adult development is described in terms of distinctive qualitative shifts in the very structure of meaning-making, shifts that might be described in the form of developmental stages. Most individuals advance in ego development stages until early adulthood and then stabilize in one of the conventional ego stages (Loevinger, 1976; Cohn, 1998). A minority shifts into postconventional stages. In one representative sample of the adult American population, less than 7 % were assessed at the three stages beyond the first postconventional stage, the Individualist. (Cook-Greuter, 2004). There are few longitudinal studies of development throughout adulthood (Helson & Roberts, 1994; Morros, 2001), but the fact that few adults reach the latest ego stages indicate that most people have access to a limited range of meaning-making structures over extended periods of their lives.

How the Framework Evolved

Theoretical Habitat

I have invested considerable time and effort since the mid-1980's in reading, reflecting on, and processing literature on adult development and consciousness development. This endeavour includes surveying large volumes of academic theory-building and empirical research on adult development, but also literature stemming from several of the world's major wisdom traditions, such as Buddhist and Vedic discourse. One of my goals in this work has been to develop a conceptual framework useful for analysing those differences in structures of meaning-making that contribute to explaining what happens in social conflicts, societal phenomena (such as crime, poverty, or environmental problems), political processes, organizational development, and related areas. In earlier research, I have experimented with different varieties of analytical frameworks for studying the developmental variability in geopolitical reasoning (Jordan, 1998), and meaning-making in workplace conflicts (Jordan & Lundin, 2002), defence and security politics (Jordan, 2001b; 2003) and organizational change initiatives (Jordan, 2006a).[6] In one study (Jordan & Lundin, 2002), I developed a complex model for describing and analysing individual differences in patterns of awareness, called the conflict awareness mandala. The model is a graphic representation of a typology covering twenty different themes and four levels of depth, in all 80 variables. In hindsight, I find the model far too complicated to be useful for other purposes than a theoretical understanding of the nature of awareness. I was very satisfied when I discovered that Bill Joiner and Stephen Josephs (2007) had developed very similar ideas about how to structure a practical model of different forms of awareness, but had arrived at a far more pedagogical framework than I had. The framework presented below owes very much, in particular in terms of the pedagogical structure, to Joiner's and Josephs' model in their book *Leadership Agility* (Joiner & Josephs, 2007). Joiner and Josephs have integrated models and insights from a wide spectrum of adult development literature into a framework designed to be useful for understanding and working with leadership development. The form of their framework is adapted to the kind of purpose and audience they wanted it to serve: professionals interested in coaching and organizational consulting rather than academic researchers. The outcome is a very pedagogical model, accessible to interested lay persons. One drawback of their writing strategy is that the packaging of the model obscures some significant theoretical contributions made in the book. In order to serve academic purposes well, Joiner's and Josephs's model needs some modifications. For this, and for a number of other reasons, the framework I present below differs from their model. The somewhat different approach I have taken in structuring an analytical framework has some costs in relation to Joiner's and Joseph's framework, but also, I think, some benefits. I will not detail the differences and explain the reasoning for them here, but rather focus on presenting and illustrating a specific adaptation.

Over time, I have borrowed concepts, models, and discourses from many different researchers and traditions and integrated them into my own evolving analytical framework. This article is a travel report of a certain part of this journey, where the learning I have been through so far is applied to the specific task of studying societal change agency.

---

[6] See also the interview with Thomas Jordan made by Russ Volckmann (2005) in *Integral Review* http://integral-review.org/documents/Good,%20Clever,%20and%20Wise%201,%202005.pdf .

Empirical Grounding

As hinted at above, the framework has a evolved over quite a long time, not only through theoretical studies but also in "dialogue" with empirical data. In four different research projects between 1999 and 2006, I and colleagues interviewed more than 130 persons with the aim of studying various aspects of their meaning-making on workplace conflicts (Jordan & Lundin, 2002), security policies (Jordan, 2001b, 2003) and organizational change agency (Jordan, 2006a). Different vintages of analytical frameworks drawing on adult development theory were used to analyze the data. After 2006 I and colleagues have carried out a number of comprehensive case studies of individuals and teams who have developed intriguing strategies for working with change related to wicked issues. Cases we studied involved crime prevention work in Gothenburg (Jordan, 2006b), integration of immigrant youth in a Gothenburg suburb (Andersson & Jordan, 2007), honour-related violence (Emanuelsson, 2011), development of a comprehensive strategy for dealing with the controversial issue of graffiti (Sander & Jordan, 2009), development of strategies for enabling suburban youth to make radio and TV programmes in Public Service channels (Sander & Jordan, 2011) and other issues. There is consequently a considerable amount of empirical data that has served as a sounding board for the gradual development of an analytical framework adapted to the specific needs of understanding societal change agency. However, in its present form, the framework has yet to be thoroughly field-tested.

Overview of the Framework

The framework outlined here is constructed by combining three ideas:

1. The idea that the meaning-making system of a societal change agent can be described meaningfully in terms of three aspects: *awareness, identifications,* and *action competences.*
2. The idea that a societal change agent can turn his or her attention, to varying degrees, in four basic directions, towards *the task*, *the context, the stakeholders*, and *the self*. When the turning of attention in one of these directions becomes a habit, we can speak of a particular form of awareness.
3. The idea that a societal change agent might to varying degrees "go *meta*," i.e., make his or her own and other people's *perspectives* into objects of awareness.

Conceptual frameworks are, almost always, reductionistic. They need to be, because we can keep track of only a limited number of mental representations at once. The artificial sorting of a messy reality using simplified concepts is useful, but is also always problematic in various ways. This caveat is particularly relevant when dealing with very complex and variable phenomena, such as the meaning-making systems of individuals. The distinction between awareness, identifications, and action competences made here *is* artificial in the sense that processes that are actually intimately interwoven are separated into categories. These categories are not here defined in ways that keep them neatly, logically separate from each other. I do believe, however, that the distinctions are meaningful and practical to work with, if used mindfully of the shortcomings of conceptual simplifications.

Awareness, Identifications, and Action Competences

Awareness

I will explain the meaning given to the category *awareness* in this framework by using a couple of closely related words. Awareness is here mostly used in the sense of awareness *of*, i.e., directing attention towards something and consciously *noticing* characteristics of the object of attention. However, the purpose of the conceptual framework discussed here is to serve for describing *durable patterns* of meaning-making, rather than single instances of perception in a certain moment. What is of interest is therefore what we might describe as *habits* in the individual's employment of his or her awareness. A slightly different angle is to think of the individual in terms of him or her having *expectations* about what might be worth looking for. A more academic way of expressing these expectations is to talk about *ontological assumptions* or *preunderstanding* (German: Vorverständnis). Examples of different types of ontological assumptions will be offered in later sections. Of course, most people look at the world through lenses of ontological assumptions without being aware of having such lenses. Becoming aware of and articulating ontological assumptions is a quite sophisticated cognitive task.

There is an intended connotation in the use of "awareness" as a key concept. A lack of awareness is not necessarily a result of a lack of *capacity* for processing information. Sometimes, weak awareness is simply a result of not having noticed or realized that turning attention towards a particular aspect can be useful. For example, an individual involved in a difficult conflict may be asked: "Why do you think she got so angry when you made your suggestion?" The asking of the question directs the individual's attention towards possible explanations of the reaction of the other person. The individual may simply have failed to reflect on this before, but when turning attention towards the question, it may be easy to come up with a plausible explanation. When individuals with weak awareness actually turn their attention towards a particular object, they may have no difficulties in apprehending what is to be apprehended, nor to process the information and make conclusions. Lack of capacity is a different matter. It signifies an inability to process information in a certain way (e.g., keeping track of many different aspects at once; actually understanding a causal principle and using it to deduce possible consequences; or seeing multiple causal connections which together form a system). Even if someone else points out the relevant circumstances and explains the causal connection, the mental processing capacity is not sufficient for accomplishing the task, at least not without a lot of support (scaffolding).

A lot of the research on development of social and psychological cognition (e.g., Gremmler-Fuhr, 2006; Jordan & Lundin, 2002; Krebs & van Hesteren, 1994; Selman, 1980) analyzes shifts in how, for example, persons and relationships are constructed. This is interesting and relevant, but I have often found that the crucial issue is not how something is constructed when the individual actually talks about it, but rather the failure to at all consider the matter. This non-reflection can be total, i.e., a complete disregard of something that might be highly relevant, or it can be partial, i.e., vague and unelaborated (Jordan & Lundin, 2002). This approach to the study of meaning-making means that noticing the absences of certain types of awareness can be central to understanding the character of a person's way of making sense of, say, a societal issue. The failure of an individual to notice that there are complex reasons for a particular problem can actually be a powerful explanation of the opinions and actions of that person.

Five Domains of Awareness in Social Settings

Figure 2 gives an overview of the five domains of awareness used in this framework for identifying salient properties of meaning-making structures among societal entrepreneurs. The simplest explanation of the model is to see awareness as a result of turning one's attention in different directions in order to allow more or less differentiated gestalts to form in one's field of vision. The formation of these gestalts makes mental work possible. One can deepen the perception of the object of attention, noticing finer details, differences, and similarities. One can start to reflect on possible causes of the present state of things, as well as hypothetically explore alternative future consequences. One can also start exploring possibilities for action: how to work with the present situation in productive ways.

When attention focuses on a certain *task*, the properties of this task become the object of attention. A task can be a work task, a specific problem or dilemma one is presented with, a vision one wants to realize, etc. I call this *task complexity awareness* because a key aspect of dealing with a task is to unpack the complexity relevant to the understanding of and dealing with the task.

In the opposite direction, attention can be directed towards the wider *context* of the task. This context has properties and these properties may condition the possibilities of managing the task successfully. People have different degrees of *context awareness,* i.e., they are more or less prone to turn attention toward the conditions of the wider environment of the present task.

In most cases related to societal change agents' interests, task completion cannot be reached by autonomous action, but there are usually different *stakeholders* the change agents need to interact with for various reasons. Stakeholders may, for example, control resources needed for achieving one's objectives, they may react and act in various ways that influence task completion, or they may have power to block certain things from happening. *Stakeholder awareness* is the result of turning one's attention toward relevant stakeholders in order to understand who they are, what their interests are, and how best to relate to them.

The fourth direction of the model is the *self*. *Self-awareness* means turning attention towards the processes going on inside oneself, in order to notice what kinds of thoughts, feelings, and desires are tumbling through one's own self.

In addition to the four attention directions of the base model, a fifth awareness category has been added, *perspective awareness.* This category seems necessary in order to name a very significant aspect of meaning-making: taking the *patterns* of meaning-making of oneself and others as objects of attention.

Figure 2. Five types of awareness
Adapted from Joiner & Josephs, 2007 and Jordan & Lundin, 2002.

Identifications

While *awareness* focuses what a person notices and fails to notice, *identifications* focusses what a person feels committed to: what feels important (desires, goals, visions, values, etc.) and what is felt to be "I" and "We."[7] This includes what, in Robert Kegan's (1982, 1994) languaging, is *subject* to a person and therefore forms the core of the identity. The category *awareness* is used for asking questions about what a person is aware of, which does not necessarily tell us anything about a person's motivation, such as visions, engagement, commitments, etc. There are strong interrelationships between awareness and identifications, since the gestalts formed in awareness can be highly significant for how goals, visions and commitments are constructed. This theme will be further explored in later sections.

---

[7] Joiner and Josephs (2007) build their framework around the conceptual pair of *awareness* and *intent.* In the present framework, what Joiner and Josephs refer to as *intent* is included in the category *identifications,* but the latter category also comprises constructions of self.

Action Competences

Action competences focuses attention on the competences a person can actually make use of when working with tasks, solving problems, and trying to realize visions. Action competences can be processes going on within one's mind, e.g., skills in developing creative solutions to tricky problems or techniques for managing one's own emotional reactions. Other action competences really involve outward behaviour, e.g., communicative skills in creating trustful relationships with other people.

Five Domains of Awareness, Identifications and Action Competences

Table 1 gives a schematical overview of the framework generated by combining the five domains of awareness with the distinction between awareness, identifications and action competences.

Table 1. Schematical overview of the analytical framework

	Awareness	Identifications	Action competences
Task	Task complexity awareness	Construction of and commitment to worthy tasks	Competence in managing task complexity
Context	Context awareness	Scope of caring	Competence in locating the "room of manoeuvre"
Stakeholders	Stakeholder awareness	Goals relating to stakeholders	Social action competences: building relationships, influencing people
Self	Self-awareness	Ego needs, self-transformation goals	Strategies for managing interior processes and structures
Perspectives	Perspective awareness	Embeddedness in-disembedding from perspectives; Goals relating to transforming perspectives	Skills in using contrasting perspectives for insight and problem-solving

In Part II of the article, each of these five types of awareness will be presented in a comprehensive way, also referring to relevant models, theories, and concepts developed by researchers in the adult development field. After the completion of this discourse-building, Part III will deal with the more practical work of putting the framework to use in analyses.

Choices in the Design of an Analytical Framework

When studying very complex phenomena, in this case meaning-making in the context of societal change agency, choices must be made, for example between designing a framework for a high level of theoretical stringency or for versatility in encompassing a wide variety of different aspects. It is seldom possible to optimize an analytical framework towards all desirable qualities. The framework outlined here sacrifices theoretical stringency for flexibility and openendedness. I believe that the choice to operate with five different awareness categories is useful for identifying significant patterns of meaning-making in real-life contexts. The division of awareness into five different categories *is,* however, artificial. For example, the aspects described in the category *task complexity awareness* are integral parts of aspects of the other categories as well. Some would argue that stakeholders are a salient part of the context. However, when studying the particulars of people's meaning-making, it makes good sense to treat awareness of significant other persons separately from awareness of the conditions of the wider environment. Furthermore, perspective awareness is, it could be argued, a particular case of systemic complexity awareness applied to awareness of self and of stakeholders. Consequently, the framework is designed to serve the function of facilitating the identification of different aspects of meaning-making among societal change agents, rather than offering a consistent theory of how awareness is structured.

Multidimensional Frameworks

Readers familiar with the "integral studies" field, or with adult development research in general, know that many of us grapple with how to deal with the topic of "lines of development." Is it sensible to conceptualize adult development in terms of several distinct, if somehow also interdependent, lines of development? Or is the self, as is sometimes assumed in ego development theory, a "structured whole," a system that develops and transforms *as* a system in recognizable stages. Or does it make more sense to try to find the common underlying variable (e.g., levels of complexity) that can explain patterns of development in different domains?

Ken Wilber has been a pioneer in pointing to the existence of multiple "lines of development" and in starting to consider how these different dimensions of consciousness development are interrelated (e.g., Wilber, 1995, 1997, 1999, 2006).[8] However, Wilber's contribution has mainly been to point out the general patterns and issues in consciousness development. Fashioning the details of an analytical framework out of his often penetrating insights has been left to others. People inspired by Wilber's way of conceptualizing different dimensions of development have started to develop frameworks outlining the "lines of development" they consider relevant to their own field of inquiry or practice. Most such efforts concern the field of psychotherapy (e.g., Esbjörn-Hargens, 2010; Forman, 2010; Ingersoll & Zeitler, 2010; Marquis, 2008) and are conceived in terms of choosing lines of development and then defining stages in each line. One of the most ambitious efforts along these lines (although with a weak or no relation to Wilber's framework) is the *Manual for Faith Development Research* (Fowler, Streib, & Keller, 2004). This manual describes seven different aspects of development with coding criteria for six developmental stages for each aspect.[9] The framework is, of course, designed to allow a differentiated analysis of meaning-making in the realm of (religious) faith. Many of the aspects are, sometimes with some adaptation, relevant also to other areas of meaning-making.

The approach taken in this article is, however, different. Rather than operating with quasi-independent lines of development, the framework is constructed from the notion of varying degrees of awareness, put to work with different objects of attention. Rather than defining stages, this framework is openended, in order to be flexible in relation to the actual patterns presented by the cases we study.

---

[8] See also Jordan, 2000.

[9] The seven aspects are: Form of logic, Social perspective taking, Form of moral judgment, Bounds of social awareness, Locus of authority, Form of world coherence, and Symbolic function.

Readers interested in different ways to handle the multidimensionality of adult development might want to study the work of Otto Laske (2006, 2009). Laske has made a very ambitious effort to integrate theoretical constructs of, among others, Kegan, Jaques, Basseches, and King & Kitchener into a comprehensive multidimensional framework. His specific application is developmental coaching, but the theoretical project is probably the most ambitious effort thus far to differentiate and integrate cognitive, socio-emotional, and epistemological dimensions of adult development into a sophisticated theoretical framework. In our context, however, Laske's theoretical framework and methods are too complicated and time-consuming to be practicable.

PART II: FIVE DOMAINS OF AWARENESS

Introductory Notes

In the following sections, the discourse defining each of the five types of awareness is elaborated using the same basic pattern. First, an explanation of the meaning given to the respective type of awareness is offered. Secondly, a discourse for relevant distinctions is developed, drawing on a number of models and frameworks from the adult development field. The distinctions offered in these subsections constitute patterns to look for in, for example, interviews made with societal change agents. Thirdly, some observations on how variations in the forms of awareness in each of the domains relate to possible patterns of identifications are offered. Lastly, some comments are made on how each domain of awareness also forms the basis of useful action competences in the field of societal change agency.[10]

The first section, on task complexity awareness, is considerably more comprehensive than the following four. The reason for this is that awareness of complexity is a fundamental aspect of awareness in all domains and is therefore given extra care.[11] So while theoretical models describing various aspects of meaning-making relating to complexity are presented in the section on task complexity awareness, the other sections build on these models as well.

Task Complexity Awareness

Task complexity awareness describes to what extent a person notices, expects, and can handle the complexity of a task. I discern three aspects of complexity awareness.

1. The noticing of and interest in *compoundedness* and *variability*. This aspect concerns the extent to which a person actively notices a spectrum of varying conditions, circumstances and characteristics that might possibly be of significance for the interpretation of the situation when taking on a task. The gestalts constructed of a task, a situation, or an event can be more or less elaborated in terms of compoundedness, nuances, and attention to

---

[10] A lot of plain assertions are made in the following. This form is used for convenience and fluency and should not be read as truth claims, but rather as plausible assumptions (often based, however, on a considerable body of knowledge).

[11] But, as I hope will be apparent in the following, there are also aspects of the various types of awareness that cannot be accounted for in a satisfying way by assimilating them into a pure model of hierarchical complexity. See for example the section on self-awareness below.

potentially significant details.

2. The noticing of and interest in underlying *causal connections* at various levels of complexity. This aspect concerns to what extent different elements are seen as connected to each other through causal relationships that might offer meaningful explanations of events and allow reasoning about possible future consequences of present conditions. Causation of social and psychological phenomena can often be conceived of as nested in layers of increasing complexity, of which an individual may be more or less aware.

3. The noticing of and construction of mental representations of *abstract properties*. This aspect concerns the acquisition of a conceptual repertoire for reasoning in terms of qualities that are far removed from concrete, tangible actions and objects. Concepts at high levels of abstraction can, for example, be words for qualities that are common to many different-looking occurrences (e.g., "authenticity"), or be formulations that describe properties of complex systems (e.g., "a vicious circle of depopulation").

When taking on a task, a person may have more or less complexity awareness at his or her disposal. Complexity awareness can also be more or less consolidated. The first step of complexity awareness is the *noticing* of different aspects of complexity. Sometimes there are circumstances that, so to speak, call for attention by being obnoxious hindrances or obviously relevant explanations. A person might become aware of some of the complexity of the issue when prompted in this way, but still be relatively oblivious of the uses of actively exploring complexity without being prompted. A further step in the consolidation of complexity awareness is therefore having the *expectation* that things may be complex, i.e., being aware of the possibility that there might be significant circumstances, causal relationships, potential consequences, and systemic characteristics that might explain occurrences and that might be useful to consider when deciding on a course of action. Above, I also referred to such expectations as *ontological assumptions* or *preunderstanding*, i.e., general, mostly unreflected, assumptions about the nature of reality. An ontological assumption about the ever-present complexity of most issues means that an individual without prompting expects and looks for significant circumstances and underlying causes.

The expectation of complexity and the habit of reflecting on complexity usually leads to the accumulation of a *repertoire of concepts, ideas, thought forms* (Basseches's "schemata," see below) *and generic questions* about what to expect and look for, such as a set of ideas about what circumstances to look for, what explanations might be relevant, what properties of systems might play a role. Having a vocabulary of meaningful words for naming properties of complex relations can be seen as an important support for complexity awareness.

A keen complexity awareness can lead to the development of actual *action competences* in dealing with complexity. Action competences include being able to construct and operate with mental representations of complex interrelationships between a number of conditions, causes, and system properties, so that more effective strategies, courses of action, and solutions can be developed by taking the complexity of the issue into account.

As has been alluded to before, the *absence* of complexity awareness is as significant as the presence of the same. If a person does not notice complexity, this will have profound consequences for how he or she makes sense of the issue at hand and consequently also for how he or she handles it.

Potentially Helpful Conceptualizations in the Adult Development Literature

The issue of complexity in mental processing has attracted a lot of attention among researchers in the adult development field.[12] The models and concepts of hierarchical complexity developed by researchers in the adult development field (e.g., Kurt Fischer and Michael Commons) cannot be properly understood without a good grasp of the entire discourse the models and concepts refer to. I will here only point to some conceptualizations that may be useful for recognizing patterns in the meaning-making of societal change agents. For a fuller understanding of hierarchical complexity theory, the reader is referred to the core texts (see footnote).[13]

Researchers writing about hierarchical complexity have tried to find appropriate names for various properties of reasoning structures and abstraction levels. Often, several different names have been used to cover the same phenomenon.[14] It is hard to find (and agree on) names that are descriptive of the properties one wants to have a name for, without them having misleading connotations. Each author has his or her reasons for preferring some names to others. I will add to the confusion by picking the names from different models that I find most appropriate.

Models of Hierarchical Complexity

There is a considerable literature on two closely related theoretical models for describing hierarchical complexity. One is Kurt Fischer's skill theory (Fischer, 1980; Fischer & Bidell, 2006), which has been developed further in various ways by Theo Dawson and her colleagues (the Lectical Assessment System, LAS, e.g., Dawson & Gabrielian, 2003; Dawson & Wilson, 2004).[15] The other model is the Model of Hierarchical Complexity (MHC), developed by Michael Commons and his colleagues (see e.g., Commons, 2008; Commons & Richards, 1984, 2002; and

---

[12] The first aspect of complexity awareness mentioned above, concerning compoundedness and variability, is an important theme in Jane Loevinger's descriptions of the stages of ego development (e.g., the ego development scoring manual, Hy & Loevinger, 1996). However, Loevinger did not go far beyond inductively derived stage descriptions in theorizing about increasing complexity as an important aspect of ego development.

[13] Fischer, 1980; Fischer & Bidell, 2006; Dawson-Tunik et al. 2005; Commons, 2008; Commons & Richards, 1984, 2002; Commons et al., 1998. Elliott Jaques offers an alternative framework, less stringently defined, but with striking similarities to Fischer's and Common's model (Jaques, 1998; Jaques & Cason, 1994).

[14] Not seldom the same author uses different names for the same phenomenon in different texts. Elliott Jaques, for example, used *declarative* and *assertive* to describe the same form of mental processing, and Theo Dawson has experimented with a variety of names for both structures of reasoning and orders of abstraction, finally deciding on just using numbers.

[15] Many of Kurt Fischer's articles, book chapters and other texts are available (as of August 2010) at this website:
http://www.gse.harvard.edu/faculty_research/profiles/profile.shtml?vperson_id=335
Texts by Theo Dawson and her colleagues are available (as of August 2010) at this website (see under "About us"): http://devtestservice.org/

Commons, Trudeau, Stein, Richards, & Kraus, 1998).[16] Both models describe a hierarchy of increasing complexity.

These models have the advantage of being stringently defined, which make them valuable in research endeavours that aim for high degrees of stringency in measurement and analysis. However, using these frameworks requires a thorough understanding of a quite complex theoretical discourse and considerable training to acquire reliable scoring skills. The actual scoring of interview transcripts is also a time-consuming procedure. Scoring yields stage scores. These can be useful for comparative purposes, for measuring change over time, and for additional insights in interpreting qualitative data. The advantages of stage scoring consequently come at considerable costs in terms of the time that has to be invested in training, scoring, and interpretation of the results. However, I believe that the distinctions made in the hierarchical complexity frameworks can be useful also in less meticulous, more qualitatively oriented analyses of discourse. In the following two sections, I will present two sets of conceptualizations that I deem potentially useful for recognizing structural properties of the meaning-making of societal change agents. The first is Elliott Jaques's description of four forms of mental processing, the other is the five MHC stages relevant to the vast majority of adult forms of reasoning. Both models are hierarchical, i.e., the forms/stages that come later build upon successful completion of the previous form/stage.

Four Forms of Reasoning about Tasks

Kurt Fischer and Elliott Jaques both noticed that there are some basic forms of thinking that can be recognized in a wide variety of contexts. They developed quite, but not entirely, similar conceptualizations for describing those forms. Fischer's discourse is more stringently grounded in clear definitions (Fischer, 1980; Fischer & Bidell, 2006), while Jaques's typology is probably more accessible to those who are not intimately familiar with Piagetian discourse. Jaques describes four basic "forms of mental processing" that can be recognized when an individual talks about how to handle a particular task.[17]

> **Declarative Processing:** a person argues his or her position by bringing forward a number of separate reasons for it. The reasons are separate in the sense that each is brought forward individually, on its own, and no connection is made with any of the other reasons; for example, "Here's one reason for my idea, here's another, I could give you others as well." This method of processing has a disjunctive, declarative quality.
>
> **Cumulative Processing:** a person argues his or her position by bringing together a number of different ideas, none of which is sufficient to make the case, but taken together, they do; for example, a detective might argue, "If you take this first point (clue), and put it together with these three other items we have observed, then it becomes clear that such-and-such has occurred." This method of processing has a pulled-together, conjunctive quality.

---

[16] Articles, papers, dissertations and other texts by Michael Commons and his colleagues are available at: http://www.dareassociation.org/

[17] Jaques and Fischer both constructed models where a sequence of basic *forms* of mental processing repeated itself on several orders of increasing abstraction, thereby defining a relatively large number of stages.

> **Serial Processing:** a person argues his or her position by constructing a line of thought made up of a sequence of reasons, each one of which leads on to the next, thus creating a chain of linked reasons; for example, "I would do A because it would lead to B, and B will lead on to C, and C would lead on to where we want to get." This method of processing has a conditional quality in the sense that each reason in the series sets the conditions that lead to the next reason.
>
> **Parallel Processing:** a person argues his or her position by examining a number of other possible positions as well, each arrived at by means of serial processing. The several lines of thought are held in parallel and can be linked to each other. It becomes possible to take useful points from less favored positions to bolster up a favored one. This method of processing has a double conditional quality, in the sense that the various scenarios are not only linked with each other, but they can condition each other as well. (Jaques, 1998, p. 22)

Declarative forms of reasoning mean that the speaker makes assertions and states opinions, but does not justify assertions by offering explanations of the underlying causal principles. If asked for justifications, the individual often responds by adding new assertions, rather than pointing to how things fit together. In *cumulative* processing, the individual notices that there are different circumstances that need to be taken into consideration to make a good judgment. There is consequently an independent processing of a number of situation-specific factors that leads to a conclusion about how to handle an issue. In *serial* processing, attention is turned towards causal relationships. An understanding of the principles of (linear) causation involved invites hypothetical reasoning: deducing possible consequences of alternative courses of action as a method for choosing an appropriate problem-solving strategy. In the light of other theoretical frameworks, Jaques's conception of *parallel* processing seems a bit idiosyncratic. Fischer, Dawson and Commons speak of *multivariate* or *systems* reasoning as the natural next level of complexity after serial/linear reasoning. The essential quality of more complex forms of reasoning is that several interacting elements are kept in mind simultaneously, not only in unidirectional series of cause-and-effect relationships, but as having mutually conditioning complex relationships to each other.

For our purposes, it is relevant to look for the structure of reasoning when societal change agents are grappling with ill-structured issues. I will, however, make a mixed selection regarding the terminology. *Declarative* reasoning means that ideas are asserted without a consideration of underlying causative processes. People reasoning in a declarative way may provide what they consider to be explanations, but these explanations are only assertions about fixed properties, not explanations of causal principles. The notion of *cumulative* reasoning could assist us in noticing when respondents make elaborated comments about a variety of specific circumstances that need to be weighed in when handling issues, but do not in a deeper way consider causal processes. Characteristic of *linear* reasoning is when people as centers of their strategy-making have ideas about significant cause-and-effect chains, but keep their focus on single unidirectional chains. A person who considers multiple relations that are seen to hang together in systematic ways uses *systemic* reasoning (see also the explanation of the *metasystematical* stage in next section).

The Model of Hierarchical Complexity

The Model of Hierarchical Complexity (MHC) is a mathematics-based general theory of levels of task complexity.[18] It accounts for a series of levels of increasing complexity of tasks (and in particular stages of task performance). Each new level is defined in terms of coordination of tasks of the preceding level. An important characteristic of the model is that it is content-free. Hereby, the model allows a stringent classification of a single aspect: the level of complexity of a task. This property of the model makes it possible to make measurements of, for example, the complexity level of a person's effort to solve a problem through reasoning. The model can also be used for comparing different models that describe stages of development in a particular field (e.g., moral reasoning, reflective judgement, ego development). For our purposes, the MHC can be useful as an approach to discerning the complexity of reasoning about a particular problem or vision that engages a societal change agent. The MHC comprises 15 stages, but only five of them are relevant in relation to the patterns of thinking about tasks one generally encounters among adults.

The following is a brief presentation of the relevant MHC stages as they can be recognized in discourse about social issues.[19]

Concrete (Stage 8)

At the concrete stage, thinking and talk is narratives about concrete, specific things, people, acts, events and places. The concrete stage is, when found in adults' thinking and talk, perhaps best understood in terms of what is absent. Experience is not processed into generalizations, where the concrete events would be seen as specific instances of classes of things, people, acts, etc. (abstract stage). Nor would more complex mental representations be used, such as conceptualizations of abstract causal relations (formal stage). Thus, talk is dominated by narratives about the specific (often what is concretely experienced in daily life). For example, a group of people who are concerned about problems in their neighbourhood and start talking about them can go on talking for a very long time about one specific incident after another. At the concrete stage, they do not summarize the different specific incidents into thematic categories. However, at the next, abstract stage, they could formulate their concerns in general terms, like for example: "–We ought to do something about misbehaving youth in our neighbourhood."

Abstract (Stage 9)

Thinking at the abstract stage is characterized by the use of categories that are abstracted from specific things, people, acts and events. The construction of abstractions makes it possible to talk about concrete things, people, acts, and events *in general,* i.e., to form categories and generalize about them. Abstractions are categories for something that can vary, i.e., take on different forms and properties within the broader characteristics described by the category (Fischer, 1980, p.

---

[18] I gratefully acknowledge constructive comments and suggestions by Sara N. Ross on this section. I haven't always followed her advice, though, so any misrepresentation remaining is my own sole responsibility.

[19] The stage descriptions here are compiled and adapted from a number of different articles and documents about MHC, including unpublished course material generously shared by Sara N. Ross.

481ff). Since cognition confined to the abstract stage and below does not make use of generalized conceptions of cause-and-effect relationships, conversation about problems at this stage is dominated by plain assertions and value judgments (opinions). There is no effort to justify propositions by offering arguments about underlying causes and principles. If explanations are provided, they are simply other assertions. Referring to Jaques' terminology, the abstract stage makes use of declarative mental processing: there is no real coordination of conditions, circumstances or causal relationships – each assertion, opinion and belief stands for itself.

Formal (Stage 10)

Reasoning at the formal stage makes use of mental representations of generalized *relations* between or among abstract categories, i.e., conceptions about how different abstractions are causally or otherwise connected to each other. In Jaques' terminology, the formal stage is characterised by serial mental processing of abstractions. A common way of describing the essence of formal reasoning is that "if-then" statements are formulated by putting two or more abstractions into logical relationship. The mental representations of abstracted relations allow for hypothetical reasoning. A person using formal reasoning can, in his or her mind, make experiments. Assuming a certain action, consequences can be deduced by referring to an idea about the causal relations involved. When issues are processed at the formal stage, people ask for evidence and explanations and critically scrutinize whether a statement is consistent with other accepted facts or logical arguments.

The limitation of formal reasoning is the linear character of the arguments. Attention is focused on one variable that stands in some type of linear relationship to one or more other variables. The relationship is thought of as unidirectional: one thing causes another. One can look for causes of events, or consider possible consequences of a certain condition. However, in formal reasoning there is an absence of conceptions of co-dependent causation involving multiple variables.

Systematic (Stage 11)

In reasoning at the systematic stage, multiple formal conceptions are coordinated into mental representations of complex relationships, forming systems.[20] In a system, elements can condition each other in complex ways that are not reducible to linear causal relationships. In formal stage reasoning, only one unidirectional causal relationship at a time is considered, whereas in systematic reasoning a system of multiple formal relationships is considered simultaneously. Characteristic of systematic reasoning are such factors as consideration of the function of a single element in a larger system, feedback loops and interacting conditions and causal factors. People who use systematic stage reasoning about an issue usually need more comprehensive statements in order to do justice to their conception of what they perceive as relevant conditions, causes and consequences.

---

[20] Jaques' *parallel* mental processing describes one form of systematic reasoning about abstractions. However, I believe that Fischer's terms *multivariate*or *systems* reasoning better capture the spectrum of forms of systematic reasoning.

Metasystematic (Stage 12)

At the metasystematic stage, mental representations of whole systems *as* systems are constructed, allowing the subject to describe systems as integral wholes, compare systems to other systems and reflect on how different systems are related to each other. Taking systems as wholes as objects of attention allows for understanding of the properties of systems, i.e., properties that are not reducible to the properties of relations between the elements of the system but exist or arise as a consequence of the structure and the interaction patterns of the system as a whole. A common outcome of metasystematic thinking is that systems, strategies and complex processes are named with designations that describe their key properties. Another is that metasystematic thinkers often look for high-level principles that are valid across different systems. Examples of this would be "transcendent" values that are valid beyond the concrete beliefs in different religions or ideologies, or principles that describe similarities and differences between different types of complex social systems.

Metasystematic reasoning can lead to the construction of "metasystems," i.e., conceptualizations that coordinate two or more systems. One important form of metasystematic reasoning is when a person reflects on the properties of *perspectives* as complex systems of ideas. This enables the further metasystematic consideration of how the contrast and tension between different interpretive lenses can be used for gaining further insight into complex issues. Metasystematic reasoning in relation to perspectives is further discussed in the section on perspective awareness below.

The distinctions made in the MHC as summarized above may be useful for recognizing patterns of reasoning among societal change agents.[21] As is pointed out repeatedly in this article, it is usually instructive not only to look for the structure of what is actually said by respondents, but also to look for what is absent in their discourse about their work. In particular, it can be elucidating to look for the following forms of reasoning:

1. Formulations of principles of cause-and-effect relationships that are actively used to interpret an issue and to develop ideas about appropriate courses of actions to prevent or solve a complex problem or achieve an end that requires that a whole chain of cause-and-effect relations is set in motion.

2. Formulations of systemic properties, i.e., descriptions of the properties of various types of social systems (including organizational structures) and the consequences of these properties, as well as how such conceptualizations may influence the formulation of goals, visions and values.

3. Formulations of values at high levels of abstraction, what could be called "existential concerns," i.e., values and concerns that are of a more or less universal human character. Typical formulations include "ensure that human dignity is respected," "create conditions for creative processes," "make it possible for people to have rich lives," "reduce suffering," and "enable developmental transformation of people."

---

[21] See also the "Scale of Public Interactions," developed by Sara N. Ross and Jan Inglis (Inglis, 2007). The scale draws on MHC and describes five types of group communication about societal concerns.

If these three forms of more abstract reasoning are conspicuously *absent*, this certainly has consequences for goals and strategies in societal change agency.

Dialectical Reasoning

Different conceptual frameworks for describing and analysing more complex forms of meaning-making emphasize different features. The MHC and LAS focus the development of skills in cognitively keeping track of coordinations on increasingly complex levels. This means that they describe a *control* aspect of levels of cognitive complexity. The later stages in the MHC are characterized by a capacity to construct mental representations that keep track of and actively coordinate very complex interrelationships: systems of relations; systems of systems, and systems of systems of systems. Michael Basseches (1984), in his seminal work on dialectical thinking, made a dedicated effort to describe how more sophisticated forms of reasoning reflect a dialectical view of reality.[22] He found 24 dialectical schemata, "movements of thought," characteristic of a dialectical outlook. Basseches's framework, in contrast to the MHC, focuses the recognition of *limits to control* that he finds is characteristic of more sophisticated forms of meaning-making. A summary of the typical traits of a dialectical worldview is offered in the manual for coding dialectical thinking that is a part of Michael Bopp's doctoral dissertation:

> A dialectical world-outlook can be understood as a view of the nature of existence and/or knowledge which emphasizes their instability, their wholeness, and their composition by internal relationships. In ontological terms, instability pertains to the view that existence is not seen as composed of fixed, unchanging elements (monads), but rather as consisting of ongoing processes of becoming in which old forms give way to new, emergent forms. Likewise, from an epistemological point of view, knowledge is not seen as the accumulation of fixed, unchanging facts or ideas, but rather as active processes of conceptually organizing and reorganizing phenomena.
>
> Ontological wholeness is asserted in a tendency toward viewing existence as a unitary whole in the process of differentiating itself. This contrasts with the view that separates existence into monadic elements which are taken to exist as individuals, independently of each other. Epistemological wholeness is asserted in a tendency toward focusing on the structure and functioning of knowledge (or the conceptual system) as a whole, rather than dividing knowledge into facts or ideas which are viewed as mutually independent.
>
> The idea of composition by internal relationships ties together the focus on change over time with the focus on wholeness or organization. Composition by internal relationships refers to a "dialectical" process by which a whole changes or evolves over time through the changing relationships of its parts. These relationships are seen as "internal relations," meaning that the relations of the parts within the whole make the parts what they are […]. Within the dialectical world-outlook, this process of composition by internal relationships can be taken to describe the development of either existence or knowledge. (Bopp & Basseches, 1984, pp. 453-454, emphasis in original)

---

[22] Recently, Otto Laske (2009) has taken up Basseches framework and used it as one of several components in his multidimensional framework. Laske also developed a comprehensive and very useful scoring manual for dialectical thinking, based on Basseches work (see last part of Laske, 2009).

Bopp and Basseches thus point to three distinctive, but intimately related, features of dialectical reasoning. I prefer a somewhat different terminology for the same qualities. Expressed in other terms, higher levels of complexity awareness typically result in a set of ontological assumptions regarding three aspects of reality.

Processes: Things change. Everything has a past, a present and a future, i.e., is embedded in processes of change. In a dialectical worldview, there is an *expectation* that there are different long- and short-term change processes going on that might have to be considered in order to make good judgments about how to deal with a specific concern or task.

Systems: Issues are embedded in larger contexts that have systemic properties. A systemic awareness means that the *relationship* between the specific issue and the system it is embedded in is a distinct gestalt in awareness. The properties, structures, and change patterns of the larger context may have significant consequences for understanding and managing specific tasks.

Relationships: Relationships have their own properties, which cannot be reduced to properties of the parties/elements. Sometimes relationships are constitutive of a phenomenon, i.e., a thing is what it is only through its relationship to something else. The properties of relationships can be described. These properties can be causes, i.e., they can be significant explanations to what happens and what doesn't happen. The properties of relationships can change over time, not least as a result of intentional efforts to transform the properties of relationships by one or several of the parties.

To these three basic components of a dialectical worldview, I would like to add a fourth.

Perspectives: How one makes sense of an issue is inextricably dependent on the properties of the perspective(s) the sense-making is embedded in. Insight into the nature of one's own and others' perspectives is therefore an integral concern in any endeavour. This fourth component of dialectical thinking is clearly articulated in Basseches framework, but is there treated as part of the system/context dimension. I think it deserves being emphasized as a very significant part of dialectical thinking on its own. I will return to this topic in more detail in the section on perspective awareness below.

Before the shift into a dialectical worldview, people tend to see issues in more or less separate ways. Issues are dealt with without considering how they are embedded in a larger (dynamic) context, how they stand in relationship to other issues and levels, and how they have a different meaning when viewed with the lenses of different perspectives. The range of causal relationships considered is usually limited.

With strongly developed complexity awareness, grounded in a dialectical worldview, people generally develop a repertoire of concepts and more complex formulas for naming and describing characteristics of (a) processes of change (e.g., gentrification, individuation, conflict escalation, phases of group development); (b) properties of systems and structures (e.g., machine bureaucracy, learning organization, culture of honour); (c) properties of relationships (e.g., trustful, dynamic, patron-client relationship); and (d) properties of perspectives (e.g., idiographic vs. nomothetic sciences, dialectical worldview, dualistic mindset, postconventional morality).

Task Complexity Awareness as a Basis for Identifications

The level of complexity awareness in relation to tasks is central to what a person feels is important to attend to. Figure 3 illustrates this in a simplified way. The figure points to the possible differences in the complexity level of constructions of tasks. For one person, the task to deal with is a very concrete problem or vision. Attention is focussed on how to eliminate a problem or on how to realize an idea about something that could be. The strategy this person pursues may be seen by another person as attending to symptoms, while the significant causes that create a problem are left unattended. The second person would want to do something about the underlying causal processes that generate the troubling problem, or to initiate causal processes that lead to the realization of a desired outcome.

If attention is directed only towards
the concrete, visible problem,
it is likely that measures taken will deal with the immediate visible problem.

If attention is directed towards
the underlying causes creating the problem,
it is likely that measures taken will also deal with the underlying causes of the problem.

If attention is directed towards
the properties of the system in which the problem arises,
it is likely that measures taken will also aim at influencing systemic properties.

If attention is directed towards
the different perspectives that might contribute to understand the complexity of the problem,
it is likely that measures taken will also aim at influencing the stakeholders' ways of interpreting the problem.

Figure 3. Relations between awareness of complexity and type of problem-solving strategy
Adapted from Jordan & Andersson (2010)

Bill Joiner and Stephen Josephs (see Table 2) offer a different perspective on how identifications, in the sense of what is felt to be important, transform character in the course of adult development.

Joiner's and Josephs's formulations give an example of how aspirations are coloured and transformed by more complex, dialectical, and abstract conceptions. From a focus on achieving concrete results, the individual's attention is shifted towards engaging in fluid processes in a way that serves existential values (*cf.* Basseches's description of dialectical thinking).

Table 2. Constructions of what is desirable in five stages of development

Stage	Intent
Expert	To improve and accomplish things
Achiever	To achieve desired outcomes in a way consistent with self-chosen values
Catalyst	To create contexts and facilitate processes that are experienced as meaningful and satisfying and that enable the sustained achievement of desired outcomes
Co-Creator	To tap into an evolving sense of life purpose and actualize it in your everyday life through deep collaboration with others

Stage	**Intent**
Synergist	To engage with life in all its fullness and to be of benefit to others as well as yourself

Note: From Joiner & Josephs, 2007, pp. 213-214.

Action Competences Related to Complexity Awareness

When studying the meaning-making of societal change agents, it is important not only to look for signs of awareness of complexity, but to try to find out to what extent the individual demonstrates competence in *working* with complexity in creative and independent ways. Bill Torbert's concept *action inquiry* is highly relevant for describing action competences relating to complexity (Torbert & Associates, 2004). Action inquiry means actively inquirying into the complexity of issues, continually learning more, reevaluating one's own assumptions, and experimenting with different strategies in order to deal skillfully with significant tasks.

Context Awareness

Context awareness relates to the *scope* of awareness in terms of how much of the wider context a person actively notices and considers. Each task, each initiative is embedded in layers of context, such as a work group, an organizational unit, organizational structures and cultures, a society with certain characteristics, a global system. Noticing the properties and processes of change in the broader environment might be of crucial importance for carrying out one's own tasks. Changing conditions in the wider context might influence the possibilities, opportunities, and impediments for the specific tasks one is engaged in. What oneself and one's colleagues do might have consequences for the larger system and might therefore elicit reactions and changed conditions. Context awareness entails a capacity to shift focus between micro and macro levels and relate them to each other.[23]

The simplest forms of context awareness are to notice properties of the wider context that are of apparent significance to one's own doings. For example, a societal change agent could notice that since an election is coming up, it might be wise to postpone lobbying for a proposal until after the election as everyone's attention is focussed on the election process. A more consolidated context awareness means that there is a generalized expectation that all issues are embedded in larger contexts and that it is important to keep an eye on what is going on in this larger context, because such conditions and patterns of change may need to be taken into consideration when managing one's own tasks. One of Michael Basseches’s dialectical schemata is a good description of context awareness consolidated into the ontological assumptions of a person. The schema is called *Location of an element or phenomenon within the whole(s) of which it is a part*. Basseches writes:

> Schema 9 (which also can be described as the "schema for contextualization") may be applied to any objects of thought (e.g., concrete things, events, classes of things and events, ideas, theories, etc.). The schema involves placing these phenomena in the contexts of

---

[23] Ken Wilber's (1995) discourse on holons is one way of pointing to the ever-present embeddedness of everything in larger wholes.

> larger wholes, which may be referred to as *systems, structures, contexts, processes, sets of connections, wholes, forms,* etc.
>
> Schema 9 is a reflection of the assumption that individual elements are organized, or can be organized into larger wholes. Its application can be seen as turning the thinker's attention to these larger wholes....
>
> Schema 9 describes a process of contextualization, and can be related to any verbal expression which indicates that the subject is viewing something within the context of a larger whole. (Basseches, 1984, pp. 107-108, emphasis in the original)

Consequently, a person with a strongly developed context awareness regularly turns attention towards the wider context's patterns of change and structural conditions. The formulation of goals and strategies is continually adapted to what seems possible, what has a good fit with trends in the environment, and what needs to be done in order to skillfully handle the way the context sets conditions for the successful attainment of goals. For the person with a strong context awareness, the wider context is a distinct gestalt in the field of vision. There is an awareness of the complexity of the processes going on and the conditions set by the structural properties of the system(s) one is embedded in. This gestalt is continually updated and perhaps sometimes reevaluated.

A person with a weak context awareness does not actively look for the properties and trends of the wider context. The context is simply not given consideration. Consequently, this person has only vague conceptions of what the structural conditions and change trends of the context could imply for his or her own concerns. Goals and strategies are formulated without being informed by and adapted to the specific conditions of the context. A person with a weak context awareness may be attracted to the formulation of a utopian vision of how things ought to be ordered *because* he or she is unaware of the intricacies of existing inert structures, unpredictable processes, and complex relationships. The person with a strong context awareness is generally more sceptical about being too specific in the formulation of desired outcomes, since there is a deep-rooted awareness of the complexity of the situation. There are too many processes and conditions one cannot control, therefore goals and strategies have to be continually adapted as events unfold.

Context Awareness as a Basis for Identifications

"Context" can be conceived as a nested hierarchy of increasing scope, where what is considered to be task and what is context is always relative to each other. For a person who is strongly focussed on her own immediate work tasks, the team she belongs to is, for her, the immediate context that she might be more or less aware of. For a person who sees as her task to manage a team, the rest of the organization can be considered to be the context, while for the leader of the organization, its efficient operation may be seen as the primary task, and the relevant context is the (changing) environment the organization operates in.

Increasing context awareness often means a reconstruction of tasks, so that what was before considered to be context in relation to a task with a more narrow scope, becomes a focus of attention in its own right and goals relating to influencing the way the larger context operates gain in importance.

In terms of analysing societal change agency, a distinct, elaborated and systemic gestalt of societal conditions, structures, and patterns of long-term change often leads to the formulation of concerns derived from an image of what is going on in the society. It is not enough to successfully solve an intriguing problem or build a successful operation. One also needs to feel that what one engages in stands in the service of the evolving needs of the society.[24]

Action Competences Related to Context Awareness

A strong context awareness imprints itself on action competences by skillful adaptations of strategies to the conditions and patterns of change in the wider context. One example of such action competences is a continual scanning of what is going on in the environment in order to catch upcoming opportunities presented by new, often unforeseen, developments. Another example is the continual adaptation of strategies to restrictions and opportunities presented by the context. The term "room of manoeuvre" points to an awareness of the need to look for openings determined by conditions in the context.

Stakeholder Awareness

Stakeholder awareness concerns the extent to which an individual notices the presence and roles of people, organizations, associations, groups, or other types of actors that might in various ways have a role to play in the initiative the societal change agent engages in. There are three major aspects of stakeholder awareness, as it is conceptualized here: (a) awareness of the existence of relevant stakeholders; (b) constructing more or less differentiated images of the properties of stakeholders, and (c) awareness of properties of *relationships* between oneself and different stakeholders, as well as relationships among different stakeholders.

Persons with a strong stakeholder awareness have something like an "always on" function scanning the environment for significant stakeholders to keep track on. This scanning produces an internal "map" of different types of actors, including images of their respective properties. This map can then be "consulted" in later situations, when various issues come up, in order to identify, for example, people who might contribute ideas or resources, actors who might have objections that ought to be considered, or someone who ought to be informed in advance about a particular course of action. People with a strong stakeholder awareness are attentive to information that might allow them to understand how different stakeholders think, feel, and act. The resulting interpretations are used for adapting one's own style of communi-cation, conversational strategies and actions to fit the particulars of each stakeholder. A strong stakeholder awareness usually means that goals relating to building good relations with specific stakeholders are prominent parts of the societal change agent's strategy.

---

[24] The transformation of the scope of concerns in the course of ego development is beautifully described in Joiner & Josephs, 2007.

Persons with a weak stakeholder awareness simply don't have an internal "map" of stakeholders and the "scanning" for significant stakeholders doesn't get going spontaneously. Images of stakeholders, if at all formed, are undifferentiated and unreflected. People with weak stakeholder awareness act without much prior consideration of stakeholders that might contribute to or stand in the way of initiatives.

It should be noted that an individual can have a strong and differentiated awareness in relation to some groups of people who are at the center of one's conception of significant issues, but devote much less attention to other stakeholders. A person might, for example, want to do something about the situation of unemployed youth in the neighbourhood, who are at risk of developing a criminal lifestyle. This person can have a very differentiated understanding of how young people think and feel about themselves and their situation and may have developed a strong sense of commitment and care in relation to this particular group. But it is also possible that this capacity for role-taking is not put to work in relation to many other actors that might be important to understand and relate constructively with, such as the police, local politicians, administrators in the municipality, shop-owners, etc. In such a case, the awareness demonstrated in relation to the youth is rather a consequence of complexity awareness in relation to the chosen task, rather than stakeholder awareness proper.

Models in the Adult Development Literature that May be Useful

Jordan analysed the structural forms of images of the counterpart in a large number of narratives about workplace conflicts and concluded that the ways the respondents described others could be assigned to three basic categories (Jordan & Lundin, 2002). In the research report, the three categories are called *fixed traits*, *linear psychological causality*, and *complex psychological causality*.[25] Briefly explained, the category *fixed traits* comprises those descriptions of other people that are limited to the enumeration of characterizing adjectives and descriptions of typical behaviour. No efforts are made to understand *why* people behave in certain ways. The category *linear psychological causality* covered the counterpart images that included some ideas about why the other person acted in a particular way, or had a certain attitude. The images of the counterpart classified in the category *complex psychological causality* described the other person in systemic terms, where behavior and attitude was interpreted as an integral consequence of interrelated factors like personality structure, personal biography, life situation, educational background, enculturation, etc. In the terminology in the section on complexity awareness, I would call the first category a declarative image of the other, the second category a linear image, and the third category a systemic image.

Table 3 shows another example of how descriptions of people can be more or less complex in the meaning-making system of an individual. The table describes how increasing stakeholder awareness can lead to qualitatively different, and more complex, constructions of people. From our point of view, this kind of conceptualization is useful in pointing to the *character* of the changes in the complexity of mental representations related to increasing stakeholder awareness.

---

[25] These categories correspond closely to the abstract, formal and systematic levels in the Model of Hierarchical Complexity.

[26] Actually categorizing those mental representations into a finite number of stages is, for our purposes, not necessary.

Table 3. A model of development of how people are described

Moral stage	Description of people
Stage 1	People conceived of as particular persons who do particular things.
Stage 2	People classified into groups according to actions they perform.
Stage 2/3	People understood in terms of a few inner states that are closely tied to behavior.
Stage 3	People understood in terms of fixed personality characteristics, sentiments, roles, or motives.
Stage 4	People seen as complex systems of qualities that vary with circumstances.
Stage 5	People seen as complex systems of qualities and processes in interaction with other complex systems.

Note: Extracted from Table 1 in Dawson and Gabrielian, 2003, pp. 166-167.

Stakeholder Awareness as a Basis for Identifications

A strong stakeholder awareness imprints itself on goal construction by the realization that understanding stakeholders, establishing productive relationships to them, and influencing their views are crucial enabling goals. In order to achieve significant progress regarding visions and problem solutions, it is often necessary to invest a lot of time and creativity in managing the relationships with a network of stakeholders. Stakeholders have different meaning-making systems, including narratives, attitudes, conceptions of causal relations, and levels of awareness. They have their respective knowledge constellations with some areas where they have expert knowledge and other areas where they are ignorant. They also have their own patterns of behaviours that may be more or less conducive to the ends of the societal change agent. All this can be apprehended, interpreted, and influenced.

Strong stakeholder awareness, in particular understanding of the background causes of stakeholders' views and actions, generally reduces the tendency to get stuck in antagonistic conceptions and opens up for empathy even towards stakeholders who oppose own initiatives.

---

[26] There are other theoretical frameworks in the adult development literature that are at least partly relevant to the stakeholder awareness domain. Robert Selman (1980) did some pathbreaking research on the development of how children and adolescents construct relationships. Some of this work is relevant for identifying adults' reasoning about relationships, but more work is needed in order to have a good conceptualization of developmental differences in typical adult meaning-making. Martina Gremmler-Fuhr's doctoral dissertation (Gremmler-Fuhr, 2006) offers a comprehensive typology of different kinds of properties of relationships and discusses these in a developmental perspective. Considerable work would be needed to adapt the typology to the purposes of this study, though. Outside the adult development literature, the discourse around emotional intelligence offers useful concepts, but generally disregard the developmental preconditions and patterns.

Action Competences Related to Stakeholder Awareness

Often, the most apparent consequence of a weak stakeholder awareness is simply the ignoring of possibilities for contacting and establishing productive relationships with potentially significant stakeholders. There are individuals, officials, and organizations that might play an important role in a process to realize a societal change agent initiative, but they remain invisible to the person, at least until they actively block the way forward.

People with a weak stakeholder awareness have little to work with when deciding how to behave in relation to significant stakeholders. They have no clear conception of what the mental world of the other looks like and therefore do not reflect on how their own ways of talking and behaving might be adapted to fit with how the other person thinks and feels. Influencing others' attitudes and decisions becomes a matter of persuading, cajoling, or even threathening, i.e., unidirectional modes of influence.[27]

A strong stakeholder awareness generates a lot of information that can be used for adapting behaviour in interactions with stakeholders. Persons with a strong stakeholder awareness often develop skills in creating mutual trust, in formulating ideas and visions that make sense to other stakeholders because they are aligned with their own interests and ideas, and in inviting stakeholders to genuine dialogues (Joiner & Josephs, 2007).

Self-Awareness

The concept of self-awareness refers here to awareness of the processes going on inside a person. Focus is on the extent to which a person is in conscious contact with cognitive, affective, volitional processes, and sensomotorical reflexes. The concept stresses the process- character of being aware of what is going on in the mind and body, rather than on having constructed a self-image that tells a story about what character traits one has. Self-awareness in this sense is something that an individual can have at his or her disposal to very different degrees. Every human being thinks, feels, wants, and has behavioural reflexes all the time while awake. Indeed, it is usually really hard work when starting a meditation practice to learn to calm down these more or less self-propelling processes in order to reach at least a modest measure of stillness. However, self-awareness means actually *noticing* the nature of the internal processes, i.e., taking them as objects of attention. It is not always the case that someone who is annoyed consciously notices his or her own annoyance. It is even less common that someone who starts to dislike a new colleague at work really notices that a process has started in his own mind in such a distinct way that he can ask the question: what do I do with my own feeling of dislike for my new colleague? Many (perhaps most) people are, with Robert Kegan's words, *subject* to their likes and dislikes and act them out without having made the active choice of going along with the feeling.

Self-awareness is an important category of awareness because a strongly developed self-awareness opens the possibility for actively taking care of one's own reactions and for developing strategies to work on transforming one's own habitual patterns of thinking, feeling, wanting, and behaving. A person with a weak self-awareness will not reflect on the nature of the thoughts, emotions, desires, and impulses generated by the organism (i.e., the self) and will therefore not be in a position to handle these processes intentionally. Strong self-awareness means that the notion of self-awareness becomes a part of the ontological assumptions, which in simpler words mean that the individual knows that there are spontaneous cognitive, emotional, and volitional processes going on all the time and that these processes can influence one's actions in desirable and undesirable ways. When something important is at stake, one knows that it can be useful to keep an eye on these processes and to sometimes intervene to change their course.

---

[27] Joiner & Josephs (2007) explore the developmental aspects of "power styles" from unidirectional to more dialectical strategies for influencing others and aligning intentions.

Of course, the noticing and interpretation of self processes can be more or less elaborated, more or less complex in the senses discussed in the section on complexity awareness. Internal feeling states can be noticed and quickly labelled without further reflection on why the feeling arose or what consequences it could possibly have in the future course of events. At the other end of the complexity spectrum, an individual can see thoughts, feelings, and desires in the wider context of his or her own complex system of meaning-making with a past, a present, and a future. Such a well-developed self-awareness opens possibilities for developing comprehensive and sustained strategies for self-transformation.

Models and Concepts in the Adult Development Literature that Might be Useful

Self-awareness has been an important subject in several of the world's wisdom traditions, in particular, perhaps, in Buddhism and the Vedic tradition. However, the theoretical conceptualization of the development of self-awareness seems to be poorly developed in the adult development literature.[28] The founder of psychosynthesis, Roberto Assagioli, is an exception. He was an early Western pioneer in exploring self-awareness as a capacity to witness internal processes without being absorbed by them (Assagioli, 1965).

I conceptualize self-awareness by the combination of two types of distinctions (Jordan, 2001a): six ego processes and four phases. Self-awareness is framed in terms of awareness of six ego processes.

1. Perceiving: Organizing impressions and images of lifeworld experiences.
2. Emotions, feelings and moods.
3. Thought patterns and interpretations.
4. Opinions, likes and dislikes.
5. Motivation, desires, wishes and intentions.
6. Behavioural patterns and habitual reactions.

Each of these six ego processes can be taken as objects of awareness. I describe the development of self-awareness in relation to the six ego processes in four phases (Jordan, 2001a). In the first phase, the individual is subject to the ego processes, which means that they are not conscious gestalts in awareness. People think and feel, but do not consciously notice and attend to the processes of thinking and feeling. The second phase is when the individual notices what is going on in his or her own interior. The third phase constitutes a deepening of self-awareness by not only noticing that processes are going on, but also evaluating the contents of the processes: What do I think about my having these kinds of thinking patterns? In the fourth phase, the individual starts to develop strategies for actively influencing the ego processes, e.g., having a technique for transforming one's own recurring moods or dysfunctional interpretations.

---

[28] A lot of relevant perspectives have been developed in relation to notions like emotional intelligence and mindfulness, but the conceptualization of the *developmental* aspects is generally weak in these discourses.

Joiner and Josephs (2007, pp. 213-214) describe the development of self-awareness in terms of an increasing capacity to *sustain* the attending to internal processes. According to their stage framework, self-awareness proper starts to develop at the first postconventional ego development stage, the *Catalyst* in their terminology. Before this stage, a person's reactions, thinking and feeling are not consciously noticed as they happen. At best, the individual starts to reflect on past occurrences in terms of what was going on in one's own mind and how those processes influenced the course of events. At the Catalyst stage, however, the individual develops "[t]he ability to step back 'in the moment' and attend directly but very briefly to a current assumption, feeling, or behavior that would otherwise escape your attention... In the next stage, *Co-Creator*, there is "[a] slightly more sustained attention to the flow of your ongoing experience, giving you a more robust capacity for processing painful feelings and for understanding whole frames of reference that may differ from your own." The *Synergist* stage is described as having a "[s]ustained, expanded present-centered attention to your physical presence, including your five senses, thought processes, intuitions, and emotional responses." According to Joiner and Josephs, self-awareness only very gradually becomes an integral, ever-present aspect of how one's consciousness operates.

Self-Awareness as a Basis for Identifications

For the societal change agent, the degree of self-awareness is not the immediate source for the formulation of goals, but may have important consequences for the *relationship* a person has to his or her goals and visions and for the more personal unconscious motivations that may play a role in formulating goals and strategies. A person with a strong self-awareness can be expected to be less likely than someone with a weak self-awareness to be driven by needs for personal status and recognition. The familiarity with the comings and goings of thoughts and feelings also generally lead to a more flexible relationship to seemingly compelling idea systems. Strong self-awareness contributes to a process orientation, less likely to construct fixed goals and vision, more likely to engage in a continuous process of finding situationally adapted ways to serve meaningful purposes. Strong self-awareness can, however, lead to the inclusion of auxiliary goals about developing better self-management skills in the overall strategy.[29]

---

[29] Barrett C. Brown (2011) found that late ego stage change agents often report experiencing themselves as serving or being part of some type of transpersonal entity. This interesting finding is probably highly compatible with the framework presented here, but it would take too much space to elaborate on the connections here.

Action Competences Related to Self-Awareness

In the case studies we have made on value-oriented change agents (Emanuelsson, 2011; Jordan, 2006a; Sander & Jordan, 2009, 2011), it was obvious that skills in handling one's own feelings of dejection, frustration, and anger when encountering resistance or indifference are of central importance for success in change initiatives. Among the most common techniques for skillfully taking care of own reactions in a professional role are conscious venting with carefully selected persons, internal dialogues with oneself about the reasons for the resistance (i.e., using stakeholder awareness as an instrument for self-management) and taking care to have sources of mental and spiritual nourishment that are independent of the course of events in the change project.

Perspective Awareness

The category of perspective awareness covers the propensity to notice the properties of one's own and others' perspectives *as* perspectives.[30] Actively and consciously noticing that people (including oneself) have durable patterns in the way they make sense of things has profound consequences for a person's meaning-making system. A strong perspective awareness means that the individual reflects on the properties of perspectives, realizes that these properties can be different and that they can develop over time, and, most importantly, that the properties of perspectives *cause* people to make sense of events in particular ways. No single way of seeing the world is absolute, but there are many different ways of making sense of one's experiences. I myself would have had a different set of values and opinions if I had grown up embedded in another culture, or if I had made other decisions in my life regarding where to live, what to study, which partner to spend my life with, what workplace to stay with, etc.. Perspective awareness means, in other words, that perspectives are regarded as *variables.*

A strong perspective awareness leads to a more flexible relationship to perspectives overall, both to one's own adopted perspective and the different perspectives of other people.

Perspective awareness is, of course, inextricably related to self-awareness. The aspect of perspective awareness that concerns awareness of the properties of one's own system of meaning-making is certainly a continuation of the forms of awareness described in the section on self-awareness. The propensity to notice the processes going on in one's own mind and body becomes perspective awareness when the individual starts to perceive one’s own patterns of reasoning in a systemic way. Of course, perspective awareness is not limited to awareness of one's own perspective. Nor is it limited to awareness of both one's own perspective and the perspectives of significant stakeholders. A strongly developed perspective awareness becomes part of the individual's ontological assumptions. A person with a strong perspective awareness notices the existence of perspectives, how the meaning attributed to issues is dependent on the properties of the perspectives used for making sense of the issues. One can describe and reflect on the properties of perspectives and consider what happens when an issue is interpreted through the filters of different perspectives. Perspectives can be compared and one can reflect on the relationships between different perspectives, e.g., how the respective properties of perspectives lead to conflict or to development of deeper insight through contrasting points of view.

---

[30] My use of the concept "perspective awareness" has evolved from my efforts to concretize and operationalize Ken Wilber's concept "vision-logic" (see e.g., Wilber, 1995, 1997 and in particular 1999). The two concepts are not synonymous, but I want to acknowledge the original source.

A fully developed perspective awareness presupposes systemic thinking. It can actually be seen as a natural product of the deepening of systems thinking, as formulated by Jake Chapman in the following quote from a listserv post:

> There seem to be at least three stages of 'systems thinking.' The first is when people start to conceptualise the world holistically, they see and are interested in the connections between things and they 'discover' feedback loops (and system dynamics, etc.). The second stage is when they realise that different people conceptualise the system differently; they wake up to pluralism and constructivism and realise that to be an effective leader they have to do more than just understand the system. The third stage is when they realise that the way that they think is conditioned by their level of self awareness and that this is true of others too. They now realise that there is a continuous interplay between understanding the inner and the outer and that they are not separate from 'the system.' (Jake Chapman, in a post to the listserv adultdevel, 29 June, 2009, quoted with permission)

Basseches, referring to the work of William Perry (1968, as cited in Basseches, 1984), offers formulations that well capture the nature of perspective awareness (even though he doesn't use that particular naming). Several of his dialectical thinking schemata are relevant, in particular schemata 11, 13, 23 and 24. The quote below is part of Basseches's explanation of Schema 11, *Assumption of contextual relativism*:

> I consider each of the following ideas to be a component of Perry's notion of relativism.
> 1. Ideas and values are to be understood in the context of larger wholes described as "points of view, interpretations, frames of reference, value systems, and contingencies."
> 2. There exists a plurality of these contexts of knowledge (points of view).
> 3. These larger wholes are to be understood in terms of their "structural properties."
> 4. Such an understanding makes "analysis, comparison, and evaluation" possible.
>
> (Basseches, 1984, pp. 110-111)

Basseches also describes, in particular when discussing Schema 23 (*Criticism of formalism based on the interdependence of form and content*) and 24 (*Multiplication of perspectives as a concreteness-preserving approach to inclusiveness*), more advanced forms of perspective awareness. I find his distinctions very useful, but the formulations require some explanation. Basseches uses a juxtaposition between "formalism" and certain forms of dialectical reasoning for clarifying the essence of the latter. The first step in the explanation is:

> In order to describe Schema 23, I will define "formalism" as the effort to describe relationships and movements of particulars as governed by rules or laws which can be stated at a general or universal level, with no reference to the content of the particulars.... The assumption behind formalism is that general laws and rules (form) govern relationships and movements of particulars (content) which exist separately from the general statements themselves. (Basseches, 1984, pp. 142-143)

Basseches says (I interpret) that one way of making sense of things is to try to find universal patterns, valid over a large number of specific instances, patterns that can be described without reference to particular circumstances. These abstract explanations are seen as the real causes behind the immense variety of empirical reality. Then comes the second step in Basseches's explanation: "The schema for criticism of formalism attacks this framework by viewing form and content (universal and particular) as interdependent" (1984, p. 143).

The dialectical worldview is critical of the contraction of meaning-making that is often (at least when considering social and psychological issues) the result of relying on a single abstract discourse about causality.[31] One alternative to this approach is to refuse to abstract and instead consider all the concrete, unique circumstances that are relevant for a specific event. Basseches points out, however, that with a dialectical worldview, there is an alternative:

> … the multiplication-of-perspectives approach relies on the process of abstraction no less than does the abstract universal approach. In generating and articulating perspectives, it begins by abstracting aspects of an interrelated whole out of that whole... However, the difference between the approaches is that, in the multiplication-of-perspectives approach, the abstractions are used consciously with an acknowledgement of their onesidedness, and their limits are pointed out by the juxtaposition of alternative perspectives... To multiply perspectives on the same whole, therefore, is to expose abstractions as one-sided handles on concrete reality, as opposed to universal self-subsistent realities. (Basseches, 1984, pp. 148-149)

When asked to clarify the meaning of the last sentence quoted above, Basseches writes:

> My intent was to say that abstract formulations of "laws" and other generalities are often presented as descriptions of universal realities, with the expectation that they will simply be accepted as established. By generating multiple ways of describing or representing the same or overlapping set of phenomena, one reveals that each of these formulations is not a description of a reality, but is one way that one or more people have used to "grasp" some aspect of their environment in order to relate to it. How any one group grasps their environment is necessarily related to the group's place in the universe and the needs that they are trying to meet, which may not be identical, and in fact may be in conflict, with the needs of other groups. In that sense these formulations are "one-sided." (Basseches, personal email communication, July 28, .2010, quoted with permission)

Models and Concepts in the Adult Development Literature that Might be Useful

King & Kitchener (1994, 2004) developed a framework that describes development of reflective judgement in terms of seven stages. Their model can be useful for tracing the development of perspective awareness back to its very beginnings. Thinking according to the first three "pre-reflective" stages assumes (without awareness of this assumption *as* an assumption) that there is absolute truth. Certain knowledge exists, even though some people may not have access to it. These are stages with no perspective awareness at all. The following "quasi-reflective" and "reflective" stages increasingly recognize that knowledge is constructed, and is therefore dependent on the specific characteristics of the interpretive process. This realization leads to the conclusion that there can be no absolutely certain knowledge. In the later stages of development of reflective judgement, it becomes natural to reflect on how properties of the methods used for gaining knowledge co-determine the outcome of the efforts. Knowledge is then not a matter of more or less correctly representing reality, but is fundamentally of a constructed nature, inherently dependent on the properties of the discourse it is formulated within. Otto Laske (2009) incorporates King's and Kitchener's model in his own framework, calling it "epistemic position." Attending to the level of awareness a person has to the process aspect of knowing can be elucidating.

---

[31] Wilber (1995), following Jürgen Habermas, names this "monological rationality."

Perspective Awareness as a Basis for Identifications

Perspective awareness means that one's own and others' perspectives are distinct gestalts in awareness. This might have concrete consequences for how the individual constructs goals and visions. People with a strong perspective awareness often regard the properties of particular stakeholders' perspectives as a key factor in causing problems or blocking possible solutions to problems. Influencing the properties of those perspectives are then seen as a key enabling goal to work for. By succeeding in initiating a transformation of certain stakeholders' perspectives, it might become possible to accomplish other goals, such as realizing a vision.

The increased awareness that one's own perspective (a) has many structural properties; (b) that these properties have far-reaching consequences for the way one interprets and forms opinions and commitments; and (c) that one's perspective is an outcome of a formative process involving biographic events, cultural environment, educational history, etc., usually leads to a weakening of the exclusive identification with the perspective. One's own perspective is taken as an object of attention and is therefore no longer subject to the self (Kegan, 1994). The weakening of the embeddedness in a particular perspective also weakens the tendency to fall into a dualistic conception of *us-them* relationships. It is no longer a question of *us*, with the good perspective, prevailing over *them*, with bad perspectives. Rather, it seems more fruitful to regard all perspectives as valuable working material. People with a strong perspective awareness don't perceive people with other perspectives as opponents. They differentiate between the individual and the perspective this individual currently is identified with. Perspectives can potentially be transformed, if handled skillfully.

Two further observations can be made about strong perspective awareness as a basis for identifications:

– It is characteristic that people with a strong perspective awareness also have a strong process orientation. This can lead to the construction of goals that aim at creating propitious conditions for creative processes, for example establishing forums for explorative dialogue, developing methods that support inquiry and creativity, working with climate, values, and norms regarding openness to transformation, etc.

– Strong perspective awareness can also lead to a concern for not getting stuck in a limiting perspective. Goals may also include strategies to challenge unexamined assumptions, expose established "truths," and seek out critical voices.

Action Competences Related to Perspective Awareness

Recognizing the existence of perspectives *as* perspectives can have profound effects on a person's attitudes towards people who think very differently. However, actually putting perspective awareness to work is far more advanced task. I would like to cite a formulation Herb Koplowitz made in two posts to the listserv "adultdevel.”

> I think of a transcript Glenn Mehltretter showed me early in my learning Jaques’s system of a professor describing modernism, postmodernism and existentialism quite eloquently – how they related to each other, their differences and so on. This looked clearly Stratum VI to me. Glenn then pointed out that the professor was not doing any work with those descriptions. He wasn’t exercising judgment about them or solving problems with them. He would not have been able to design a modern or postmodern or existential school system let alone a system that integrated two of these approaches. In fact, his work was never above Str III.
> […]
> So for us, a performance that is a learned response is very different from one crafted on the spot by the interviewee. We want our interviews to capture someone’s working, and we understand work to be the exercise of judgment and discretion while engaged in a task. So the issue is not what you can say about modernism but what you can do with it. The issue is how you use (unconscious and ineffable) judgment to choose and use skills (methods you can use without bringing them to consciousness) and knowledge (facts you can use without bringing them to consciousness) to solve the problem at hand. (Herb Koplowitz, in posts to the listserv adultdevel, 3 July, 2009, quoted with permission)

Brown's research (2011, p. 179) points to a number of "perspective-related practices." One is using the contrast and tension between dissimilar perspectives in order to generate a richer understanding of issues and, in particular, to develop integrative action strategies. A second practice is to facilitate more awareness about the mechanisms that generate particular properties of perspectives, so as to deconstruct the unreflected embeddedness in one perspective by taking the creation process of perspectives as objects of attention. A third practice is to facilitate a more pure witness awareness by letting go of all perspectives.

People with a weak perspective awareness often feel that dialogue is a waste of time. They think it is more efficient to let the best expert make the decisions (not seldom themselves) and focus on action. Exploring different angles towards an issue and asking people with very different perspectives for their views on things is something that makes a lot of sense to those who are strongly aware of the pitfalls of monological rationality.

PART III: USING THE AWARENESS FRAMEWORK

Mental Demands of Societal Change Initiatives

The framework outlined above is designed to be useful for analysing meaning-making and patterns of action in *complex* societal change initiatives. Preliminary evidence from interviews we have made with societal entrepreneurs indicate that initiatives can be very successful even if the leading individuals do not show signs of particularly strongly developed awareness in the five domains described above. In less complex endeavours, traditional entrepreneurial personality traits may carry a long way: strong achievement motivation, perseverance, inventiveness, action orientation, a tendency to quickly rebound from dejection states in the face of failed efforts and try new ideas. However, when the societal change initiatives involve influencing how *other* actors and societal institutions handle wicked issues, the difficulty of the task may require something more than the conventional entrepreneurial spirit.

I hypothesize that the following conditions are relevant as descriptors of societal change initiatives that *do* require strongly developed awareness in one or more of the five awareness types.

- The initiative aims at achieving significant changes in how established institutions operate (or such changes are necessary for realizing visions). Success is possible only if significant changes are made in policies, regulations, decision-making procedures.
- Goals of the initiative include attaining comprehensive transformations of significant stakeholders' perspectives on a complex issue.
- Accomplishment of goals is possible only through continuous active cooperation (rather than single decisions) between stakeholders with conflicting interests, roles and identities and/or profound differences in perspectives and value systems. Other specific impediments to such cooperation can be lack of interest or lack of knowledge on the part of important stakeholders.
- Success is dependent on long-term access to different types of resources controlled by other stakeholders.
- There are deep-rooted value conflicts around the issue, so that any action taken provokes strong reactions among stakeholders with power to disrupt the process.
- The initiative is perceived as a threat by powerful institutions and decision-makers.

This list is, of course, very similar to the list of properties of wicked issues in the beginning of the article. Wicked societal issues are wicked precisely because they are complex in ways that make the task of managing them very difficult. It is when facing critical wicked issues that the role of levels of awareness becomes a key factor to consider.

Uses of the Framework

I expect the framework developed here to be useful for two broad purposes. The first one is to gain a more differentiated *understanding* of how levels of awareness influence patterns of engagement with complex societal issues. I believe that an analysis of the patterns of meaning-making can contribute to a more detailed description of the properties of the ways people construct their narratives about societal issues, of how they identify with values, goals and visions, of the patterns of action they engage in in order to reach meaningful results, and not least how patterns of meaning-making may *explain* identification with goals and patterns of action. This more differentiated understanding of patterns might contribute to more penetrating explanations of successes and failures in societal change agency, not least through analysing the relationship between the complexity of the task people take on and the awareness capacities they put to work. Such analyses can also lead to more differentiated and grounded conceptions of the competences needed for societal change agency.

By developing deeper knowledge in the fields outlined above, the framework may also serve a second purpose, namely to assist in designing more effective types of *scaffolding* for societal change agency. Scaffolding can be methods and techniques that support people to mobilize and direct their attention to various aspects of the initiatives they are engaging, so as to develop more effective strategies. Scaffolding can also take the form of coaching formats and strategies, as well as more structured training in the form of courses and educational programmes focussed on societal change agency/societal entrepreneurship. On a more personal level, the framework might be developed into a tool for self-reflection and self-transformation, not least by more clearly articulating potentials for development of more awareness.

Describing and Explaining Different Patterns of Societal Change Agency

Analysing Meaning-Making: What to Look for and How to Score

When using the framework as a tool for empirical research, analysing interviews with societal change agents is a major application. From a pragmatic point of view, I find it reasonable to use a very simple and openended scale for assessing the awareness pattern demonstrated in an interview transcript. I operate with the three levels of *weak*, *moderate,* and *strong*. Table 4 offers a summary overview of the characteristics of *weak* and *strong* forms of awareness for the five different awareness categories of our framework. Classification as "moderate" is a matter of judgment in relation to the descriptions of the "weak" and "strong" level.

Elaboration is a key quality to look for, in particular *lack* of elaboration. The latter is a conspicuous characteristic of many interviews. We can look in the interviews for occasions when the interviewee is invited to talk about something, but simply fails to elaborate on the circumstances, causes, consequences, and systemic conditions that might be relevant. If this is a consistent pattern, we might suspect a low degree of complexity awareness.

Table 4. Coding criteria for five types of awareness in interview transcripts

Type	Weak	Strong
Complexity awareness	• No or unelaborated reasoning about causes. • Explanations limited to fixed properties of persons, collectives or other entities. • Absence of discussion of context-specific circumstances that ought to be considered. • *Possibly:* voicing of undifferentiated opinions (e.g., condemnations, disparaging comments) about persons, collectives and/or phenomena.	• Elaborated reasoning about complex causes and properties. • Issues are explored in a differentiated way, nuances and variability is noticed. • The conceptual repertoire includes words for systemic properties. • Strong presence of dialectical thought forms, emphasizing context-dependence, change processes and properties of relationships. • Tasks are constructed at different levels of complexity/abstraction, including goals regarding influencing systemic properties.
Context awareness	• Focus on concrete tasks. • No or very unelaborated mention of the wider context in which tasks are embedded. • Goals are not formulated in terms of influencing the workings of the wider context, e.g., institutions, rules, culture.	• Elaborate comments about historical background of present situation and issues. • Elaborate comments about organizational structures, cultural norm and value systems as relevant factors for understanding present issues. • Explanations of the properties of the context(-s). • Mention of trends in the environment, change processes that condition own initiative.
Stakeholder awareness	• Absence of elaborated descriptions and reflections about stakeholders that might play a significant role for the initiative. • Few stakeholders are mentioned. • When stakeholders are mentioned, there is no or very unelaborated reasoning about their patterns of behaviour, concerns, motives, reactions, views, interpretations, etc. • If explanations of actions of a stakeholder is offered, it is limited to attribution of fixed properties.	• Frequent mention of different stakeholders with elaborated comments about their concerns, thinking, interpretations, feelings, patterns of behaviour, etc. • Descriptions of properties of relationships between self and stakeholders and/or between different stakeholders. • Formulates goals regarding establishing good working relationships with stakeholders, with mention of strategies adapted to realistic images of properties of stakeholders.
Self-awareness	• No or few comments about the nature of own processes. When such comments are present, they are declarative (assertions without rationale) and unelaborated. • No or unspecified reference to own learning from experiences. • No reports of active strategies for dealing with own reactions, states of mind, etc.	• Elaborated awareness of and reflections on the character of own processes. • Mention of active strategies for dealing with own reactions, feelings, etc. • Formulation of aspirations regarding development of self-management skills.
Perspective awareness	• Assertions are made without supporting arguments/evidence and without comments about the possibility of erroneous conclusions. • No signs of awareness of the dependence of judgments on the properties of perspectives. • No mention of ambitions to influence the properties of own or others' perspectives.	• Elaborate descriptions of own and/or others' perspectives *as* perspectives. • Comparing of perspectives. • Explanations of the properties of perspectives by referring to biography, position, structures, enculturation, etc. • Using differences or even tensions between perspectives to generate insights. • Formulation of goals in terms of facilitating transformation of own or others' perspectives.

The hard part of analysis work is to spot what is *absent* in the respondent's meaning-making, but could have made positive difference if present. The areas of the "map" that are invisible to or only vaguely apprehended by the individual are unavailable for conscious cognitive processing. These absences, if noticed by the researcher, can be as important explanations for the actions, strategies, and attitudes of a person as those patterns of reasoning that are readily recognizable in the interview transcripts. For example:

– If a societal change agent doesn't turn his or her attention towards the motivation, mindset, interpretations, and reactions of an important stakeholder, he or she will not reflect on alternative approaches to engaging the meaning-making of the stakeholder in order to influence how he or she interprets the societal change agent's ambitions.

– If a societal change agent does not turn his or her attention towards the characteristics of how the societal institutions are structured and operate (systemic awareness), it is unlikely that goals relating to influencing structures and culture in institutions will be central to the initiatives of the social change agent.

13.2 Typology of Fields of Action for a Societal Change Agent

Variations in degrees of awareness can obviously be assumed to result in variations in the way societal change agents construct goals. I use "goals" in a broad sense here, not only referring to ultimate outcomes desired by persons involved in an societal change initiative, but also to "enabling goals." When taking on a more complex problem or vision, it is often necessary to set up goals that are not in themselves what one wants to achieve, but conditions that need to be created in order to make a process leading in the desired direction possible. A typical such goal is to establish a personal relationship with a particular important stakeholder, for example a decision-maker in an organization. The establishment of a certain level of contact, mutual positive regard, and trust in a relationship to this stakeholder may not be an end in itself, but a necessary step that has to be completed before starting to work towards the ultimate goal.

In the preceding sections, I have discussed five different categories of awareness, including implications for the construction of concerns. In Table 5, I summarize types of goals that might be part of a societal change agent’s personal strategy.

Table 5. Inventory of different types of goals

People with strong ...	**... are likely to formulate goals about ...**
complexity awareness ...	- preventing undesired outcomes by early interventions in causative processes. - influencing conditions that nurture early stages of causative processes leading to desired outcomes. - influencing outcomes by attending to causality grounded in system properties. - creating favourable conditions for the start and strength of openended creative processes.
context awareness ...	- influencing certain properties of the context, such as policies, regulations, organizational structures. - exerting influence on ongoing complex processes in the context. - creating forums/processes for learning, problem-solving, creativity, thereby

People with strong ...	... are likely to formulate goals about ...
	creating propitious conditions for development. - building capacity of organization to notice, interpret and adapt to ongoing developments in the context. - building capacity to use new opportunities created by changes in the context.
stakeholder awareness ...	- influencing stakeholders' focus of attention and priorities. - influencing stakeholders' narratives, interpretations of issues. - influencing the image stakeholders' have of oneself. - contributing to increased knowledge, understanding and skills regarding significant subjects. - establishing and developing qualities of relationships between self and stakeholders. - influencing the qualities of relationships among stakeholders, e.g., by setting up opportunities for stakeholders to get to know each other and build trust - engaging in processes that aim at adapting strategies and outcomes to take account of how stakeholders experience the situation.
self-awareness ...	- developing own social and problem-solving skills - nurturing own developmental processes - increasing capacity for real-time awareness
perspective awareness ...	- transformation of perspectives - developing effective strategies/methods for transforming norm and value systems. - using the contrast between perspectives to increase the creativity in strategy development. - faciliting more awareness of the processes generating different perspectives

Conclusion: Some Hypotheses to Explore

In this article, I have outlined a discourse for supporting a differentiated interpretation of the meaning-making structures of societal change agents (and people in similar roles). Reviewing the elements of the discourse (in particular the five types of awareness and the postulated relationships between degree of awareness and identifications and action competences) and reflecting on possible implications of the distinctions made here, we can formulate a number of plausible hypotheses for research on societal change agency that might warrant empirical research, for example the following.

- Different meaning-making structures, in particular in terms of the weakness and strength of different types of awareness, lead to different types of societal change agency, both in terms of goals and in terms of strategies employed.
- Individuals with a weakly developed complexity awareness will formulate and engage in projects that are less complex than individuals with a strong complexity awareness.
- Individuals with weakly developed awareness (in the five types described by the framework) will formulate goals that are few in number, narrow in scope and lack elaboration, whereas individuals with strongly developed awareness will construct a broad range of goals and will mention strategies and tactics for dealing with aspects of task complexity, context, stakeholders, self and perspectives.
- Differences in degrees of awareness along the five types lead to systematical differences in

patterns of societal change action.
- The explanatory value of the societal change agent's degree of awareness for accomplishing successful outcomes is high when the tasks involved are complex and low when the tasks involved are less complex.

Some of these hypotheses will be explored in the context of our ongoing research project.

Toward Post-metaphysical Enactments: On Epistemic Drives, Negative Capability, and Indeterminacy Analysis

Tom Murray[1]

Abstract: Various approaches and interpretations of post-metaphysics are described, followed by an exploration of methods and approaches to enacting a post-metaphysical attitude toward beliefs, and in particular beliefs commonly held within the community of integral theory and practice. Integral Post-metaphysics is described in context with the larger trend of post-metaphysical thought. Along the way several concepts and themes are introduced, including the epistemic turn in reasoning, misplaced concreteness, epistemic drives, and negative capability.

Keywords: Epistemic turn, integral theory, post-metaphysics.

Introduction

A number of scholars referenced in integralist texts, including philosopher Jürgen Habermas and developmentalists Robert Kegan, Michael Basseches, Clare Graves, and Suzanne Cook-Greuter, have pointed to the emergence of, and need for, more sophisticated and reflective approaches to reasoning about complex phenomena.[2] Reflective reasoning here refers to the habit or skill of reasoning about the character and limitations of reasoning itself, including reflecting critically on one's sources of certainty and methods justification. Kegan refers to “fifth order consciousness” and Basseches to “dialectical thinking” in discussing skills sets related to highly reflective thought (Kegan, 1994; Basseches, 1984). It has been suggested by many (including David Bohm, 1980) that current global problems have more to do with limitations in human reasoning processes than natural constraints, and that any deep resolution of these problems will require a different *relationship to* our beliefs (knowledge, thoughts, certainty, mental processes, etc.), transforming these mind-phenomena from unexamined subjective experiences into objects of awareness and reflection.

SOME RIGHTS RESERVED

Habermas' term “post-metaphysical” refers, in part, to this more reflective form of reasoning, which can be seen as emerging in academic circles but also characterizes a (quite nascent) emerging sophistication in informal reasoning in (post-) modern society (Habermas, 1992). Metaphysics traditionally concerns questions about what is real beyond concrete sensory reality, and post-metaphysics refers to a more reflective approach to not only questions of what is real, but also questions of what is true (and how truth can be agreed upon or understood). The integral community has much to offer in the practical and theoretical aspects of this area, due to its explorations into second-tier, integral, post-formal, and/or post-post-modern levels or stages of development (and in supporting the transition from prior levels into these levels).

In recent years, new developments in Ken Wilber's integral theory have focused on ontology, metaphysics, epistemology, and method, i.e., philosophical questions about the nature of knowledge and what is knowable (Wilber, 2006). Wilber's “Wilber-5” theoretical stage, and related work by Sean Esbjörn-Hargens that extends this work, includes integral post-metaphysics (which in turn includes integral methodological pluralism) (Esbjörn-Hargens, 2005; Esbjörn-Hargens & Zimmerman, 2009). Post-metaphysics,[3] concerned with the nature of knowledge, truth, reality, and belief, might seem like an esoteric philosophical topic, but the ideas behind post-metaphysics have strong implications for everyday life practices. Also, post-metaphysical thinking is implicated in embodying “second tier” (or integral stage) development, which is a central developmental marker for integralists.[4]

As I did for the topic of methodological pluralism in a 2010 paper (Murray, 2010a), in this paper I will explore the topic of post-metaphysics in terms of what it might look like to more fully apply and enact it within the community of integral scholars and practitioners (henceforth “integral community,” in which I am a participant), or more generally, within any knowledge building community. I will discuss its meaning and implications from several perspectives, and suggest a number of principles and approaches that can help us take a post-metaphysical stance to our own knowledge creation and belief promotion activities. Though I will refer to the problems in finding rigorous truths in domains such as the human sciences this article does not intended to address empirical researchers, who must aim for as much rigor as their subject matter will allow, but rather is for inter/trans-disciplinarians who are trying to integrate many fields of knowledge in holistic applications.

Second-tier skill development includes a high level of reflective understanding of self, belief, and the human condition. Previously (Murray, 2010a), I used the term “epistemic wisdom” to point specifically to the aspects of second tier skill (especially construct awareness) related to questions of knowledge, belief, and truth; and later (Murray, 2010b), I described second tier skills in terms of four types of “wisdom skills”: ego-awareness, construct-awareness, relational-awareness, and systems-awareness. Taking a (second tier) post-metaphysical stance involves moving further away from black and white, us versus them, and either-or thinking into ever more nuanced, complex, and dynamic perspectives, which Walsh (2009) calls “perspectival range.” It includes moving further from basing beliefs on authority, peer pressure, magical thinking, and emotional or unconscious drives, toward forming beliefs using rational systematic thought, critical thinking, cognitive empathy, a tolerance for paradox and uncertainty, and intuitions grounded in deep ethical sensibilities. It even includes understanding how authority, peer pressure, magical thinking, and emotional and unconscious drives are unavoidable and important aspects of normal belief formation. That is, it tries to see these aspects of thought more objectively for what they are, and use that understanding in forming, defending, or transforming one's beliefs.[5]

---

[3] I will speak to "post metaphysics," more broadly than Integral Post-metaphysics.

[4] Second tier is a term used within the integral community to refer to a level of adult cognitive/emotional/social/spiritual development that is post-formal. Associated terms include vision logic, post-rational, Metasystemic, dialectical thinking, and construct aware.

In a companion paper to this one titled “On the development of beliefs vs. capacities: post-metaphysical implications of second tier skillfulness” (Murray, 2010b) I proposed that developmental narratives within the integral community often conflate the development of *skills* (or capacities) with the development of *beliefs* (including values or worldviews), and that this conflation leads to several problems. I suggested that our approach to describing and promoting human development be more oriented around the skills or capacities that people have than around the ideas (models, theories, principles, facts) that they believe. Much of my argument centered on the problems of unreflectively holding or promoting ideas, models, or belief systems. (Compared with other knowledge-building communities, the integral community does quite well here, but it also has the potential to go much further in practicing what its leading-edge principles imply). In the next section I will broaden this exploration of integralist beliefs from the focus on narratives about human development to include the set of beliefs commonly espoused by integralists (without going into any in detail). At issue is how we can not only create but disseminate and promote these useful beliefs, while still actively taking a reflective distance (or post-metaphysical stance) on them, fully allowing for alternatives, indeterminacies, and unknowing.

Integralists often employ the adages to “not confuse the map with the territory” and avoid the “myth of the given,” but closer inspection shows that enacting these slogans is indeed difficult, and subtle forms of metaphysical thinking and “misplaced concreteness” exist throughout integral discourse. In dealing with disagreements or contradicting knowledge it can be easy to back into a relativistic (or even so-called “non-dual”) stance and claim that the truth is subjective, perspectival, unknowable, or meaningless. This can serve the positive functions of supporting humility, opening to new ideas, or releasing attachment. But, it can also become a cavalier or defeatist move away from a topic or interlocutor to avoid the conflict—missing opportunities that a disagreement may tender. In order to move forward rather than back (when appropriate) and engage more intimately with the topic, the self, and the other, it helps to have specific knowledge and skills implicated by the epistemic wisdom alluded to above. That is, just accepting or succumbing to the indeterminacies of knowledge (and thought) is often not adequate, and understanding how these indeterminacies *work* and how to *manage* them can be beneficial. This paper attempts to make a small contribution in this direction.

In what follows I will explore various meanings of post-metaphysics, anchor the discussion in beliefs commonly held by integralists, and provide a context for post-metaphysics by describing the “epistemic turn” in philosophy and culture. Then I will introduce a number of ideas meant to support a post-metaphysical stance on knowledge creation and dissemination, including

---

[5] As is commonly understood, we transcend, include, and transform the earlier modes, rather than leaving them behind.

"negative capability," "indeterminacy analysis," "epistemic drives," a developmental treatment of misplaced concreteness, and an argument for the validity of "meaning-generative" claims.

Integralists' Beliefs and Metaphysics

As a way to ground the topic of post-metaphysics in everyday life practices, let us look at the beliefs we hold as integralists and ask about our relationship to those beliefs. We integralists often define ourselves by how we differ from the prior cultural developmental level (variously called green meme, New Age, or postmodern). We also live with the challenge of trying to describe and defend our beliefs to friends and colleagues who hold different world views. In Table 1, I list some common integral community ideas (concepts and beliefs) and contrast them with New Age ideas. (In the middle column are beliefs that seem to exist in both categories; some are New Age beliefs that can be held in an integral context.) In that table, I focus on contentious beliefs about what is real or true, though one could list many others less ontologically problematic or "edgy." "Integral beliefs" here includes not only quasi-formal models like AQAL, but also the whole set of beliefs, theories, and principles held causally by integralists. This is a rough caricature and accuracy of this categorization is not important. The point is to help the reader reflect on beliefs that one has that associate one with one's intellectual or social compatriots.[6]

Table 1. New Age vs. Integralist Beliefs

New Age	New Age and Integral	Integral
UFOs and lost ancient advanced civilizations; the healing power of crystals; the earth is a living conscious being (Gaia); we can manifest our wishes through intention alone; astrology, and other prognostication systems and personality typing systems; various schools of mystical and occult beliefs; "all you need is love" (and peace); everything is perfect as it is.	Channeling and the existence of non-physical beings; ESP and psychic phenomena; intuitions can offer sturdy truths and directives; existence of a soul/spirit (and constructs such as Over-soul, Authentic Self), reincarnation and past lives; synchronicity; psychic energy and the chakra system; the reality of collective consciousness and parts of the self such as ego and shadow; all is one.	The universe is evolving – through us; Eros, Agape, involution, morphogenetic fields, Omega Point; the 4 quadrants (or 8 zones) are discrete and ontologically fundamental; cultures and people can be categorized in terms of general developmental levels like Blue, Green, and Turquoise; there is a non-dual ground of being beyond space, time, energy, matter, and mind.

Readers identifying with the integral community have probably had frustrating experiences trying to explain integral ideas to peers or trying to critique New Age beliefs (this notion was born out in a seminar discussion at an integral community event). For the purposes of our post-metaphysical explorations, we can ask: How confident can we be in such discourses? How can we characterize the difference between these two sets of ideas (what differentiates "ours" vs.

---

[6] If you don't identify with the beliefs in that column, just substitute any beliefs, skills, values, or knowledge that you feel developmentally differentiates you from others, along any "line" of development.

"theirs")? Are there particularly integral ways to justify and critique? We will look at the *metaphysical* aspects of such beliefs and then inquire into implications of *post*-metaphysics.

First I will point out that some of the items in the table are centrally about controversial questions about what is real or what exists, while others are statements or principles that make a claim *about* things that are less problematically assumed to exist (while a few are in both categories).[7] For example, contentions about Gaia, flying saucers, ESP, omega point, and morphogenetic fields are largely or firstly about whether such constructs are objectively real. In contrast "healing" and "crystals" are thought to exist without contention, while the claim "crystals have a healing power" is controversial. This rough distinction between existence claims and other types of claims built upon them is not philosophically air-tight by any means, but is made because there are different points I want to make about *concepts vs. statements vs. models/theories* (and because the topic of metaphysical vs. post-metaphysical often hinges around what is considered to exist and how). Concepts are things that exist in some way; statements are claims *about* (and built up using) multiple concepts; and models/theories are more complex ideas built from multiple statements.[8] In a very rough sense, concepts are about what is *real*, statements are about what is *true*, and models/theories are about what is *useful.* (See the Appendix for a diagram illustrating these distinctions).

A main point is that statements and theories/models are built up from concepts, and thus any indeterminacy or assumptions at the level of concepts (the things we point to as definitively existing) will strongly affect the validity of statements and models/theories. Questions about the existence of many of the phenomena listed in Table 1 have metaphysical implications. Metaphysics deals with questions of what is real (vs. not real), and the fundamental nature of, essence of, or first principles behind abstract ideas such as being, substance, cause, time, and space.

Metaphysics is often about objects or phenomena that are said to exist both outside physical reality *and* independently outside the subjective realm of human thought forms.[9] Metaphysical claims, whether made by esteemed philosophers or by your hairdresser cousin, are particularly problematic because of this. We have methods and conventions, including the scientific paradigm, for justifying and testing claims about physical reality. We also have methods and conventions, albeit less rigorous, for justifying and testing claims about subjective realities. But on what basis does one make a metaphysical claim? How could one ever test such a claim when it refers to something beyond both matter and mind? Unexamined personal or cultural metaphysical assumptions about what legitimately exists and does not exist can lead to "repressive metaphysical projections" (Cooke, 1994, p. ix). This problem is what led to so-called post-metaphysical approaches.

---

[7] In Murray (submitted) I explore issues of ontology and what can be considered "real" from a post-metaphysical and "embodied" philosophical perspective.

[8] Also, I will avoid the quagmire of defining what is meant by reality, and simply assume, in alignment with both New Age and integral world views, that interior (human mental) realities have an equal ontological status with external physical realities.

[9] Metaphysics originally meant the body of Aristotle's work *after* his Physics, but later took on its current meaning of the science of things transcending the physical or natural.

Post-Metaphysics

The concept of post-metaphysics figures prominently in recent integral discourse. Integralists have aligned themselves with the post-metaphysical turn in philosophy and a post-metaphysical orientation to truth and knowledge. Integralists follow Wilber in repudiating “confusing the map with the territory” and “the myth of the given.”[10] Wilber describes his latest work (“Wilber-5”) as AQAL plus post-metaphysics.[11] Indeed, it could be argued that the post-metaphysical perspective is at the heart of the evolution of human meaning-making capacity that integral theory points to. Post-metaphysics constitutes a post-post-modern approach to what we think is real or true; i.e., it is about our evolving relationship to *belief* and the *skills* we use to construct and reflect upon beliefs. Below we will look into the concept of post-metaphysics to see how it is understood and then propose some alternative perspectives on its use. As we will see in the quotes below, the construct of post-metaphysics exists as a family of related ideas, with different authors having somewhat different interpretations.

In *Integral Spirituality* Wilber (2006, p. 231) says that “[arguably,] metaphysics…ended with Kant [who realized that] we do not perceive empirical objects in a completely realistic, pregiven fashion; but rather, structures of the knowing subject import various characteristics to the known object…Metaphysics is then a broad name for the type of thinking that can't figure [out that] reality is not a perception, but a conception…thinking that falls prey to the myth of the given.”[12] In terms of philosophy, Wilber says that post-metaphysical approaches avoid “postulating fixed, eternal, [ahistorical,] independently existing archetypes” [or Platonic Forms] (p. 247).

In a transcribed dialog with Wilber, Andrew Cohen says: “Your ideas about a post-metaphysical spirituality have had a powerful impact on me…Specifically, I am endlessly compelled by the notion that higher stages or levels do not preexist, that is, they are not 'given' but are literally created by brave individuals who actually venture into new, uncharted territory…A post-metaphysical worldview means we are not separate from the creative principles or God-impulse itself” (Cohen & Wilber, 2006). This interpretation of post-metaphysics, common in the integral community, replaces the fixed and eternal aspects of metaphysical ideas with an emergent dynamics, but seems to retain some of metaphysics' sense of essentialism and esotericism.

In *Integral Ecology*, Esbjörn-Hargens and Zimmerman (2009, p. 65) draw from Wilber's work and emphasize the multi-perspectival and participatory nature of post-metaphysics, which “avoids positing realities independent of the viewer,” and they note that all claims must be understood as “perspectives from somewhere by someone” (p. 484). They link the post-metaphysical approach to Wilber's four quadrants and eight indigenous perspectives

---

[10] "Myth of the given" was coined by Sellars (1956). The map/territory phrase is attributed to Korzybski (1948).

[11] See Esbjörn-Hargens and Zimmerman (2009, p. 564, note 38).

[12] George Lukas describes "the Kantian understanding of Metaphysics" as "[dealing] with entities about which we can know nothing since they are not given in experience. Metaphysics is said to claim entities, and knowledge of entities such as first cause or God that go to explain what appears to us. The hiddenness of the explanatory entity is, for Kant, sufficient do discount it, except as a topic for thought" (Lucas, 1986, p. 65).

(methodological families), and to his method of Kosmic Addresses, which I describe later. They echo above descriptions of post-metaphysics avoiding preordained and eternal metaphysical constructs (p. 141).

In *Integral Consciousness* McIntosh proposes some problems with the post-metaphysical turn, and says that metaphysics will remain with us.

> In between the hard facts of science and the revealed truths of religion, there are to be found questions about the nature of reality that seek answers within the realm of reason. Metaphysics can thus be understood as philosophy's attempt to discern that which is beyond the external, material ream without resorting to explanations that rely solely on the unquestioned authority of spiritual teachers of sacred texts.” (McIntosh, 2007, p. 205)

He points out that Wilber routinely uses what could be called metaphysical concepts (e.g., involution, Agape, Eros, morphogenetic field; pp. 215-216). McIntosh's point that metaphysical questions and metaphysical thinking will remain with us is important, a topic I take up further below. But he misunderstands the post-metaphysical project (and Habermas' and Wilber's approach to it) as being anti-metaphysical as opposed to post-metaphysical (he assumes that it rejects metaphysical concerns and thinking rather than transcending and including them).

Stein links post-metaphysics to the scientific method and, more fundamentally, to a reflective (or meta-) perspective on not just the contents of our beliefs, but the methods by which we produce and justify knowledge (i.e., “the conditions that allow us to get on with inquiry”) (2008b, p. 20).[13] “Understanding philosophy in this way entails turning away from speculative metaphysics and toward the rigorous analysis and critique of inquiry itself” (p. 2). He claims that “to adopt a properly post-metaphysical approach to development [is to] turn away from the stories describing development and toward the making of the metrics that justify these stories” (2008a, p. 1).

Stein's approach follows closely that of contemporary philosopher Jürgen Habermas, the acknowledged expert on the topic of post-metaphysics. Cooke (1994) summarizes Habermas' notion of post-metaphysical philosophical trends as having: (a) called into question the substantive conceptions of rationality (e.g., “a rational person thinks this”) and put forward procedural or formal conceptions instead (e.g., “a rational person thinks like this”); (b) replaced foundationalism with fallibilism with regard to valid knowledge and how it may be achieved; (c) cast doubt on the idea that reason should be conceived abstractly beyond history and the complexities of social life; and has contextualized or situated reason in actual historical practices (i.e., collaborative action and dialog); and (d) given up philosophy's traditional fixation on theoretical truth, to the extent that they also recognize the moral and expressive functions of language as part of the [reasoning process] [which is thus affected by notions of rightness, sincerity, and authenticity].

---

[13] Stein (2008a) credits Pierce as a founder of the post-metaphysical approach: "by relinquishing philosophy's claim to a unique privileged mode of insight, Peirce...recast philosophy in terms of the same fallibilistic self-understanding that characterizes scientific endeavors" (p. 2).

The post-metaphysical turn in philosophy and culture can be understood as a product of an "epistemic turn" of increasing human understanding of the role of human thought processes in the production of knowledge and belief.[14] This trend, which I discuss in the next section, began with Kant, blossomed with the American pragmatists, then deepened with the advent of modern cognitive and social sciences.[15]

The Epistemic Turn as a Deeper Understanding of the Mind

The last 500 years of human history from the Renaissance through the scientific and industrial revolutions can be viewed in terms of humanity's accelerating understanding, and partial mastery, of the *physical world*. Both the accomplishments and the calamities of this period, marked by increasingly sophisticated use of the rational mind to penetrate the truths of the physical world, have been established at length by scholars and pundits.

In the last one to two hundred years another type of understanding has emerged: an *understanding of the mind*, including advances in psychology, consciousness studies, language, culture, meaning, cognition, and neuroscience. This "epistemic turn" (which includes the linguistic turn in philosophy) embraces an evolving acknowledgment that human flourishing is mind-bound in several senses. First, the human happiness or satisfaction that is the ultimate goal of rational problem solving and efforts to control the physical world is itself a mental state that depends on much more than external realities. That is, "happiness is all in our heads," at least after basic physical needs are met, and creating happiness is very much about understanding the mind (as Buddhists have always said). Second, most if not all of the major problems facing humanity are problems ("crises") in rationality, imagination, education, and/or compassion, not hard limitations put up by the physical world. They have been caused more by human thought, including short sightedness, greed, ignorance, and the "negative emotions," than by "natural causes."[16] Third, the primary source of techno-scientific advancement, the rational mind, is seen to be seriously flawed or limited. From a post-rational perspective, we can see that logic has limited scope, rational thought is systematically distorted, and that the constructs and models that form the building blocks of language and theories are unsettlingly indeterminate and fallible (Gilbert, 2006; Gilovish, 1991; Kahneman et al. 1982). Again, a deeper understanding of the workings of the human mind is called for.

---

[14] In Murray (2006, 2010a) I quote Bohm and Einstein in support of the idea that contemporary global mega-issues can be traced to a general lack of understanding of how the human mind works, individually and collectively. We can see in Walsh's (2009) analysis of common factors of the great wisdom traditions that, even though "know thyself" is implied and contemplative traditions focus on awareness of thought, the wisdom traditions had little to say in the way of what we are calling epistemic wisdom. We can posit that the complexity of thought and culture has reached a level that an epistemic turn is greatly needed.

[15] The post-metaphysical turn is closely related to the philosophy of pragmatism, which has strongly influenced Wilber and integral theory (through scholars including James, Whitehead, and Habermas). Louis Menand described pragmatism as *an idea about ideas*: "The idea is that ideas—theories, beliefs, convictions, principles, concepts, hypotheses—are essentially means of adaptation…Ideas are not "out there" waiting to be discovered, but are tools that people devise" (2004, p. 1, 8).

[16] Of course, the current developmental state of humanity is simply what it has become, and thus in one sense is a product of the natural world.

George Lakoff warns that “what we take truth to be is...a matter for cognitive science because it depends on the nature of human understanding” (Lakoff & Johnson 1999, p. 108).[17] Thus, a central element of this epistemic (or post-metaphysical) turn is to understand mind in its individual and collective manifestations, which, like nature in the prior period, can be seen to hold both the shackles to and the means of liberation from humanity's current predicaments. This injunction is constructive for both scholars investigating the limits of knowledge, and to everyday practitioners whose more casual, yet still highly reflective, understanding of how the mind works impacts their communicative and learning processes.

The emerging understanding of mind has many branches. Scholars are coming to understand the nature of ego, identity, motivational drives, adult cognitive development, and the unconscious (including shadow); the nature of group dynamics and cultural development; and the nature of concepts and reasoning itself. It is this last set that is central to epistemic wisdom and the post-metaphysical turn.

Research and theory on human cognitive development has provided deep insights into epistemic questions about the nature of belief and knowledge. Wilber's integral post-metaphysics uses these theories to clarify questions about what seems true or real for different observers.

Integral Post-Metaphysics

Wilber's integral post-metaphysics (Wilber 2006; Esbjörn-Hargens & Zimmerman, 2009) proposes an elegant framework for addressing many perennial ontological, metaphysical, and epistemological conundrums about what is true or real. It follows from Schumacher's (and, earlier, Plotinus') notion of *adequatio* which says that “the understanding of the knower must be adequate to the thing to be known” (Schumacher, 1977, p. 39). That is, what we perceive as real or true is determined in part by our perceptual and cognitive apparatus, and thus both our developmental level (along all of the numerous lines relevant to any situation) and the perspective we are taking. It shifts the blunt question of *whether* objects (e.g., Santa Claus, past lives, Agape, morphogenetic fields) exist, to *in what way* do they exist *for whom*?

Integral post-metaphysics includes a model for representing what Wilber calls the “Kosmic Address” of a claim, which includes the AQAL-based developmental altitude and perspectival quadrant of both the perceiver (claimant) and the object of perception (plus additional parameters if more precision is needed). For example, Santa Claus can be said to “exist,” to be real, for those within a circle of 5 year old believers having a conversation about him. “What kind of cookies does Santa Claus like best?” is a valid question in such a circle. Santa Claus can also exist for *us* if we take the magical-thought perspective of that developmental level, which remains ever-available within our consciousness (some would call it suspension of disbelief). One might say “but Santa Claus doesn't *really* exist at all.” But someone living 1000 years from now may see concepts such as “gravity,” “the flu,” “consciousness,” and “spirit” to be as naïvely insubstantial and imaginary as Santa Claus seems to us, yet contemporary adults treat these constructs as very real indeed. This illustrates the perspectival nature of all claims about truth and reality. We must assume that an objective reality exists beyond the self (to do otherwise is absurd), but any particular claim about that reality must be made by a person (or people) and is thus fallible and perspectival.

---

[17] In Murray (submitted) include an in-depth exploration of Lakoff & Johnson's Embodied Realism.

Esbjörn-Hargens and Zimmerman give the example of "ecosystem." An ecosystem can exist, and claims about one can be made, only for those who have an adequate understanding of the concept, which in itself requires the capacity to think at a certain level of complexity (one that can understand how phenomena and wholes emerge from the chaotic and extremely complex interdependencies of a large number of parts). Another example is the construct "legal system of common law." For those who, due to inexperience or insufficient developmental capacity, have not built up and worked with the concept of one, it cannot exist.

These are questions about the adequatio of the *who* of a claim. In terms of the *how* of a claim, i.e., methodology (and the types of *what* enacted by different methods) we can turn to Wilber, Habermas, and others who explain how different methods give access to different types of knowledge (e.g.,: *look* through this telescope at…; *imagine* a body traveling faster than light…). In particular subjective, objective, and intersubjective truths or knowledge are discovered and argued for differently.[18] For example a community of practitioners who have practiced a certain contemplative method are in a position to dialog about the causes and nature of what they experience. Those who have not enacted this practice or spoken deeply with those who have are in less of a position to engage in the conversation. To give a blunt example, we give little credence to someone pontificating about romantic love when we believe that they have a minimal or distorted experiences of romantic love.

Enacting Post-Metaphysics

Up to now I have been attempting to tie together what others have said about post-metaphysics, epistemology, and the mind. In succeeding sections I will introduce the ideas of "negative capability," "indeterminacy analysis," "epistemic drives," a developmental treatment of misplaced concreteness, in an attempt to offer some new perspectives and principles that may help us take a more post-metaphysical stance on our knowledge creation and dissemination work.

Integral Post-Metaphysics and Positive vs. Negative Capability

Integral post-metaphysics is a powerful framework. Yet its full potential remains to be seen (especially outside the integral community) in part because it is not yet apparent whether the concept of Kosmic Address is sufficiently determinate. In contentious dialogs about the validity of specific claims, will participants be able to agree on the parameters of the Kosmic Address itself? How contentious will the specification of the developmental levels or formal perspective of interlocutors become?[19] In general this illustrates the *positivistic* style of Wilber and AQAL-centered approaches—they provide high level models and concepts enabling more reasoning power, and thus may increase clarity and confidence of beliefs. This contrasts with approaches that expose indeterminacy (uncertainty, fallibility, paradox, dissonance) in human beliefs. The evolving understanding of mind and thought that enabled the "post-metaphysical turn" reveals ever higher layers of positive knowledge (increasing abstraction and nuance thought reflection, differentiation and integration), but *also* reveals ever deeper unsettling territories of unknowing and fallibility that call for the "*negative* capability" of being able to tolerate and work within this indeterminacy (in Murray, 2006, I elaborate on this concept, first coined by the poet John Keats; see also a treatment on "Dark Knowledge"—what we don't know that we don't know— by Fischer & Stein, 2008). This territory is acknowledged by Wilber but not much explored or highlighted in his work.

---

[18] The details of Habermas' Theory of Communicative Action and the eight primordial methodologies of Wilber's integral methodological pluralism are beyond our scope here (see Habermas, 1981; and Wilber, 2008).

[19] The strategy of concluding that another person is developmentally not up to snuff and accepting that they simply don't have the capacity to engage with our beliefs or engage at the level of discourse we hope

For Wilber, post-metaphysics is a method for avoiding the errors of metaphysical (and magical) thinking, mostly through an analysis of different categories of truths or claims (based on categories of the who, what, and how of a claim). My approach is to add to this a perspective on post-metaphysics that is about acknowledging what is unknown, fallible, or uncertain about *any* claim, and to base this on what we know about human thought processes.

Integral post-metaphysics includes Wilber's "three strands of good knowledge" which frame the justification of claims in terms of *injunctions* (*if you do X then you will see or conclude Y*) and *social deliberation*, (*a group of the adequate has followed the injunction and agreed upon the conclusion)*. This framing, again, has a positivist slant in the following sense. For the critical question of "What if people carry out the method but come away with different beliefs?" If we want to move more deeply than the stop-gap conclusions that "investigators disagree, the question remains open," into understanding why others came to different conclusions, integral post-metaphysics would seem to steer us toward the conclusion that others must not all have followed the injunction accurately; or must not all be operating from an adequate developmental level or perspective. Potentially useful answers, but not particularly applicable to many real, contentious questions. The question of how we account for the inherent indeterminacy and variation of concepts, perceptions, worldviews, etc., yet still "get on with it," is not fully addressed. Wilber's three strands model for knowledge validation allows for, but does not include, the following important knowledge validation questions which are more acknowledging of indeterminacy and fallibility, and the calling for negative capability (and reflect the approach of the Habermasian school):[20]

---

for is, though sometimes perfectly valid, also problematic. In doing so we (a) risk misdiagnosing the other using a simplistic categorization system; (b) miss an opportunity to connect more deeply with both the person and the ideas in front of us, and (c) miss an opportunity to more seriously reflect on our beliefs and selves in the face of an authentic encounter with another (and see Kögler, 1992). Admitting that I, and all of us, unavoidably constantly make these sorts of calls to judge the "adequatio" of the listener and gauge how deeply we will engage, we want to take seriously the question of how integral beliefs are explained and argued for in rational public discourse.

[20] Similarly, Mark Edwards (2000) critiques Wilber's three strands model, claiming that it is missing a strand of "interpretation" between steps 2 and 3 that is needed. Others, including Hampson (2007) make the broader argument that Wilber's theories too quickly "transcend and include" key insights and principles from post-modernism, and do not deeply enough acknowledge the fallibility of knowledge into the theory-building.

- What are my/our biases, assumptions, motivations, and incentives (i.e., “systematic distortions” of thought)?
- How far are we removed from experiential data along the Ladder of Inference (see below)?
- How indeterminate (fuzzy, ambiguous) are the fundamental concepts?
- What are the known alternatives, limitations, and fallibilities of this idea?
- What other parties/perspectives should be invited into the inquiry?[21]

Enacting the injunctions to ask the above questions requires the development of both knowledge and skill: knowledge of certain aspects of how one's mind works, and the skills of negative capability that come with practice in applying this knowledge.

In the rest of this section I will outline several post-metaphysical epistemic principles or approaches to belief-holding that address negative capability. These form a preliminary and incomplete set of answers to the question “What would a post-metaphysical or second tier approach to belief-holding look like?” In one sense to even propose concrete ways to deal with indeterminacy and fallibility is a more of a positivist “problem solving” than a negative “opening to the unknown,” but we will let this paradox be.[22] As described above from Habermas, post-metaphysics is a term pointing to a set of related positions that are in a corrective relation to certain historically prior dominant modes of thought. But, as the term implies, at its core it is corrective toward “metaphysical” modes. As we will see below, metaphysical thinking is like a type of magical thinking but at a higher developmental octave. Metaphysical and magical thinking are essentially about how we attribute aspects of physical reality to ideas; concrete ideas in the case of magical thought, and abstract ideas in the case of metaphysical thinking. Because the nature of abstract concepts is a common theme to several principles in post-metaphysics, I take some time to elaborate on this topic next.

The Indeterminate Nature of Concepts

As has been mentioned, statements, models, and theories are built up from basic conceptual building blocks (see the Appendix). Concepts, for our purposes here, are the categories we explicitly use to differentiate things–for example: “chair,” “democracy,” “god,” “red,” and “love” (almost every word or phrase we use points to a conceptual category). A concept can be characterized through two interdependent aspects: its definition and its exemplars. The definition is any general or abstract description, such as a tree being “a woody perennial plant.”[23]

---

[21] Of course, to avoid the postmodern trap, we also must attend to the meta-question of: How urgent and important is the decision and how much effort should be expended before we end the inquiry process (for now) and act upon our (ever fallible) conclusions?

[22] It is like the paradox that fully "letting go" takes a kind of effort and commitment; or the paradox that achieving "beginners mind" requires a kind of sophistication. Epistemic wisdom includes an understanding that such paradoxes point to characteristics of language and thought, not to deep puzzles about reality (some such paradoxes are resolved with a "pre/trans" analysis).

[23] Abstract concept definitions are often thought of as having necessary and/or sufficient conditions, but our intention is to include more informal definitions as well.

Exemplars are individual examples of the things that are contained in the category.[24] Both aspects are important to consider. Exemplars must be given to help ground abstract concepts; and general definitions must be given because it is impossible to list every example. But there are often problems in alignment between definitions and examples. For example, a group engaged in deliberation about “scarce resources” or “indigenous people” or “concealed weapons” may at first seem to be in agreement about the wording of definitions, conclusions, or policy. But further discussions about concrete implementation may reveal great disparity in the things participants consider to be valid examples—they may “draw the line” in very different ways. One person's “scarce resource” or “concealed weapon” is not another's.

Researchers have shown how the nature of concepts differs from what we normally assume about them (Lakoff & Johnson, 1999; Mervis & Rosch, 1981). We often treat conceptual categories as if they were well-defined boxes that things either fall within or outside of. But this is almost never the case. Concepts as psychological phenomena are “graded,” meaning they have fuzzy boundaries such that (a) we can always think of things that are in the fuzzy gray area between being X and not-X; and (b) the meaning associated with a concept varies within each individual or group because they rely on different (usually implicit) exemplars.[25]

Due to the indeterminate nature of concepts, when we say “X is Y” it would be more useful to interpret it as in “any X is Y to the extent that X falls near the central meaning of X” (X is marginally or contingently Y for X's near the boundary of the central meaning of X). We can ameliorate this indeterminacy by trying to be as specific as possible about definitions and exemplars, to minimize the fuzzy gray areas, which is a necessary positivistic strategy, but we must not lose sight of the inevitable indeterminacy in any concept, which calls for an ongoing humility and openness (i.e., negative capability). Interlocutors who disagree about claims—for for example, “democracy supports economic growth” or “blue meme cultures rely on authorities to validate beliefs”—often erroneously assume they have the same meanings or exemplars for the concepts, and thus waste effort arguing about the statement per se rather than clarifying the non-overlap in concept meaning.

Issues with Abstract Concepts and Statements.

Lakoff’s work on conceptual structures indicates that the indeterminacy of concepts becomes progressively worse the more abstract they are, i.e., the further removed from concrete sensory experience and exemplars. Here are examples of sequences of concepts of increasing abstraction (these are from Dawson & Wilson's, 2004, and Dawson & Gabrielian, S., 2003).[26]

---

[24] To clearly specify or teach the boundaries of a conceptual category it is most useful to give central exemplars, clear non-exemplars, and also positive and negative exemplars near the boundary (Tennyson, 1980).

[25] In addition, Lakatos' (1976) investigation of the knowledge building processes illustrates the dynamic interplay between abstract definitions and the examples we consider important; each of which evolves continuously through inquiry. Therefore, in any area where there is active inquiry, such as in science or the law, meanings evolve continuously.

[26] Dawson's research shows that the probability of observing higher indexed concepts increases notably with age and developmental level (as measured here in a task involving thinking about knowledge and other epistemological themes). Dawson & Wilson give these as examples of increasing "hierarchical

1. boys, camping, puppies, school, friend
2. know, guess, think, learn, question
3. believe, certain, trust, imagine, possible
4. actual, accuracy, certainty, plausible, justify
5. cognizant, rationality, skepticism, plausibility, materiality

Concepts at each level of abstraction can be shown to be (in their typical use) built up from (they coordinate, organize, and/or transform) concepts at lower levels of abstraction. Concrete level concepts relate to sensory experiences. Abstract concepts are ideas *about* concrete concepts, and more highly abstract concepts are ideas about ideas (about ideas, about ideas, etc.) about concrete concepts. The natural world of physical reality (the AQAL right hand side) has certain characteristics that make it amenable to scientific study and repeatable, reliable conclusions. It is *relatively* stable and consistent in its lawfulness. The world of *ideas*, in contrast, is more ephemeral (the world of ideas covers much of, but not all of AQAL's left hand side). A claim about the healing power of crystals is fairly concrete. There is a fair chance that, with appropriate resources, it can be tested in a fashion agreeable to many stakeholder perspectives. But with ideas about more abstract concepts such as spirit, omega points, holons, collective consciousness, or non-duality, how do we account for the indeterminacies in our arguments? How can we claim anything with certainty?

Moving from concepts to statements, this is related to Argyris' (1958) "ladder of Inference" description of belief formation.[27] We select *data* from our raw sensory observations, add personal and cultural *meaning* to that data, make *assumptions* based on those meanings, draw *conclusions* based on those assumptions, adopt *beliefs* about the world from the conclusions (these beliefs then effect both our actions and our selection of data in the first place). Argyris says "*the likelihood of differences in the interpretations of different observers increases the higher one goes on the ladder of inference*" (my emphasis).[28] More abstract concepts are less likely to be automatically accepted by out-group, and special care is needed in establishing mutual understanding with out group when in-group is disseminating its valued beliefs.

To summarize the above treatment of abstract concepts: (a) both definitions and exemplars play a role in how concepts are understood, and interlocutors may agree on one of these while diverging on the other; (b) we can differentiate between the "espoused" intellectual understanding of a concept (in terms of definitions or exemplars) vs. its tacit or unconscious manifestation which determines how it is enacted; (c) abstract concepts have graded boundaries; (d) statements made with abstract concepts therefore have a graded validity or truthfulness; (e)

---

order of abstraction." They do *not* make claims (to my knowledge), as Lakoff does, about the metaphorical nature abstract concepts and the problems with increasingly abstract concepts I mention here.

[27] See the Appendix for more on addressing indeterminacy in Concepts vs. Statements.

[28] Argyris continues with "Hence some cardinal rules of action science are: Begin at the lowest rung of the ladder of inference, state the meanings at the next higher rung and check for agreement, and continue to the next higher rung only if there is agreement at lower rungs. These rules are meant not only for action scientists but also for agents in everyday life whenever they are dealing with important and threatening issues" (Argyris, 1985, p. 58). Along similar lines Senge (1990) instructs us to recognize "leaps of abstraction" in our and others' mental models (p. 186).

more highly abstract concepts and statements are more susceptible to these communicative and epistemic indeterminacies.

An Indeterminacy Analysis of Some Integral Theory Constructs

We can apply the above principles to integral theory through an “indeterminacy analysis” (Murray, 2010a), which makes explicit how the fallibility of constructs impacts generalizations made about them. The principle that anything we treat as a rigid category is really more like a graded spectrum is easy to understand with concepts like “third-world country” where the category is clearly not intrinsic to the object but is an abstract property that is assigned. “Third-world country” is (but decreasingly so) clearly a useful though fallible conceptual tool that works well for some countries that fall within its central meaning, and becomes problematic for case at the boundary (such problems, in addition to social justice concerns, have led to new terms such as “emerging” or “developing” countries). But consider how the more foundational categories “subjective vs. objective” and “singular vs. plural” are often treated as distinct categories (the AQAL left hand side vs. right and upper vs. lower quadrants), as if nothing falls in the gray area between them and nothing falls outside each pair of opposites. As *ideas* they can certainly be defined as distinct, but in *practice* (and in cognition) the objects and phenomena of reality do not pre-exist in definite categories.

For example, unconscious mental processes are not exactly subjective, but are they objective? It seems to me that the category fails to be useful here.[29] As to the category singular vs. plural, we can find or imagine things that are sort of singular but also sort of plural, for example a county (set of towns within a state) which does not have a strong central county government (here there is only a partial or incomplete “dominant monad”). The problem with primarily positivistic approaches that are not balanced with negative capability is that phenomena that don't fit the normative definitions of key concepts become marginalized. They will seem to be merely outliers, special cases that are easily and rightly ignored.[30]

We can also apply indeterminacy analysis to the integral theory concept of holon. The four quadrant model and Wilber's twenty tenets (Wilber, 1997) are essentially about the nature of holons. Interpreters of the theory have raised questions about what counts as a holon. Wilber addressed these in a positivistic way by clarifying the difference between holons and heaps, and later as other counter-examples were discovered, clarifying that artifacts are not holons. This process of clarification can and should continue (perhaps indefinitely, as pointed out by Lakatos,

---

[29] An individual who feels as if unconscious processes *must* fall into one category or other will find a way to interpret the concepts so that everything seems to fit tidily, but in doing so may deny some important aspects or exemplars (the dross left when the conceptual knife makes its cut).

[30] A number of alternatives have been proposed to address limitations in the four-quadrant model. Edwards (2002) addresses the fact that "second person" "we" in the "I vs. we" categorization does not adequately capture important differences between the *you* to whom I am speaking and the *we* that transcends and includes you and I (and others). He proposes an alternative to Wilber's 4 quadrants that has six-categories (a singular and plural of 1st, 2nd and 3rd person). But this and most other alternative models also use rigid categories without fully acknowledging the indeterminacies of such categories. A more flexible scheme is seen in Roy's (2006) Process Model which treats the categories of singular/plural and whole/part as potentially overlapping aspects of any phenomena.

1976), but what is also needed is an acknowledgement, including examples, that some objects of interest may fall into a gray area between heaps and holons, or between holons and artifacts, and that AQAL-based conclusions for these objects will be less definite.[31] Other central concepts within integral theory that have significant indeterminacy include “the true, the good, and the beautiful,” I/we/it, gross/subtle/causal, and state/stage treatments.[32] [33]

Issues with abstract concepts arise with Wilber's three strands method as well. He acknowledges but does not dwell on the fact that between the steps of an injunction (look this way) and the social agreement (many with adequate cognition see the same thing) is a step of *interpretation*. Interpretive differences do not go away simply by constraining participants to operate from and point to the same Kosmic Address (even assuming this was possible and desirable). This is less problematic (but not unproblematic) in areas where the exemplars are experiential. The examples that Wilber gives include looking through microscopes and telescopes and using meditative practices. We gain direct experience through such practices and can (a) give clear injunctions to others on how to access those experiences; and (b) have some clarity about what we are pointing to as we engage in intersubjective processes (dialog) to give meaning to those experiences. Wilber makes the critical point that the same sort of reasoning process (i.e., the three strands) that is used for scientific conclusions based on sense data (“the eye of the body”) can be used to make valid conclusions in the realm of pure ideas (“the eye of the mind”) and in the spiritual realm (“the eye of spirit”) (Wilber, 1997). This point provides an important launch pad for rigorous inquiry into realms ignored and devalued in the Western scientistic paradigm, but we must not mislead ourselves into thinking that conclusions based on the datum of ideas or intuitions will have the same character as that based on physical realities and sense experiences. Cognitive science has illustrated that such ideas have significant indeterminacy.

Bracketing aside the realm of mathematics and logic,[34] conclusions grounded in ideas about ideas (the eye of the mind) will be more problematic, more indeterminate, than those grounded in the senses. And what can be said of “the eye of spirit?” Contemplative practices yield direct experiences and insightful ideas—but what third type of data would constitute spiritual data? In my experience there *is* a certain character to what we might call spiritual insights—a kind of deep and quiet certainty. But once that experience is translated into the realm of words and shared ideas it falls prey to all the usual forms of indeterminacy that post-metaphysics recognizes. How are we to treat these insights as valuable while not being constrained by modernist rational modes of justification, yet not fall prey to metaphysical thought? I return to this question in the section on “meaning generative claims” but next I will continue our exploration of the nature of abstract concepts.

---

[31] It may be too much to expect the creators of exceptional theories to do a thorough indeterminacy analysis—they are too close (if they were not they may not have had the focused insight and perseverance to birth the theory in the first place). That is the job of the knowledge-building and practice community as a whole.

[32] Truth, goodness, and beauty are highly useful and meaning-generative concepts. But they are also highly abstract. This does not mean we should avoid making claims using them, but it does call for a non-positivistic approach to making claims using them.

[33] The phenomena of human states, even if we limit it to those aspects relevant to development, epistemology, and spiritual growth, is much more complex than can be captured in the "gross/subtle/causal" or "waking/dreaming/deep sleep" classification. The paucity of this vocabulary limits our ability to inquire. Also, the difficulties in teasing apart state-relevant and stage-relevant phenomena point to a possible need to revisit whether this dichotomy is overused and an alternative is needed.

[34] Which some argue are essentially tautologies, and are at least special cases not relevant to the claims in integral theories.

Misplaced Concreteness through Developmental Levels

Underlying the “myth of the given” and the “map/territory confusion” is a cognitive phenomena that Whitehead (1929) called “misplaced concreteness,” wherein one treats an abstract concept as if it had physical reality (or a reality outside of human interiors). Philosophers and cognitive psychologists arguing from the “embodied mind” perspective note that misplaced concreteness (and related phenomena) are an unavoidable consequence of the fact that the development of the human mind has its foundation in concrete physical interactions and needs (in Murray (submitted) I explore this idea from two directions: genetic/evolutionary and individual cognitive development. There seems to be something deep and strong within us that wants to treat abstract concepts (e.g., democracy, African-American, god, ego, compassion, spirit, evolution, formal operational thinking, left hand quadrant, green meme, or Eros) as if they somehow really existed in the way that we perceive them, or that they represent a-priori nature-determined categories. We “reify” them (or at an extreme, some would say commit an *idolatry of ideas*) that do not so much exist “out there” as they are tools we invented to make meaning of reality. And as mentioned, there is also the strong tendency to treat the boundaries defined by concepts and models as fixed or concrete, and ignore their fuzziness, malleability, ephemerality, and indeterminacy.[35] The deeply metaphorical nature of thought causes us to imbue abstract ideas with traces of the properties of concrete objects (Lakoff & Johnson, 1999).

We can take a developmental perspective on misplaced concreteness (I am not aware of others having done this; but see Ross, 2008 for a developmental analysis of communications based on Hierarchical Complexity). Misplaced concreteness (and its repudiation) begins at more concrete levels and persists through ever more abstract constructs. In magical, concrete operational, and early pre-conventional modes of thought there is insufficient differentiation between imagined and perceived events. The monster under the bed and the mermaid said to live in the pond are very real. With mythic and early conventional forms of thought we differentiate personal imagination from reality but the beliefs given to us by culture are (still) taken as inherent aspects of reality. We believe the “stories” and myths given to us by authorities and peers. My team *is* the best, my country the strongest, my holy text contains the truth. Moving into late-conventional and modernist/rationalist forms of thought we enact the types of misplaced concreteness Whitehead was referring to, and give *abstractions* the gloss of concrete reality. We take our maps and models too seriously (treating them as “the territory”), and tacitly expect reality to conform to them as if these models and equations were properties of matter rather than tools invented by minds. At each succeeding level the limitations of the prior level are seen and transcended, but new forms of misplaced concreteness or reification await us. At each level it is the newly developed capacity (rules at Blue; models at Orange; systems at Green) that seem overly “real.” It should also be noted that all prior forms of thinking and misplaced concreteness remain active, though we develop habits to avoid or compensate them (e.g., “knock on wood,” or “the weather is out to get me today”).

---

[35] Whitehead warned against misplaced concreteness but did not, to my knowledge, discuss its psychological source or natural persistence.

How this phenomenon continues into second tier is less explored. At construct aware or vision logic we more fully understand that the map is not the territory, that our theories are fallible approximations, and that we are perceiving the world through a thick worldview bubble. But we still maintain habits of language use and enaction that treat abstract categories such as subject/object, singular/plural, and state/stage with fixed and well-defined boundaries. At first the realizations of the indeterminacy and fallibility of ideas is unsettling and overwhelming (the post-modern or relativist position), but with deeper understanding and development we eventually understand such phenomena not as unsophisticated or faulty thought modes to be outgrown, but as inevitable dimensions of thought that must be accounted for and, when appropriate, compensated for or neutralized to the extent that we can. We can allow for the meaning-generative power of cultural myths, magical thinking, metaphysical entities, and elegant model while maintaining objective clarity of these beliefs as useful tools for certain purposes. We can flexibly assume perspectives that reveal the valid “reality” of a wide range of cultural world views, personal beliefs, and developmental thinking modalities. We begin to be able to observe concreteness-producing and certainty-producing mental processes as they arise within us.[36]

Epistemic Drives

Misplaced concreteness is a natural tendency of thought. We will call such tendencies that influence what we think is real or true “epistemic drives.”[37] Fabrice Clément describes the phenomena thus:

> Understanding goes then hand in hand with a phenomenal experience that is highly positive…Still from an evolutionary angle, the “aha” experience that follows the puzzling “hmm” has been selected to (1) indicate to the organism that an explanation has been reached, (2) encourage the explanatory effort by providing a rewarding emotion. This kind of “cognitive emotion” could therefore explain the epistemic drive that can be observed in children (and *scientific* [my emphasis]) behavior (Clément, 2003, pp. 74-75).

Within this general phenomenon of the drive to understand or find meaning we can differentiate a number of sub-phenomena. The above mentioned “drive” toward certainty and the “dive” to create definitive category boundaries are examples of epistemic drives. There are others worth exploring. If we inspect our own thoughts, and evaluate the ideas of others, it is clear that the human mind is propelled in part by drives toward oneness, completeness, and wholeness. Some of this can be linked to low-level brain processes that turn perception into categories. One of the most basic functions of animal cognition is to group experiences into more abstract or encompassing categories; to efficiently distinguish friend from foe, food from poisonous plant, for instance. Beyond or abstracted from the basic biological imperative to categorize, in *human* thought we can see at work an interior ecology of polarities of epistemic drives that expose important fundamentals of thought itself. I call it an ecology because for each drive there is one or more opposing drives, all competing for attention and keeping each other in check. For instance, there is a drive to notice differences as well as one to perceive wholes. I list below some polarities of epistemic drives that are significant to epistemology and metaphysical thinking. This is not intended as rigorous treatment but as a rough list of overlapping phenomena to illustrate the concept of epistemic drive.

---

[36] As is alluded to in the Appendix, we can show related but distinct types of developmental progressions related to experiences, concepts, statements, and models.

[37] In an earlier version of these ideas presented at the ITC-2010 conference I thought I had coined this term, but a quick Google search shows that this is not the case.

Some Polarities in Epistemic Drives

- Abstract (ideas) vs. concrete (tangible, sensory, real)
- General (generalization) vs. specific (specialization)
- Universal vs. relative (or contextual)
- Fundamental (essential, central, root) vs. consequential (peripheral or subordinate)
- Permanent (unchanging, fixed, predictable) vs. changing (transient, unpredictable, chaotic)
- Oneness/singularity/unity vs. multiplicity (the many)
- Whole (holism; integration) vs. part (differentiation)
- Completeness (comprehensiveness; totality; systemic) vs. partiality (details, deconstruction)
- Perfection and purity vs. imperfection

It seems that integralists, and those drawn to theories and models in general, have a particular unconscious affiliation with the first item in each pair above. We can become aware of that in the human mind which wants to pull the disparate, the many, the diverse into a unifying whole; to achieve the simplicity and power of a general concept or rule; to determine and rest in what is at the center of, or underneath things. We can identify these drives or urges working within us at the level of felt experience. There is a sense of ease, certainty, and mastery when we can ignore details and differences and trust a sturdy generality. There is a sense of elegance and wholeness when we can embrace many things into a circle of unity. We get a certain satisfaction from ordering things or collecting them into tidy groups. The inquisitive and meaning-hungry mind wants to know the causal root, foundation, source, or origin of things. The constructs of the good/true/beautiful and I/we/it and gross/subtle/causal have a pleasing epistemic pull to them that makes it more difficult to see the manifestations of misplaced concreteness.

I use the term “drives” in analogy with other biologically innate “emotional” drives such as the drive to reproduce, the fight/flight/freeze responses, territoriality, maternal/paternal care, and social dominance/submissiveness drives. A plethora of drives exist within us, mostly dormant until conditions trigger them, and often in competition (will I eat or play? fight or run?). Our drives are essential tools for surviving and thriving, and can also create problems. In humans basic drives get transformed or built upon, sometimes in ways that seem quite distorted compared to their original intent (fear becomes anxiety, sexual drives become fetishes, the drive for hygiene becomes obsessive-compulsive disorder, etc.). In naming “epistemic drives” I call attention to their unconsciousness and pervasiveness, but also to our ability to meta-manage them. With our drives to eat (or over-eat), sexually flirt, become angry when challenged, and so on, our lives are improved when we reach a stage of development in which we are aware of and can control or compensate for them (i.e., when subject becomes object for any given drive). The term epistemic *drive* also emphasizes that we never completely outgrow or eliminate them, that they can raise their heads unexpectedly in many contexts, calling for an ongoing awareness and cognitive management. As shown with misplaced concreteness, epistemic drives are like emotional drives in that we become aware of and learn to manage them at ever deeper and more nuanced levels, but meanwhile they keep showing up in ever subtler ways, so the developmental learning process continues indefinitely.

The epistemic drives toward wholeness, completeness, and essentialness not only help us accurately understand and make meaning of the world but can over-function to create biases, errors, and ethical problems. Phenomena such as grandiosity, hegemony, elitism, and proto-fascism are extreme cases. But in less extreme ways the subtle influence of such drives pervades the creation, consumption, and promotion of theories, models, and belief systems. As with prescriptions to avoid bias and be objective or avoid selfishness and be altruistic, avoiding metaphysical thinking to take a post-metaphysical stance is more about ongoing attention and deepening wisdom (i.e., skill building) than adopting a belief or philosophical position. Simply understanding and agreeing with the prescription (to, for example, avoid bias, selflessness, or metaphysical thinking) is only the first step in enacting the idea; and seriously taking on the project requires developing a deeply felt understanding of the push and pull of cognitive and emotional forces within.

Doing Post-Metaphysics: Integrity and the Role of Emotion

This brings us to the issue of *enacting* the post-metaphysical stance. First, as mentioned above, we must distinguish between the explicit or “espoused” belief in or knowledge of post-metaphysical principles (such as “don't confuse the map with the territory”) and their skillful and habitual application. Second, we see that enactment requires both a deep familiarity with a number of habits of mind (misplaced concreteness and other epistemic drives) and the multi-context practice and trail-and-error learning required for development. Third, we can acknowledge how the emotional and ego-related characteristics of each situation affect our ability to enact the post-metaphysical stance. Developmental capacities can “gear down” to lower levels in the face of stress or complexity. The drives to have our abstractions and ideas be more true, more real, encompassing, fundamental, and essential is exacerbated to the extent that fear, anger, urgency, or ego-attachment are involved.

Phenomenologically (and epistemologically), the ascription of reality or truth to an idea is a matter of intensity or degree of certainty, rather than an all-or-nothing matter. We assign more concreteness to abstract ideas that matter more and that we are more certain of (and vice versa). One's degree of certainty in an idea (how strongly we hold to its reality or truth) is tied up in emotion-laden evaluations of the importance, urgency, and consequences of an idea. Thus we can acknowledge that, regardless of one's developmental level, misplaced concreteness and a number of other epistemic drives and cognitive biases are affected by emotional context. Though a description of the findings in this area are beyond my scope here, I will merely point to the vast body of scientific work showing strong connections between emotional processes and reasoning processes (Damasio, 1999; Fischer et al., 1990; Goleman, 1995; Matthews et al., 2002).

Integralists, in embodying their philosophies and visions, are called to a particularly high level of *integrity* and ethical development. I define integrity as congruence between four categories of phenomena (actions, words, conscious beliefs, unconscious beliefs, in order of increasing difficulty and development): that actions follow words (e.g., we do what we say we will do); that words follow conscious beliefs and thoughts (i.e., authenticity and transparency); that conscious thoughts and beliefs align with unconscious ones.[38] The final step can be expected only in the high developmental levels of self-reflective capacity that turn emotional reactions, unconscious drives and motives, and even the processes of thought and language themselves, into objects of inquiry. Thus, though it is difficult, integralists are called to hold deeper reflective meta-perspectives on how their own cognitive and social belief-generation processes work, in able to hold their beliefs post-metaphysically.

Yet even as we call for a more fully post-metaphysical approach to integral beliefs, post-metaphysics, based on modern revelations about how the mind works, brings with it the humbling understanding that we are wired with epistemic drives that unavoidably compel us into magical, mythical, and conventional modes of thought. The more that useful prescriptions like “don't confuse the map with the territory” become catchphrases that are repeated without an acknowledgement that doing so can be difficult and subtle, the greater the social pressure against admitting the natural prevalence of such phenomena. The social pressure to avoid these sorts of errors hinders authenticity and inquiry. One measure of second tier community is a group's capacity to empathically consider, allow for, and learn from such vulnerabilities.[39]

The Validity of Meaning-Generative Claims

In this section I will suggest that for many of the knowledge claims that constitute integral theory and the integralist belief system, it is better to use “meaning generativity” as a source of validity, expanding the established set of validity types beyond the standard model of the true, the good, and the beautiful. The concept of meaning-generativity may help integralists assert and promote important ideas with sufficient forcefulness, while still communicating a post-metaphysical or reflective stance that acknowledges the fallibility of ideas.

In *The Way We Argue Now: A Study in the Culture of Theory,* Amanda Anderson (2006), siding with Habermas, attempts to reclaim the concept of “critical distance” from the deconstructive and relativist malaise that, she argues, overtook scholarship in the late 20th century. The concept of rational, reflective, or critical distance gained a dismissive reputation for being “impersonal, abstract… arid… irrelevant, or elitist” as its detractors “valorized ideals of embodied identity, feelings and passions, ethics and politics...existential meaningfulness and moral force” (p. 2). As is often noted in integralist texts, it is not necessary to throw the rational and reflective baby out with the dirty bathwater identified by postmodern scholars. Even in conversations that valorize identity, feelings, ethics, etc., it is the reflective powers of reason that allow us to manage the complexity that arises in practical situations involving numerous interacting and often conflicting voices, needs, and perspectives (both externally and within oneself).

---

[38] Integrity also implies congruence among the objects within any of the four levels (actions, words, conscious beliefs, unconscious beliefs) in different life contexts. For example: acting or speaking to one group in ways that contradict what one does or says to another group constitutes lack of integrity. Also, if conscious beliefs or unconscious drives exist within us in a kind of unhealthy conflict or turmoil, this points to a subtler lack of integrity. Technically we can not know what is in the unconscious, but a large body of work deals with revealing this territory and healing it (making it whole and harmonious).

[39] Shifting from the mundane uses of metaphysical thinking to its philosophical uses, we can note that the post-metaphysical approach has been made possible only with relatively recent understandings of mind and epistemology. Great philosophers including Plato and Hegel were trapped in metaphysical binds. Habermas notes (1992, p. 6) that "even Nietzsche, in his rejection of Platonism, remained attached to the tradition's strong concept of theory, its grasp of the totality, and its claim to a privileged access to truth." Metaphysical thinking is in esteemed company, and not to be derided out of hand.

Let us return again to the question of how one holds what integralists think are highly important or useful ideas (see Table 1); for example, “spirit is evolving through us;” ideas about involution and evolution; the integralist understanding of the traditional, modern, and post-modern cultural systems; or that something like spirit or higher self exists. Pick any cherished idea that you have tried to explain to another. To make a claim is to imply that one has reasons to back it up (see Habermans, 1981).[40] There are numerous types of reasons or justification modalities that one can use to explain or justify a claim. Though some have argued that his scheme is too simplistic to cover all cases (e.g., Cooke, 1994), I will refer to Habermas' model as it is widely acknowledged and is consistent with integral theories. Habermas claims that, in modern (and post-modern) cultures we make three types of claims, which, in integral-ese we would call claims about truth, ethical goodness (or moral justness), and beauty (which are intended to reveal something about objective, intersubjective, and subjective realities). Claims in each domain have a different basis for validity.[41] Though there is much in integral theories that speaks to ethics, for the most part integral theories are truth claims. Theories such as AQAL describe the way the world works (in all four quadrants), and only secondarily make claims about how people *should* act or how society *should* be structured. Thus our concern here is primarily with truth claims.[42]

In modern (or post-modern) contexts the nominal “gold standard” for the validity of truth claims rests on something like the scientific method, i.e., something like Wilber's three strands (or any extension of it) as described above. In the ideal case we anchor our explanations in objective facts, rigorous empirical methods, trusted impartial sources, multiple validations and perspectives, etc. To base the certainty of ideas in the authority of a holy text, a religious leader or king, a gut feeling, what our ancestors said, what a popular film or sports personality said, or what “everyone” says (or even “because I said so, stupid”), would, though these are common modes of reasoning that we all use, be judged by many as using an inferior mode of reasoning. From a developmental perspective we would call these (sub-gold-standard) modes of reasoning conventional or pre-conventional—while the gold-standard is a post-conventional mode.

---

[40] Habermas suggests that "we understand an utterance when we know what makes it acceptable." Thus to agree with an idea is to make assumptions about reasons that back up an idea, and to make a claim is to implicitly guarantee that the claim can be justified with reasons (Habermas 1983, V. 1, p. 297).

[41] Habermas says that speech acts actually imply claims in all three domains, with one being primary (Habermas, 2003).

[42] "Pathos" and "ethos" are essential elements in belief formation. We don’t dismiss them here but rather focus how to talk about the truth-related and epistemological aspects of claims.

In exploring or promoting integral ideas we are called to at least live up to post-conventional modes. There is a certain burden of proof that falls upon us in promoting or explaining integral ideas in a way consistent with our aspirations to communicate from a post-conventional stance (not to mention the more demanding post-metaphysical stance).[43] Both the importance and difficulty of doing so is exacerbated by the fact that many of the ideas traded in integral circles are from the domains of social science or philosophy (including "reconstructive" sciences and, even more problematic, spirituality)—domains which are plagued with indeterminacies that the physical sciences (or mathematics) are relatively immune from.

According to Oberschall (2000) ninety percent of social theories rise rapidly only to fall into oblivion (as cited in Wallis, 2008). In general, social and human science theories are difficult to test (validate or falsify; see Popper, 2002; Wallis, 2008). Bent Flyvbjerg claims that "we must drop the fruitless efforts to emulate natural science's success in producing cumulative and predictive theory; this approach simply does not work in social science" (Flyvbjerg, 2001, p. 166). Roy Bhaskar, in his theory of critical realism (1975; and see Collier, 1994), notes how all human systems are complex *open* systems in which we can never isolate any causal mechanism for rigorous experimentation. According to Bhaskar, we are thus constrained to positing the existence of "tendencies" (rather than laws) that occur "all other things being equal" (which they never are, actually).

If we are constrained to a more classical truth-claim model of validation in such domains, making strong claims or advocating that others should take up ideas, is problematic. Modern norms do seem to imply that we should offer solid "proof" or rigorous argumentation for these highly fallible ideas—yet often none exists. While, if we are honest with ourselves, we can admit to a conviction, even a strong sense of validity, for some of our ideas that can not be backed up in this classical modernist way. In his book *Alchemies of the Mind*, social scientist Jon Elster (1999) notes, in agreement with others mentioned above, that psychology, sociology, ethnography, political science, etc. have had little luck in predicting phenomena, and he views "the ideal of law-like explanation [in] the social sciences as implausible and fragile" (p. 1). However, he offers an alternative path to truth-claim-like justification. He suggests that claims in such areas, even if they do not provide the predictive power of laws from the hard sciences, provide powerful *explanatory* power. Elster suggests "explanatory mechanisms" as a term for claims that are not as provable as scientific laws, yet have more explanatory power than mere descriptions. Integral theories are rife with such principles which help us explain but not predict human behavior.

This begins to suggest that there may be valid ways to justify our highly fallible beliefs in post-conventional or post-metaphysical ways. Before offering my argument for a "meaning-generative" type of validity, I will add one more element which touches on the ethical questions in making claims in highly fallible areas. The post-metaphysical stance to beliefs takes seriously questions such as: How can we speak passionately or forcefully about ideas for which we can offer little evidence? And: Is it ethical to speak with certainty about beliefs that we know are quite fallible? These are difficult questions in part because we are often at the same time trying to communicate some idea we hold as true (the locutionary or so-called “communicative” aspect of the speech act) while we are also trying to influence the listener to take some action (the illocutionary or strategic aspect of the speech act).

---

[43] Cooke, in explaining Habermas' approach to communicative rationality, refers to *post-conventional* modes of dialogue as including "the idea that no validity claim is exempt in principle from critical evaluation in argumentation" whereas in conventional (or post-traditional) modes "what counts as relevant is narrowly and rigidly defined according to fixed prevailing conventions" (1994, pp. 32-33) *Post-metaphysical* modes, as used in this paper, are more sophisticated than post-conventional modes, in that they not only admit to the fallibility of knowledge, but incorporate some insights about the nature of that fallibility (and thus the nature of knowledge and communication, as discussed in this paper).

The full elaborated “truth” of an idea as we understand it may entail many elements that mitigate our certainty in it. For example, one may say that “medical costs are high mostly due to profit hoarding in the pharmaceutical industry.” Yet one may also know facts, or be familiar with valid perspectives, that argue against the claim. In any discursive contexts we do not pass on facts or ideas for no reason—we have reasons, and they may be hidden from the interlocutor (and may even be invisible to us). In the above case let us assume one's attempt to argue for this idea is part of a more encompassing agenda to influence another's worldview about some larger topic (government, or medicine, or the economy). Given this goal one will focus on facts supporting one's idea and ignore contrary facts; and one will speak with more certainty than if one were engaged in an open inquiry rather than a persuasive act. But this presents ethical dilemmas—we are allowing for a partial falsehood in order to affect some greater social good. One partial way out of this ethical bind, in which we must balance our desire to persuade with our desire to be completely truthful, is to enact a more reflective stance to our communicative acts.

Arguments from a post-metaphysical stance tend to be more self-reflective, authentic, transparent, and ethically centered. For example, one might say “I will argue strongly for this because I think that is what is needed here but I will also admit up front that I sometimes have my doubts;” or “I think this theory is a perfect fit for moving your agenda forward but I need to hear more about how you understand how it meets your needs before I continue,” or “I will be putting on my activist hat here, and will be trying to connect with your emotional mind more than your rational mind, and might be ignoring some of your counter-arguments while I do so.” This level of reflectivity and transparency gives us another tool for explaining or promoting integral beliefs.[44]

The act of communication is a balancing act in which we weigh (1) sincerely communicating what we know (or suspect) to be true and relevant about a topic (which can have many layers, branches, and ambiguities) against (2) what we strategically wish to accomplish (which can include not only persuasion, but things like making a good impression, avoiding conflict, and not wanting to spend too much energy on this conversation); and (3) our moral/ethical sensibilities about how to do right by others.

---

[44] This approach has commonalities with many progressive communication and facilitation models. For example, Roger Schwarz's "mutual learning" approach for empowering participants and minimizing a group's dependence on a facilitator suggests that facilitators be transparent about their facilitation strategies, communicating the reasoning and intent behind their comments, questions, or actions (Schwarz, 2002, p. 113).

Putting all the above together I suggest that what is needed to balance these three goals when we promote some integralists beliefs is a more general acceptance of (and transparent communication about) “meaning-generative” claims.[45] That is, that we can note explicitly that we hold and promote an idea simply because it helps us make sense of the world, and offer that it may do the same for others. Just as truth, ethical, and aesthetic claims each have their own rules of engagement (or valid ways to counter them), so do meaning-generative claims. Just as “but you can't prove it” is not a reasonable counter to an ethical or aesthetic claim, it is also not a valid counter to meaning-generative claims.[46] Meaning-generative claims are akin to Elster's explanatory mechanisms, but can be broader. They are different than aesthetic claims, which need only expose one's personal subjective impression, in that they presume that the idea will help another make sense of (or explain) some aspect of the world.[47]

Beliefs that cannot be “proven,” or that we don't even care whether they can be proven, can nevertheless be quite valuable to hold and communicate to others. For example, I “believe in” reincarnation because, though I have no direct empirical experience supporting it, it counteracts existential despair, is held by people I admire, and coordinates well with a number of other beliefs and intuitions I have—I do not expect to or need to convince anyone that reincarnation is real,[48] though I might offer an argument for it. A claim affirming reincarnation is valid for many because it is meaning-generative, not so much “true;” yet it is more than merely “good” or “beautiful.” The same approach can be taken with the teleological “evolutionary spirituality” perspective on human development: that “the universe is evolving—through us.” This Eros-based belief has strong meaning-generative power for many, but to have to “prove” it in any logical way is impossible and beside the point, yet it is not merely a moral/ ethical/normative claim.[49]

I will not argue that adding “the meaningful” to “the true, the good, and the beautiful” adds some perfect missing link to the formulation—the idea has not been worked out with much rigor here. Rather, I am suggesting that it performs an important function in post-metaphysical communication that the other three do not adequately address. Two hundred years ago, Kant saw that culture evolved to differentiate the true, good, and beautiful as separate validity claims in the modern area, and I am suggesting that in the (post-) post-modern era we are beginning to (or needing to) differentiate yet another form that is something like the meaning-generative. The *meaning-generative potential* of a claim can be as or more important than its truth value for highly fallible or un-falsifiable claims.

---

[45] I will not present any full theory of meaning generative claims, but outline how the concept might be useful in practical communication.

[46] Note that I am not talking about the move from definitive knowledge or facts to simply a hypothetical or probabilistic framing of claims, but rather am describing an explicitly reflective stance on idea communication.

[47] This uses a simplistic I/we/it definition of aesthetic claims—other more elaborate interpretations of the aesthetic claim are possible that may be closer to the meaning-generative claim (see Duvenage, 2003).

[48] See the Appendix for an explanation of how most beliefs have multi-sourced justifications.

[49] In Habermas' theory a truth claim implies an argument for universal validity—i.e., even if put tentatively, it implies that, if it turns out to be "true" then it should be true for all who yield to the force of the argument. Meaning-generative claims are more akin to aesthetic claims in this regard, in that we do not expect them to be true (or even useful) for everyone.

If we can speak in terms of meaning-generative potential we gain some freedom from the straightjacket of conforming to modernist/quasi-scientific justification modalities and have more flexibility in talking about beliefs that might be called metaphysical or quasi-scientific (even pseudo-scientific). For example, though personality and capacity typing systems such as Meyers Briggs, Enneagram, Spiral Dynamics (thought they vary greatly in their demonstrated empirical validity) all suffer from serious discrepancies and other challenges within the body of empirical research. In addition, users and adherents to each type of framework have an affinity to their chosen model that is best explained by pointing to its meaning-generative potential for them. Empirical studies may not impact one's affinity to such models, in part because experimentation in such domains is so difficult that it is easy to dismiss any single study.

I am not suggesting that society (or the integral community) adopt an even more rampant lack of rigor or “truthiness” (or “bullshit,” as described by philosopher Harry Frankfurt, 2005) than exists already. Rather, the current modernist valorization of logical and scientific results, in providing no way to speak to meaning-generativity as a validity type, creates an unhealthy pressure to use and misuse scientific evidence (which then begets pseudo-scientific arguments) as a false justification for ideas and frameworks that are used largely because of their meaning-generative potential. The post-modern swing in the opposite direction is equally incomplete.

The suggestion here is not to de-valorize rigor, but to provide valid alternative justification modes that allow us to more rigorously and reflectively differentiate when we need scientific rigor (or modernist forms of rationality) and when we don't. The invitation is not to abandon the modernist aim for sturdy truths in favor of appeals to identity or pathos, but to explicitly include a reflective level that speaks directly to the nature and fallibility of communication and belief.

Conclusions

In this paper I have explored the concept of post-metaphysics and what it might mean to entertain a deeply post-metaphysical approach to integral beliefs and frameworks. I have mentioned the developmental progression in the way people hold and justify beliefs. Developmentally earlier modes, including magical, mythical, and conventional thinking, are less concerned with the universality or portability of claims, that is, at first tier one is less aware of how those who do not hold one's worldview might interpret one's claims. The New Age beliefs listed in Table 1 are often held in this way. As in all communities of affiliation, inquiry and/or practice, the integral community also demonstrates an insular belief reproduction “echo chamber” effect. Constructs such as “non-dual,” “development,” and “Agape” take on a particular meaning that is treated as if it is the only meaning, and certain ideas like “the cognitive line precedes other lines” get passed around the circle as truths taken for granted. A deeper “indeterminacy” analysis of the truth or reality of these constructs and beliefs is all too rare.

Though this phenomenon is not only typical but it is an unavoidable aspect of group belief formation (including academic disciplines), there are several things to note about it relative to the integral community. First, because (we will assume that) the integral vision tends to attract individuals at relatively high developmental levels (compared to other communities of theory or practice), it has a relatively high capacity to reflect with epistemic wisdom upon its constructs and beliefs. Second, counteracting this, the integral community is unusual (though far from unique) in how much of its core constructs and truths are attributed to one (extremely talented and productive) person or founder, i.e., Wilber. This, and the fact that the integral project blurs the lines between scholarly and social spheres (e.g., with Integral Institute sponsoring Integral Life as well as academic programs) has the effect that much of the knowledge passed around is not viewed as critically as it might be. "Wilber is brilliant, and we are all pretty smart, so these things I keep hearing others say over and over are pretty likely to be valid." Third, because integral theory is so fundamentally interdisciplinary, broad, and far-reaching, and has such great potential for wide impact, it must pay exceptional attention to the portability of its constructs and beliefs to realize its potential.

Thus, within the integral community there is great potential and a particular calling to bring epistemic wisdom to our inquiries, yet factors exist that make it more difficult to do so. In this paper I have tried to offer some preliminary suggestions and tools supporting the enactment of post-metaphysical approaches to the creation, critique, and proliferation of integral knowledge and belief systems. These focus on epistemic skillfulness around one's relationship to belief, knowledge, truth, reality, critique, justification, and certainty. These suggestions and tools include:

- Suggesting that enacting post-metaphysics (and second tier development) involves a deeper understanding and awareness of *cognitive processes* as mentioned below;
- Highlighting how the indeterminate nature of *abstract concepts* influences the fallibility of statements and models;
- Mapping out the different epistemic concerns involved in *concepts, statements, and models/theories;*
- Relating epistemic questions of truth, reality to psychological phenomena such as *misplaced concreteness, epistemic drives,* and emotion; one's judgment of certainty or reality is influenced by factors such as importance, fear, and urgency;
- Pointing out how *magical and metaphysical thinking* are manifestations of misplaced concreteness; which occurs in different ways at different developmental levels;
- Articulating the difference between positivist approaches and *negative capability* in integral theories, and suggesting additional focus on or balance of the later;
- Suggesting how *indeterminacy analysis* can bring a more post-metaphysical perspective to models and theories;
- Suggesting that *meaning-generativity* be used more widely as a way to justify claims that have metaphysical implications.

In conclusion, for second tier thinking, wisdom skills are more fundamental than any particular set of beliefs or models. *Whether* we believe in a god, or in capitalism, or an evolutionary omega point, is less important than *how* we hold that belief, and *how* we hold it is a matter of skills. I have made an early exploratory stab at describing some approaches useful for post-metaphysical belief-holding. With these and further developments, we can aim for the *ego-awareness* to reflect on our attachment to it; the *relational-awareness* to listen deeply to someone with an opposing belief; the *construct-awareness* to hold the paradoxes implied in the belief; and the *systems awareness* to see how that belief relates to other beliefs and to systems of action. And we can aim for the second tier wisdom to reflectively choose what and how to believe and to use that belief as a sturdy tool in ethically-relevant work, and let go of it when it is not useful. The long road ahead brings the challenges of how we will define, assess, and support such skills in our domains of application.

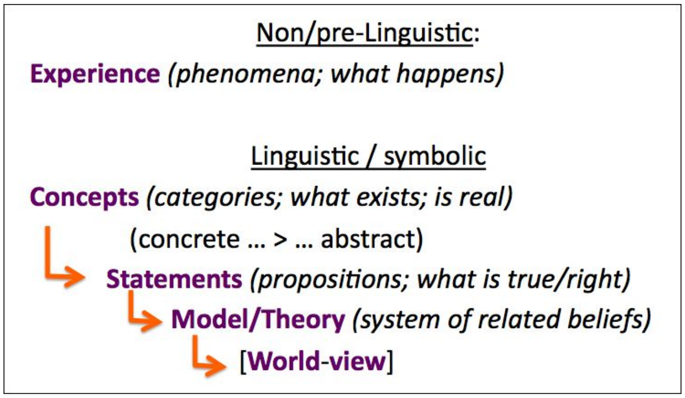
Appendix: From Concepts to Statements: Modes of Justification and Critique

In this Appendix I discuses several ideas referenced in this article that I believe contribute to taking a post-metaphysical stance, which I will work out in more detail in future papers.

In discussing post-metaphysical approaches to knowledge it is useful to differentiate several types of knowledge as in the following figure:



Non/pre-Linguistic:

Experience *(phenomena; what happens)*

Linguistic / symbolic

Concepts *(categories; what exists; is real)*

(concrete … > … abstract)

Statements *(propositions; what is true/right)*

Model/Theory *(system of related beliefs)*

[**World-view**]

Figure 2: Categories of Knowledge/Belief

On Experience

Experience and other non-linguistic or pre-linguistic phenomena exist in the top category. These form the basis of (symbolic) concepts and ideas. These are not meant to be completely raw or unfiltered, as all experience and sensation gets filtered at a very early point. This category points to one's belief that “this is a tree” or “I should take this job” before I put words to it (internally or verbally). Included in this category are “intuitions” before they are conceived in words and symbolic categories. This category is a catch-all that points to everything that we “know” prior to (or without its) manifestation into symbols and language. I offer no detailed or scientific treatment for this vast category (though many exist; see Martin Heidegger; Jason Brown; Antonio Damasio), but name it to point out that all attempts to ground knowledge, belief, or mutual understanding draw upon this level. The validity of verbal abstractions, i.e., the linguistic/symbolic forms listed in the figure, depends on references to this Experiential level.

I will make one interesting point about Experience in light of our discussion of metaphysical thinking. Though we treat an experience such as the taste of chocolate as mundane and an experience such as a meditative state of witness-consciousness or non-dual oneness as sublime, they share some interesting properties along with all experiences. They are essentially indescribable to any who have not experienced them. In the movement from experience into language describing the experience both loose what they are and become something else. Concepts and abstractions built upon the taste of chocolate are not so different than concepts build upon sublime spiritual experiences in that they are equally susceptible to indeterminacies. Both are equally beyond words and in that sense mysterious. The main difference is that tasting chocolate is common whereas advanced meditative states are not. Therefore there is more intersubjective commonality about the taste of chocolate–less ambiguity about what one means when they speak of it. Because of our tendency to take abstractions too seriously (misplaced concreteness) it seems to us that that *concepts*, the *ideas*, and the *theories about* meditative states are particularly sublime, esoteric, and special. However it seems more accurate to say that it is only the *experience* that is sublime and special.

On Concepts and Models

The primary purpose of the diagram in Figure 2 is to illustrate that (a) models/theories are built from statements and statements from concepts; (b) that indeterminacies as any level accumulate from indeterminacies at lower levels; and (c) that each level has its own epistemic concerns. Example Experiences include the taste of chocolate; a gut certainty; a meditative state; and what it is like being a parent. Example concepts include tree, democracy, interior, and consciousness. Statements have forms such as “trees are…” “we should…” and “the cognitive line leads other lines…” Example models/theories include AQAL, Spiral Dynamics, Einstein's Theory of Relativity. Concepts are primarily about what we think exists (or can be differentiated from other things). Statements are claims about what is true, good, right, beautiful, etc. Models and theories are systems of related beliefs. I include “world view” in the diagram to note that we also speak of larger scale belief systems.

Justification Types

In this paper I emphasize the ontological functions of the mind that infer what is *real*, i.e., the conceptual level in the Figure. But the post-metaphysical turn also involves the related epistemological functions that infer what is *true* and determine how we argue for claims—i.e., the level of Statements and their justification. Figure 3 lists most of the modes we use to justify or explain claims.

- First hand **experience** (seeing is believing)
- **Someone I know** and trust believes it;
- Someone in an **authority role** suggests/demands that I believe it;
- Most people (**peers** in my group/tribe) believe it;
- I have a deep **intuition** (or gut feeling);
- Is **ethically** right to believe it;
- Is pragmatically **useful** (it works);
- Is **consistent** with my other beliefs (as are its explicit/implicit implications)
- Has the support of **experts** or ;trusted sources (journal, NPR, etc.)
- Has reasonable **assumptions**/bases/ premises
- Follows from **Logical** inference (supporting truths);
- I used a trusted **method.**

Figure 3: A list of knowledge justification modes

In the section on misplaced concreteness I gave an account of how misplaced concreteness, or the real-ness with which we treat abstract concepts, manifests itself through developmental levels. We can do the same for the level of Statements and justification types. Many theorists have demonstrated a developmental progression in the ways that humans (explicitly and tacitly) understand and justify beliefs (e.g., Perry; Fisher; Kegan). Very roughly, early forms are based on appeals to authoritative people and texts, sacred objects or beings, group norms, intuition, and direct experience. Later forms are based on logical inference, coherence with foundational tenets and existing "truths," and methodologies and sources that minimize bias. Yet later forms acknowledge and try to compensate for the fundamental indeterminacies and fallibilities of all of the validity bases. *All* of the mentioned modes of justification are (almost) *always* involved in complex life deliberations. It is not a matter of leaving any behind but of having more options to choose from and becoming more skilled in when to use each.[50]

As compared with Modernist or Integral modes, beliefs associated with New Age (and Green) culture rely less on logic, bias-checking, and rigorous methodologies (such as the scientific method). Assessing the Green worldview is complicated because of a combination of influences from both higher and lower developmental levels. Though sometimes the more primitive thought modes are embraced unreflectively, in other cases sophisticated postmodern arguments (e.g., deconstructive arguments) are used.

In rejecting Modernist ways, Green opens the door to magical thinking (indulging non-differentiation of ideas and concrete realities) and narcissistic thinking (including grandiosity and wishful thinking) (see Hanley, 1992; Habermas, 1991; Murray, submitted). Green thinking also applies valid postmodern insights about the fallibilities of rational thought and the scientific method, and the inevitability of human bias (it also is drawn to Romanticism which values feeling good and aesthetic value over rationality). The topic of *intuition* becomes particularly interesting, because, while basing belief on intuition can be a cover for non-rigorous thinking, Habermas' entire project is based on the 'rational reconstruction' of quasi-universal intuitions.

---

[50] It is not clear where Wilber's "eye of spirit" knowledge would fit in this scheme. Though it may come from a deeper realized state or stage experience, I suggest that in dialogue it is the same set of justification principles that must apply.

Rethinking Our Relationship with Global Change
An Interview with Stewart Brand

Russ Volckmann

Introduction

I recently mentioned to a group of PhD students in my class that I was going to be publishing an interview with Stewart Brand. I am guessing that they range in age from early 30s to 50ish. Only the older student had heard of Stewart Brand. So I mentioned it again in another PhD seminar—same response. And many of these students live in the San Francisco Bay Area!

Why am I surprised? Well, in the late 1960s and 1970s the Whole Earth Catalog and Stewart Brand were well known to most of the people I knew. In fact, I had attributed to the Whole Earth Catalog a significant role in causing many young people to leave the city and move into rural environments while seeking a more "natural" holistic lifestyle.

Then, Stewart Brand's role in creating the Co-Evolution Quarterly and his frequent writings in it might have meant something to this "younger generation" (1974-1985), but no. Or Brand's presentation at the TED conference in 2009 (http://www.youtube.com/watch?v=TuxwiVFgghE) might have brought him to the attention of these world-aware searchers for meaning, but still no. Perhaps his most recent book, Whole Earth Discipline, Penguin, 2009, 2010)— no again.

The latter is remarkable because Brand is speaking to many of the core values of the green movement regarding what is required to save the species, if not the planet, from extinction or very severe reduction (the loss of billions of lives). Others of his book fared no better: Space Colonies (1977), The Media Lab: Inventing the Future at M. I. T. (1988), How Buildings Learn (1995), The Clock of the Long Now (1999).

In the winter of 1978, Brand wrote in the Co-Evolution Quarterly, after an event of many 5-minute speeches,

> I've been wanting to see what I'd do at the end of all this, other than be glad that it was coming down to a chance to go and take a bath. The words that kept coming back to me through the sixty-some speakers we've had, was some kind of dialogue that goes on between grasp and reach. Ten years ago we reached for something with the *Whole Earth Catalog*. A lot of us reached for various things—some to stop the war in Vietnam, some to save various species, some to find a way to stay high. And we have spent ten years refining our activities so that our grasp could catch up with that reach. That's part of this strange transition that many of us have made from something like an outlaw to something like a citizen.

SOME RIGHTS RESERVED

> I think we're different citizens and more valuable citizens for having been outlaws, and I think we're, maybe more forgiving toward the present and hopefully oncoming set of outlaws. I hope that there'll always be that dialogue.
>
> But for ourselves each time that the grasp catches up with the reach and we come to do something rather well—well enough that it's as if we could do it in our sleep—then probably we are doing it in our sleep. You might think about that grasp that you've got now, the refinement, the citizen quality of your behavior. I mean, I'm having to notice that I'm sitting on boards now. They're wonderful boards: Bread and Roses, Magic Theater, Neighborhood Foundation, in Sacramento I wear a three-piece suit.
>
> I start to look at the boredom, the tedium that comes with doing what you've done well for a very long time exclusively. I think this is the kind of thing that often overtakes public figures, and we…often force that on them, by insisting that Ralph Nader be strictly Ralph Nader. I'd love to see Ralph Nader trash a car in some fundamental sense. All of us have this corner that we get into by being public or by being good at what we're doing.

This is one of the qualities of a thinker and a doer like Stewart Brand. He has not for very long let the boredom overtake him before he has moved on, expanded his activities, created a role for himself to bridge different domains of world energy and power. In no way has this been more clearly demonstrated in the spiral of his activities from the libertarianism of the Whole Earth Catalog to the active community involvement and advocacy for coordinated world efforts to save the species.

In 1968, in the "Purpose" of the Whole Earth Catalog, Brand wrote: "We are as gods and might as well get good at it." Here it is—2011—and he is encouraging us to step more fully into our godlike role to create a generative future for the human race. We are challenged by the fact that the "engineering/scientific" mentality that has dominated Western (particularly American and US-influenced) cultures has been the expert, the engineer, the scientist. A key question is, how can we step more confidently into that godlike role and not end up with disastrous results. Here is what Stewart Brand has to say on the subject, in our conversation concluded before the Fukushima nuclear disaster.

Russ: *I thought about starting this interview by saying, "I'm talking to a man who needs no introduction," but then I remembered that not everyone grew up in the sixties and spent their time in Berkeley like I did. And not everyone learned about the Portola Institute, which I thought was a brilliant piece of work, especially with the motto, "Fail Young,"—I've taught about that in classes for many years. Then there is all of the things that you've done with the Whole Earth Catalog. There are the adventures you've had in the dynamic social and cultural climate of the San Francisco Bay Area—right down to the famous Otis Redding song, "Dock of the Bay," composed on either your house or office boat in Sausalito on San Francisco Bay. There are so many people who probably don't know so many things about you, yet you are still making an incredible mark on the world. You* *recently published a Whole Earth Discipline which is something I'd like to learn more about.*

I did my PhD at Berkeley in Political Science. When I asked you for this interview, I indicated that I was interested in how you think. On page 227 of your book, you reference another Berkeley political scientist, Philip Tetlock, who said, "How you think matters more than what you think." And you went on to talk about foxes and hedgehogs—I think that was the metaphor he used. Yet it seems to me that you're also saying that what you think and how you think about it matters an awful lot. You have indicated that making mistakes, learning from your mistakes, and changing your mind is an incredible part of how you think. Do I have that right?

Stewart: Well, you mentioned foxes, and scientists are trained to be foxes. They are trained to be persuaded by better evidence or a more persuasive model as more of a sense of what's really going on in the world. I think one of the debates that's happening within the environmental movement across the board—and not just with me—is that there is a fair amount of ideology that is rather hedgehog-like; there will be a hedgehog-like view that basically says, "What nature does is always good and what people do is always bad." There are exceptions to that, but that's the basic rule. So that's just useless. It's kind of comforting and makes one feel good when out hiking and things like that, but there are plenty of reasons to feel good when out hiking. However, it's really useless in terms of political action, knowing what kind of things to try to work on. In thinking about environmental problems, there are design problems that can be fixed rather than tragedies that can only be deplored. So the fox versus hedgehog contrast is one I brought up in this environmental book because I'd like to see a more foxy approach by Greens.

Russ: It seems to me that you're talking to people like me who have been very invested in some of the shibboleths, if you will, of ecology that included opposition to nuclear power plants, which you're advocating. You also stress the importance of cities and the use of bioengineering, genetically modified and engineered crops and the like. You make a very strong case for the value of Greens shifting to those positions.

One thing that comes up for me, and I understand you're a scientist, is that it challenges us to trust; it challenges us to trust the capacity of human engineering to address the ecological issues we have, even when it's high risk. Is that a fair statement?

Stewart: People got distracted by something called "the precautionary principle" that started out pretty useful. It started out in Europe when there was real evidence of harm caused by acid rain. There was not a clear sense, scientifically, of what exactly was causing it, but they started acting on partial knowledge to try to head it off. That was the precautionary thing to do, and that was right.

Then the precautionary principle got moved over to where if anybody could imagine how some new technology or technique or practice could somehow cause some kind of problem… It seemed to help if the person doing the imagining didn't know very much about things at all; then that was reason to try to prevent that technology or technique or program from going forward—because someone could imagine something terrible happening. And they were saying that basically one must not risk things. That's really wrong and basically nuts on two or three levels. I love the idea of precaution, and the thing that I am pushing these days is adding to the precautionary principle the vigilance principle that speaks to the political science view that the price of liberty is eternal vigilance. But the point is about liberty; the point is on trying things. Of course, in researching this book I looked for things that environmentalists felt were high risk, like nuclear power or transgenic crops and found that the opposite was the case—they're very low risk. There have only been three significant accidents with nuclear and only one of them caused death. That was Chernobyl and there not as many deaths as people thought by several orders of magnitude.

So the one area that really is risky is climate engineering—geoengineering. There you're doing a risk balancing. I'm pretty sure that geoengineering would only be deployed if there was a sense that climate was really going wacko on us and we were about to lose the rainforest or we were seeing that a trend was under way that was not going to be headed off by any of the modes that we're working on—mitigation, cutting back on greenhouse gasses takes a long time— the effect takes a long time. If we have to buy time with geoengineering, what we're doing is balancing the risk of messing with the climate. The nearest certainty is the climate is messing with us and with biodiversity in general. So that is a high-risk situation. The way you reduce the risk is to do lots of very serious research, which means doing, among other things, some interfering with climate in little bits and pieces—the way volcanoes do naturally—and get a sense of exactly how it responds and if the response is the sort of thing that one might want to roll out in the event of an emergency. So you're doing everything you can to reduce risk, but risk is never zero, and risk is always a question of balancing one risk against another.

So that's just kind of a practical, pragmatic approach that I'm trying to get back into the way people think about these things.

Russ: *One of the elements of that is the perspective that we, for the first time, are in a position to manage Planet Earth. Is that a fair phrase?*

Stewart: Turns out we've been managing it inadvertently for about 10,000 years, pretty much since agriculture got going some 10,000 years ago. You can even say it started once we began seriously modifying the landscape with fire on purpose, 50,000 years ago in Africa. All along we've been geoengineering, and we've been doing things on a scale that affects the atmosphere and affects the climate and affects a lot of things. We can't go back. We can't just stop affecting the Earth.

So we have a choice of either terraforming badly as we seem to be doing now, or terraforming well. But we no longer have the choice of not terraforming at all. That's a tough realization, because we hoped that all we had to do was back off and gaia or nature or the ecology would somehow take care of things. It does take care of a lot of things. That's what I call the "natural infrastructure" that civilization is based on, among other things. But we are now such a large force in the world that we have no choice but to figure out how to learn to do the science and the engineering to have our effects in a benign way rather than a malignant way.

Russ: *Your background is in science from Stanford, and you've worked with science over the years. You've written about it in a variety of ways. You clearly have read quite a bit of science; you write about the books that you've read. I knew that you had a connection to Native American and First Nation tribes; I did not realize the extent of it until I read about it in this book. I'm curious to know, aside from the message that you give that we ought to learn from them, but not try and interpret them through our own lens, as an alternative culture. How have those years of engagement with multiple tribes—and being married to an Ottawa mathematician which is a fascinating phrase in itself—influenced how you think about these ecological issues?*

Stewart: Nothing de-romanticizes Indians like real Indians. I got cured of a lot of notions that people have about Indians by hanging out with real folks who are completely amused by white people playing Indian, and avidly reading books about the deep spiritual esoteric practices of various tribes and so on. The tribes do indeed have such practices, but they're not the ones that are in these phony books and sometimes phony movies.

They saved me—I probably would have gone down the path of boy scout wanting to be an old Sioux shaman if I hadn't been headed off by the real folks. But the main practice that I connected with is the Native American Church, the Peyote Church. It is an extraordinary religious/spiritual group and psychological event that is way stronger than any encounter group or anything else. I've been around those and learned a lot from them, but the Peyote meeting is an astonishing piece of work. I'm not telling any secrets, but I write about it because it is pan-Indian—in almost all the tribes, except some of the Pueblo tribes who don't do it, in North America, and seemed to be well-served by it. There's a whole lot of cactus being eaten out there.

Russ: *You mention that the most profound aspect at the Peyote meeting was the showing up of the Peyote woman at the end, and the message she gave. Could you say a little more about what that profound experience was like?*

Stewart: Like everything with Indians, stuff is both profound and comical at the same time. They enjoy that edge; Indian humor never quits. And so the last thing that happened at the Peyote meeting before the final windup by the roadman is that at dawn, one of the women who has been part of the meeting all night has left about an hour earlier. She has gone to get some fresh meat and some fresh fruit. She's bringing in breakfast and is amused at the slavering appetite she sees all around her, because we've all done Peyote all night. We're hungry. We can smell the food, and she's basically saying, "Before you get the food, you have to think about where it comes from." And the answer is, "It comes from me and, by the way, life comes from me." There's a twinkle in her eye. Everybody else at the meeting, I'm sure, heard various versions of this many times. But it was the first time for me.-She's right. All of us people are born of women and all life is born from the Earth. And it started getting pretty deep, and breakfast tasted that much better, I guess.

Russ: *So the connection was there. What is the connection of your experience with Native Americans and your sense of time?*

Stewart: They have continuity with their own history, and they often have sort of a timeless reference to what one may call a mythological frame of thinking about everything that goes on. Both of those are deeper than the usual American-Protestant from-the-Midwest perspective on time. Lo and behold, the last couple of decades I've been working on a 10,000-year clock along with the The Long Now Foundation. Who knows? I may have gotten pushed in that direction at a tender age by hanging out with Indians who had a multi-century perspective on things.

Russ: *I saw the video and slideshow on the 10,000-year clock (http://www.longnow.org/clock/). It was really interesting—the formations in Western Nevada where you were looking to house the clock and the like. Let me share a quotation from you that's related to this question of time—this comes from the Whole Earth Web site, the Long View:*

> I'm interested in events longer than the ego's prison of my lifetime. I'm free to care for other large continuities such as the life of the Earth and the drama of human culture. Previously overwhelming urgencies like the deadline on this book, for me, fall into microcosmic place; worth doing, connected, but not urgent. Religious-scale projects and their comforts have often scourged humankind. I'm thinking of Egyptian pyramids, Muslim jihads, Mongol hoards, Christian crusades, the Third Reich, world communism, maybe science itself. Part of their hazard is that they become their own universe, an infinite regress of self-reference, grounded nowhere.

That's very powerful, Stewart, and I would say very spiritual.

Stewart: And at least partly wrong.
(laughter)

Stewart: I would not put science in that set of categories at all anymore. Some of the rest sounds okay. Boy, do I sound young in that.
(laughter)

Russ: *Well, that's not a bad thing.*

Stewart: Not a bad thing at all.

Russ: *Can you say a bit about the spirit, about how you relate to the notion of spirit, given your very complex, broad-ranging background?*

Stewart: I don't know. The thing I sort of worship lately is weather.

Russ: *We had a beautiful rainstorm here last night.*

Stewart: Yeah, those are wonderful. Spiritual practice, stuff like that all seems good. I don’t actually do any lately. I did some meditation back when I was hanging out with Zen Buddhists in San Francisco. I’m not going to Peyote meetings these days, not going on Vision Quests…those were things that, in their various forms, were very productive for me over a period of time. They’ve stopped being very productive, so I guess I’ve stopped doing them. I honor those kinds of activities and lots of people…well, I’ve seen some fairly spiritual characters become corrupt in their own way. So I know that it’s not a guarantee of right behavior. It certainly helps right behavior in most cases, but it’s not a guarantee. I’ve seen things like yoga move in the direction of this—it’s like a form of pilates for people in a lot of ways now, which is great. But I get my exercise and my stretching from doing other things, like pulling alien-invasive plants out of the ground. So I have great respect and some familiarity with spiritual matters, and it’s not something I’m focused on these days.

Russ: Does it influence your thinking about ecology—the state of the Earth, the environment and the like?

Stewart: No. One thing it has done—I’ve been revisiting Gregory Bateson’s material lately, and his daughter Nora Bateson just made a film about him that I’m in. That was an occasion to look back into some of that material. Gregory had as good a grasp of the value of adding another level when thinking all the time. Whatever level you’re looking at, you’ve got to add a level and then you’ll gain by it. And maybe at some point “one is one and all alone and ever more shall be so.“ That kind of contact through Gregory cured me of a purely engineering approach to life, which I think I was getting somewhat from Buckminster Fuller. So this is a sequence of events back in the sixties and seventies that is very useful to me, or I might have not gotten into the much more many-leveled vein of thinking that they’ve encouraged. And maybe there’s another Bateson out there for me at some point. But not lately.

Russ: Were any of those influences significant in your shift, which I’m assuming this is a shift, from a more hedgehog, shorter term frame of reference to this longer term, seven-generation and more reference to time in the way that you think about how we engage with the Earth and with life?

Stewart: Most of the spiritual reference to long-time is actually the opposite of long-time—stuff like eternity. ~~E~~ternity is the opposite of long-time. Usually when I show up at church for someone else’s funeral, and somebody refers to eternity, they’re always careful to say that it is out of time. You get out of time into eternity, and that’s pretty interesting stuff.

That’s the kind of thing that can make people comfortable with ideas like the Rapture, which I find interesting and comforting for people engaged in activities that are potentially really deleterious. When we talk at the Long Now Foundation, the long now is the last 10,000 years or the next 10,000 years, and we’re really pretty specific about that. Civilization has been gaining ground and becoming more and more civilized and it raises a question: If we’re in the middle of that story, what’s up for the next 10,000 years? You start getting specific and not all vaguing out into eternity. Certain kinds of things happen in centuries; certain kinds of things happen in millennia, and they’re really different. And ten millennia is different than one millennium. That’s useful to bear down on. It’s the kind of thing that lets you see how climate changes play out over that kind of period of time.-If you look at climate in the last 10,000 years in context of climate over the whole of Earth’s history, it’s a very nice, sweet, and potentially very short period of climate stability. Every single bit of this is being extremely specific and practical and noticing the difference between long and longer periods of time. Some people think of long as seven generations. Seven generations, in a way, is like counting to three, and then the next number is many.

Russ: *Why a 10,000-year clock and not a 1,000-year clock, or 5,000 or 20,000?*

Stewart: Because that was actually provided by a professional futurist we work with. His name is Peter Schwartz, and he said, let’s do this in terms of civilization, and civilization basically started with agriculture and then that set in motion a set of sequential events for humans and everything that humans touched. That is, there are many civilizations within that sequence of events that fell~~,~~ but over time, they’ve increasingly known about each other. Retrospectively, we knew about all of them, but the Egyptians did not know about the Incas, and Incas about the Egyptians, but we now know about both. That’s a story that is joined for us, along with all of Chinese history, and so on. So that 10,000-year story suggests symmetry and you can say, “Okay, if we can bear that in mind, let’s bear that same amount of time in mind forward and see what happens.”

Russ: *So basically you build on that by engaging in a form of scenario development, is that right?*

Stewart: Not really. It turns out scenarios are actually quite specifically useless in a 10,000-year time frame.
(laughter)

Stewart: Any form of planning is quite specifically useless within more than about a fifty-year timeframe. But what you can do is multiply options, so that what you’re doing is managing the commons in such a way that humanity has more and more degrees of freedom as time goes by in forms of decades and centuries. It’s actually a thinkable, doable set of projects. It also invites some art forms. So our 10,000-year clock is an art form. All it does is give people permission to think long-term.

Russ: *You mentioned Peter Schwartz and Global Business Network—you’re one of the founders of that with Peter, and others. That leads to asking about the institutional aspect of engaging with the environment, of managing, of leading, of creating and building in a collective fashion. One part of that is your engagement with Jerry Brown. I’d love to hear if you anticipate being involved with him again if he’s elected, which it sounds like he very well might be [He was—Russ]. How do you see these various institutions playing a role? What is needed to use these institutions to further the long view, to engage with the environmental challenges that we’re faced with?*

Stewart: The *Whole Earth Catalog* was kind of Libertarian publication. We were basically saying back at the end of the Kennedy era: Ask not what your country can do for you, do it yourself. *Whole Earth Discipline* is much less focused on individual capabilities and responsibilities than on aggregate ones. Looking at the climate issue, there is basically no way to solve the climate in your backyard. One of the major instruments is going to be governments, because somebody has got to make fossil fuels—especially coal—expensive. Ideally just a straight-forward tax seems to be the simplest. And that must be done by the major greenhouse gas-producing economies—by their governments. Corporations can't make coal expensive. Nonprofits can't make coal expensive. Nor can individuals. People connecting online can't.

It actually takes governments to haul off and say, "Coal is going to be expensive here in China, or here in India, or here in the U.S." And unless and until that happens, we are in deep trouble with our climate. Then suppose the trouble comes along anyway and we have to do geoengineering. It is so cheap to do geoengineering—could be as low as $300M per year basically to get sulfur dust into the stratosphere the way volcanoes do, and we'll cool the planet down by 3ºC. There are thousands of individuals who have that kind of money, but you don't want individuals hauling off and doing that, or individual countries hauling off and doing that. It will take very serious intergovernmental, international agreements to manage geoengineering, including the research for geoengineering. So this is the time, and these are all infrastructural issues, both built infrastructure like our energy systems and natural infrastructure like climate. Managing infrastructure is one of the things that we hire governments to do. So I wind up being the promoter of strong, conscious, careful government.

Russ: And what do you see as the potential for that being realized?

Stewart: Uncertain. The outcome of the situation we're facing this century is that we don't know yet.

Russ: Well, thank you so much. I really appreciate you taking the time for this conversation, Stewart.

Stewart: Thank you, Russ.

The Meaning-making of Dag Hammarskjöld

Kristian Stålne[1]

Abstract: Dag Hammarskjöld, United Nations' second Secretary-General 1954-1961, is getting recent attention for two reasons: he is going to front the new Swedish 1000-kronor note, the highest value; and this September it was 50 years since he was killed in an airplane crash in UN service in Congo. With that event, the most successful career in an international service that a Swede has ever had was terminated prematurely, a service that would set an unmistakable imprint on the UN organization as well as on the world stage of politics. But what made Dag Hammarskjöld such an exceptional leader and how did he view the world and his role in it? He was not only exceptional as a leader and world-centric visionary; he was also a mystic and an aesthetician with a highly analytic mind. What is unique is the fact that large parts of his thinking and personal struggling are available to the world through a dense material of his speeches and personal writings. This has made it possible to analyse the stages of development represented in them. Using ego development theory, described by Jane Loevinger as well as Robert Kegan, I offer the analysis that his writings, including during his most severe personal crisis, indicate he passed through a transition between the *individualist* and *autonomous* stages.

Keywords: Adult development, autonomous, Dag Hammarskjöld, ego development theory, individualist, meaning making, stages.

Biography

Dag Hammarskjöld was borne in Jönköping in Sweden 1905 but grew up in Uppsala where he studied language, philosophy, and above all national economy in which he wrote his doctoral dissertation in 1933. His father, Hjalmar Hammarskjöld, made a career in the Swedish state bureaucracy and was Sweden's Prime minister in 1914-1917. With him, Dag early came in contact with the nation's intellectual elite, and made a quick career in different positions within the National bank, the Department of finance and as a Swedish delegate within OEEC (Organization for European Economic Cooperation, today OECD), as secretary of the Cabinet within the Foreign state department and as a minister in Tage Erlander's Social democratic government 1951-1953 – despite the fact that he was not a member of the party. In 1953 he was elected into the Swedish academy replacing his father after his death (Urquhart, 1972).

SOME RIGHTS RESERVED

In 1952, the UN's first Secretary-General, the Norwegian Tryggve Lie, resigned after have been in conflict with the Soviet Union that declared him non-existing. After many turns Dag Hammarskjöld was introduced as a candidate that all could agree on for many reasons. First, he had shown his skills as a negotiator and diplomat within the OEEC; second, he could speak French which the French always had as a demand for candidates to Secretary-General; third, he came from neutral Sweden and appeared as a very neutral person in general – an intellectual and skilful bureaucrat that could organize the dysfunctional secretariat; and finally and most important, accomplishing such challenges without making too much noise and in any way challenge the superpowers. Dag Hammarskjöld was nominated and offered the position as Secretary-General on April 1st, 1953, accepted, and swore the oath on April 10th. He was welcomed to New York the day before by Tryggve Lie with the less than encouraging words: "You are taking over the world's most impossible job."

Dag Hammarskjöld 1959. Photo: UN/DPI

Hammarskjöld started by restructuring the entire UN from within and reorganized the secretariat before he started to give his own imprint on the scene of world politics, foremost by his signum, the quiet diplomacy and his ability to establish mutual trust with different parties that were being locked in fixed positions. He succeeded with negotiating the release of several

American UN-flyers from China and thereafter with mediating between Egypt and Israel in the Suez crisis. He was unanimously re-elected in 1957 to a second five-year period as the Secretary-General.

Chaos erupted in Congo in 1960 after independence from Belgium, and Dag Hammarskjöld created a peacekeeping force to try to establish some order. Congo still remained his major headache, under severe pressure from the Soviet Union. He decided to resign if he would fail to solve the problem in a satisfactory way, and set out on his travel there. During a flight from Leopoldville in Congo to Ndola in the present Zaire for a negotiating session the night between the 17th and 18th of September, 1961, the plane crashed for yet today unknown reasons and all 16 passengers including Dag Hammarskjöld was killed. He was awarded a posthumous Nobel Peace Prize later that year for his efforts "to bring peace and goodwill among nations and people."

Dag Hammarskjöld was, as evident in his statements and actions, an exceptional man, but what makes him even more fascinating is that he at his death left behind his very personal diary entries from most of his life, which gives us a glimpse of his inside. These entries have the form of short text passages, aphorisms, and haiku poems which express his innermost uncensored thoughts, reflections, doubts, and sometimes even despair. The entries are in chronological order with the specified year, sometimes even dates. The notes were found in his apartment after his death with the following instructions to the cabinet secretary, Leif Belfrage.

> Dear Leif,
> Perhaps you may remember I once told you that, in spite of everything, I kept a diary which I wanted you to take charge of someday.
> Here it is.
> It was begun without a thought of anybody else reading it. But, what with my later history and all that has been said and written about me, the situation has changed. These entries provide the only "profile" that can be drawn. That is why, during recent years, I have reckoned with the possibility of publication, though I have continued to write for myself, not for the public.
> If you find them worth publishing, you may have my permission to do so—as a sort of white book concerning my negotiations with myself—and with God.
> Dag

The notes were published posthumously in unedited form under the title "Markings" (Hammarskjöld, 1964), which has become a classic and rests on many UN officials' bookshelves. This amazing insight into the interior of one of the greatest leaders of all time makes it possible to make an analysis from an adult development perspective. Here Dag Hammarskjöld's meaning-making, i.e., the assumptions that constitute and thereby determine how he organises reality, will be described and analysed with respect to ego development according to Jane Loevinger (Hy & Loevinger, 1996) and Robert Kegan (1982; 1994).

The sources of this analysis are his own diary entries of Markings, Mats Svegfors' biography "Dag Hammarskjöld – den förste moderne svensken" (Svegfors, 2005), Kai Falkman's "To speak for the world" (Falkman, 2005) which is a compilation of Dag Hammarskjöld's speeches as the Secretary-General, and Brian Urquhart's biography "Hammarskjöld" (Urquhart, 1972).

The Crisis

The primary source to analyse the meaning-making of Dag Hammarskjöld in the pre-UN part of his life comes from Markings. As a person he was often described as a withdrawn and rigid person with a high degree of self-discipline and perfectionism. His performances were not particularly charismatic, unlike his predecessor, Trygve Lie, and he often read his speeches monotonously, straight from the script that he usually wrote himself. In Markings he is, however, completely honest and reveals an existential depth and sometimes even darkness, despite all external success.

> These wretched attempts to make an experience apprehensible (for my sake? For others?)–the tasks of the morrow–Y's friendship or X's appreciation of what I have done: paper screens which I place between myself and the void to prevent my gaze from losing itself in the infinity of time and space.
> Small paper screens. Blown to shreds by the first puff of wind, catching fire from the tiniest spark. Lovingly looked after– but frequently changed.
> This dizziness in the face of *les espaces infinis*–only overcome if we dare to gaze into them without any protection. And accept them as the reality before which we must justify our existence. For this is the truth we must reach to live, that everything *is* and we just in it. (Hammarskjöld, 1964, pp. 40-41)

A recurring theme in the pre-UN time is the existential and spiritual quest inward and the loneliness that follows. Although Dag Hammarskjöld was always a believing Christian, God appears only sporadically in the first part.

> The longest journey
> Is the journey inwards.
> Of him who has chosen his destiny,
> Who has started upon his quest
> For the source of his being
> (Is there a source?).
> He is still you,
> But without relation,
> Isolated in your feeling
> Like one condemned to death
> Or one whom imminent farewell
> Prematurely dedicates
> To the loneliness which is the final lot of all.
>
> Between you and him is distance,
> Uncertainty–
> Care.
>
> He will see you withdrawing,
> Further and further,
> Hear your voices fading,

Fainter and fainter.
(Hammarskjöld, 1964, p. 48)

This is very typical for a person at the individualist stage, seeing through the shallowness of existence and following his own path and looking inward. The political neutrality when he entered the Tage Erlander government in 1950 was also a hallmark of an individualist: he wanted to remain outside the group and the Social Democratic Party, viewed himself primarily as a servant of the people which was also difficult enough to want to have this formalized before the king.

Mats Svegfors called the notes from 1950-1952 (Hammarskjöld, 1964, pp. 28-73) the "the crisis years" (Svegfors, 2005, p. 97) and it seems here as if Dag Hammarskjöld penetrates deeper and deeper into the darkness whereas a question or theme emerges, the quest for meaning or purpose in life.

> Give me something to die for –!
>
> The walls stand
> Speechless and cold, the banners
> Faffle in the wind. (Hölderlin)
>
> What makes loneliness an anguish
> Is not that I have no one to share my burden,
> But this:
> I have only my own burden to bear. (Hammarskjöld, 1964, p. 71)
>
> Pray that your loneliness may spur you into finding something to live for, great enough to die for. (Hammarskjöld, 1964, p. 72)
>
> What I ask for is absurd: for life to have a meaning.
> What I strive for is impossible: that my life shall acquire a meaning.
> I dare not believe, I do not see how I shall ever be able to believe: that I am not alone. (Hammarskjöld, 1964, p. 72)
>
> Is the bleakness of this world of mine a reflection of my poverty or my honesty, a symptom of weakness or of strength, an indication that I have strayed from my path, or that I am following it? – Will despair provide the answer? (Hammarskjöld, 1964, p. 72)

The loneliness is striking, but that is not the biggest source of his despair and existential angst. He seeks not primarily someone who can share his burden, but rather, he seeks someone else's burden that *he* can carry, something he could die for. He wants to serve but has no clear image of what to serve. Here is the downside of the individualist stage, it has made its way out of the immediate struggle for survival, from authority, ideologies and -isms and there is no longer any great cause that one is prepared to die for. But the disadvantage is precisely that, if there is nothing worth dying for, there is really nothing to live for. There is the fundamental cause of Dag Hammarskjöld's existential crisis, and the downside of the meaning-making of the individualist stage.

In this mode, one could guess that an offer of a position as Secretary-General showed up and changed everything, but that was not how it came down. In an existential search such as this it is easy to search for an external challenge, and that the right cause to die for appears out in the world. But what marks a further shift from the individualistic stage is in fact something that happens on the inside, although in some other cases it may be triggered by external events. This shift can be noted in the first quotation from 1953, that Svegfors (2005, p. 110) calls the "dramatic turnaround."

> – Night is drawing nigh –
> For all that has been – Thanks!
> To all that shall be – Yes!
> (Hammarskjöld, 1964, p. 74)

What is important to keep in mind here is that this and the next notes that have a different, lighter tone than previous written before Dag Hammarskjöld is considered for the Secretary-General position. Svegfors writes:

> His crisis was conditioned by a kind of career futility. He had become everything he could reasonably be in the Swedish civil service. But it gave him no answer to the question of the meaning of his life. He turned inward and away from the big stage of public life and he found the answer. But once this had happened there occurred an entirely improbable peripeteia in his life. He was summoned to the office as Secretary-General of the United Nations. (Svegfors, 2005, p. 130)

The Spirituality

After the turning point in Dag Hammarskjöld's life, his meaning-making can best be described by addressing the different domains of his life, or psyche, one at a time. And it seems most appropriate to start with the spiritual side. Even if Dag Hammarskjöld was a believing Christian, it appears in his notes as if God did not join him at his trip downwards. But the first note after the turning point, i.e., the second entry in 1953, reads as follows:

> It *did* come – the day when grief became small. For what had befallen me and seemed so hard to bear became insignificant in the light of the demands which God was now making. But how difficult it is to feel that this was also, and for that very reason, the day when the Joy became great. (Hammarskjöld, 1964, p. 75)

Here it appears as if God is back in the picture, partly in the description of the psychological burdens as something that had meaning, in that it was subordinated to something that was greater, the requirements God placed. But how did God come into the picture of Dag Hammarskjöld? The next note is the book's shortest but probably the most succinct:

> Not I, but God in me. (Hammarskjöld, 1964, p. 75)

God was not with him on the journey down, but awaited him at the bottom. Believers and non-believers make meaning at different stages. And after submitting the most fundamental piece of the puzzle, the keystone, pieces fall into place and Dag Hammarskjöld makes the transition from the individualist stage to the autonomous stage of ego development, or meaning-making. His faith in God is usually described as very complicated; you could say that it is a post-conventional type of Christian mysticism. A few years later he quotes Rumi, a classic Persian mystic from the 1200s.

> The lovers of God have no religion but God alone. (Hammarskjöld, 1964, p. 86)

This is post-conventional in the sense that they both seek a direct personal relationship with God instead of going through a religious community or congregation, and also to seek God within himself, which many mainstream believers would regard as direct blasphemy or hubris. Mystics are often in conflict with the more traditional supporters, and especially by the respective fundamentalists, regardless of religion. They often find greater fellowship and inspiration from mystics of other religions than from the conventional elements of their own: “A theme of many critics was that Hammarskjöld would have identified with Christ, not just trying to work in his imitation. Dag Hammarskjöld would have suffered an unprecedented hubris” (Svegfors, 2005, p. 146).

One can understand that Dag Hammarskjöld was not completely open about his faith during his lifetime. And many post-conventional leaders can get into trouble being completely transparent about their beliefs, because they can be easily attacked by the mainstream.

> I am the vessel. The draught is God’s. And God is the thirsty one. (Hammarskjöld, 1964, p. 76)

The first thing is to empty the vessel from all psychological material, stripped and deconstructed of the personality of an individualist. Then you can fill it, the integration of an autonomous ego. Looking back at his journey, Dag Hammarskjöld expresses it in the following manner in a radio performance from 1954, entitled “Old beliefs in a new world” (Falkman, 2005, pp. 57-58)

> The world in which I grew up was dominated by principles and ideals of a time far from ours and, as it may seem, far removed from the problems facing a man of the twentieth century. However, my way has not meant a departure from those ideals. On the contrary, I have been led to an understanding of their validity also for our world today. Thus, a never abandoned effort frankly and squarely to build up a personal belief in the light of experience and honest thinking has led me in a circle; I now recognize and endorse, unreservedly, those very beliefs which were once handed down to me.
>
> From generations of soldiers and government officials on my father’s side I inherited a belief that no life was more satisfactory than one of selfless service to your country – or humanity. This service required a sacrifice of all personal interests, but likewise the courage to stand up unflinchingly for your convictions.

> From scholars and clergymen on my mother's side I inherited a belief that, in the very radical sense of the Gospels, all men were equals as children of God, and should be met and treated by us as our masters in God.
>
> Faith is a state of the mind and the soul. In this sense we can understand the words of the Spanish mystic, St. John of the Cross; "Faith is the union of God with the soul." The language of religion is a set of formulas which register a basic spiritual experience. It must not be regarded as describing, in terms to be defined by philosophy, the reality which is accessible to our senses and which we can analyse with the tools of logic. I was late in understanding what this meant. When I finally reached that point, the beliefs in which I was once brought up and which, in fact, had given my life direction even while my intellect still challenged their validity, were recognized by me as mine in their own right and by my free choice. I feel that I can endorse those convictions without any compromise with the demands of that intellectual honesty which is the very key to maturity of mind.

At the autonomous stage the cognitive capacity is available to distinguish between different internal domains such as spiritual experiences with its descriptions and the philosophical description of the mind's experience of reality, which we may describe as phenomenology and empiricism. A critical and honest intellect is an asset as long as it knows its limitations.

The Ethics

Another example of the cognitive capacity at the autonomous stage is the ability to distinguish, separate, and even combine, ethics with aesthetics. And it is the ethics that get the most room in Dag Hammarskjöld's life and as he describes his ethics in terms of meaningfulness in a new way:

> You will know Life and be acknowledged by it according to your degree of transparency, your capacity, that is, to vanish as an end, and remain purely as a means. (Hammarskjöld, 1964, p. 134)

Meaningfulness is thus to put self-interest entirely aside and see oneself solely as a means to something greater. If this goal is truly greater than oneself, then one's own suffering will be easy to endure. Meaningfulness is thus self-chosen self-sacrifice for a greater cause. But what is greater? What is to be accomplished, he himself is the means but what is the goal?

The goal is usually not about to foist on others his own God or his own doctrine since autonomous persons have great respect for others' autonomy, hence the name of the stage. We can find some answers in one of his speeches in which he articulates what is worth dying for. The following speech was made for the UN correspondents' luncheon for the Secretary-General April 9, 1958, which begins with a poem:

> The past is always with us and to the coming
> days we are those who carry the past centuries
> and also our own few days.
> (Gunnar Mascoll Silverstolpe, 1893-1942)

> This poem is written by a close friend of mine who is now dead. I think that is really the way we must look at all our various efforts in the realm of international peace, of the movement towards a world of order and justice.
>
> We have back of us the responsibility created by, in fact, centuries of development. We have in front of us millennia. And in between those centuries and those millennia there are a few years which we might measure in days and weeks and years and five-year terms of office of the Secretary-General, if I look at it from my angle, and those days are really nothing in comparison to what is back of us, and what is in front of us. But they get their sense from what is back of us, and they get their sense in what they mean for the future; that is to say, what we can hand over after our time of work is not just what we have managed to add to the heritage, it is the whole heritage with the little we have managed to add.
>
> It is a confession to a kind of conservatism, a confession to a belief in the continuity of human history, of the history of society, of the history of human endeavour in a sound direction. I cannot belong to or join those who believe in our movement towards catastrophe. I believe in growth, a growth to which we have a responsibility to add our few fractions of an inch.
>
> It is not the facile faith of generations before us, who thought that everything was arranged for the best in the best of worlds or that physical and psychological development necessarily worked out towards something they called progress. It is in a sense a much harder belief – the belief and the faith that the future will be all right because there will always be enough people to fight for a decent future.
>
> I do not think that there is anything automatic with progress. I do not think that there is anything we get for nothing in success. But I do believe firmly that here in this room, around this Organization, in this city, in this country, in this world, there are enough people who are solidly engaged in this fight and who are strong enough and dedicated enough to guarantee its success. It is in a sense a switch from the atmosphere of pre-1914 to what I believe is the atmosphere of our generation in this time – a switch from the, so to say, mechanical optimism of previous generations to what I might call the fighting optimism of this present generation. We have learned it the hard way, and we will certainly have to learn it again and again and again… (Falkman, 2006, pp. 52-54

From this talk, we learn that the highest good that Dag Hammarskjöld is prepared to die for is the development of humanity in a healthy direction of peace and order, and it is up to us to take responsibility for ensuring that things are moving in the right direction. We also get an idea of the time span he takes into consideration, many generations back and forth. And we add as our small contribution the little time we have at our disposal.

When Dag Hammarskjöld was appointed Secretary-General he began to manage what he was supposed to do, namely to bring order to the United Nations and he did it from the inside out. First order within himself, then order in the Secretariat before UN and himself could act with power on the world stage. But it was not only the organizational structures he changed. With speeches such as the one above, he created a culture where the international service was in the centre, a culture that still lives and breathes in the United Nations organization and its officers, regardless of its current leadership.

Another aspect of personal development is the ability to take responsibility, first for oneself, then for one's group or nation and eventually the whole world: egocentric, ethnocentric and finally world-centric. One's identification and care can extend and embrace more and more without any contradiction or conflict between the different levels since you yourself are part of the group or nation, which in turn is part of the whole of humanity, something Dag Hammarskjöld describes when he expresses the international service ("service" of course comes from "to serve"):

> The question is not either the nation or the world. It is, rather, how to serve the world by service to our nation, and how to serve the nation by service to the world. (Falkman, 2005, p. 138)

It is thus possible to serve for the UN while in the same time serving his country, a dialectical argument. What is good for the United Nations is good for all constituent countries and all individuals. Similarly, he recognizes that the UN's most fundamental problem is that the organization has no formal power, none of the more influential member nations wanted to voluntarily relinquish power and would prefer a UN that isn't too inconvenient. For them it is either our best or the UN's top. His words from 1957 are relevant today:

> The United Nations finds itself in a difficult stage of its development. It is still too weak to provide the security desired by all, while being strong enough and alive enough effectively to point out the direction in which the solution must be sought. In its present phase the Organization may look to many like a preacher who cannot impose the law he states or realize the gospel he interprets.
>
> It is easy to say that it is pointless to state the law if it cannot be enforced. However, to do so is to forget that if the law is the inescapable law of the future, it would be treason to the future not to state the law simply because of the difficulties of the present. Indeed, how could it ever become a living reality if those who are responsible for its development were to succumb to the immediate difficulties arising when it is still a revolutionary element of the life of society? (Falkman, 2005, pp. 69-70)

Although the UN has no formal powers, it can still exert influence by providing a global moral compass and point the way toward the future, a future that it is in everyone's interest to reach. And with Dag Hammarskjöld at the helm there is no doubt about the direction. Today you would say that the UN has a major influence in the form of the strong brand that Dag Hammarskjöld helped to build and that Ban Ki-moon now is draining (Ekdal and Ahlenius, 2011), even though the entire blame of course cannot be laid on him.

The Intellect

Dag Hammarskjöld was brought up in Sweden's intellectual elite. He received his Ph.D. at age 28, quickly made a career as an officer and became known for his intellectual sharpness. He was elected to the Swedish Academy, spoke fluent English, French, and German, and was at the time of his death engaged in the translation of Martin Buber's "Ich und Du."

The human progress that he builds his ethics on is described in terms of an institutional evolution in a speech at the University of Chicago 1960.

> Men organize themselves into families. The families join together in villages or tribes. The tribes and the villages fuse into peoples, and one day, out of the self-consciousness of a people, there develops a feeling of difference and separateness, the positive expression of which is a feeling of nationhood. The nation organizes its life within a set of constitutional rules, evolving in practice or crystallized as law. Under the constitution the people develop national organs with different functions and a division of responsibilities representing a balance of power. Through those organs laws are given, setting the pattern for the lives and activities of the individuals and the groups which constitute the nation. (Falkman, 2005, pp. 158-159)

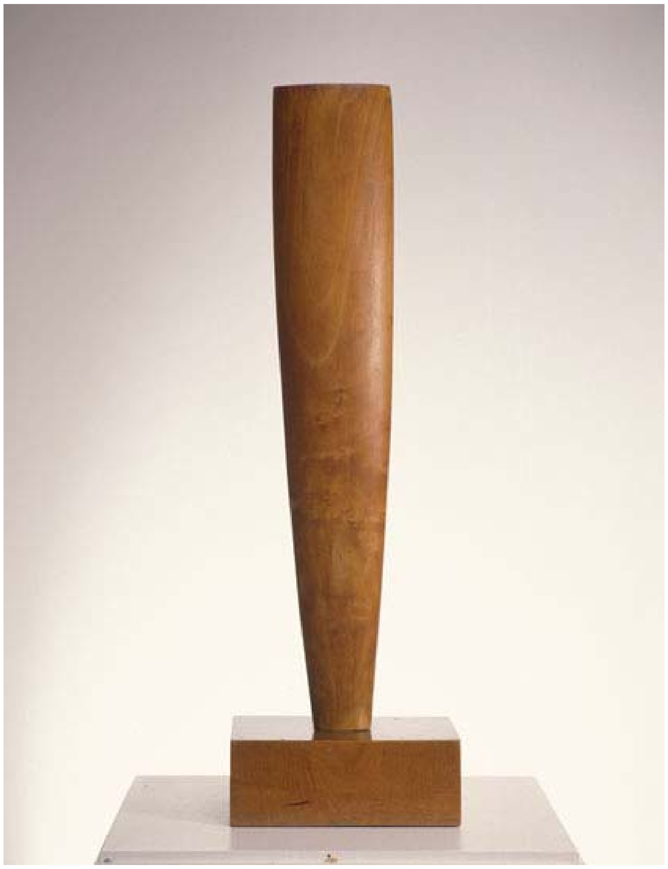
Here, Dag Hammarskjöld demonstrates an evolutionary view of law, institutions and, although expressed vaguely, consciousness.

> I believe it is useful, in the discussion of the development of human society, be it national or international, to keep in mind this sociological perspective taken over from theories of biological evolution. (Falkman, 2005, p. 160)

The fact that he employs the evolutionary theory from biology on sociology is a sign of a very high cognitive capacity and complex thinking. Coordinating evolutionary patterns in diverse disciplines is at least metasystematic according to hierarchical complexity theory (Commons, 2008; Commons, Miller, Goodheart, Danaher-Gilpin, 2005; Commons & Goodheart, 2008). Had adult development theories been available to him at that time he would certainly had been able to weave them into the analysis.

The Aesthetics

Another reason for Dag Hammarskjöld's described loneliness was that he never lived in any partner relationship, he remained single throughout his whole life. He had, however, a deep friendship with the British artist Barbara Hepworth, which began when he took a liking to her artwork single form of sandalwood (Fröhlich, 2001).



Barbara Hepworth, *Single Form*. © Bowness, Hepworth Estate.
Reproduced with permission.

She offered it to him as a gift and he kept it in his office and wrote about the artwork in Markings:

SINGLE FORM
The breaking wave,
And the muscle as it contracts
Obey the same law.

An austere line
Gathers the body's play of strength
In a bold balance.

Shall my soul meet
This curve, as a bend in the road
On her way to form?
(Hammarskjöld, 1964, p. 148)

After this meeting followed a long correspondence that lasted until his death. It was not just the ethics, the international service, that defined Dag Hammarskjöld; aesthetics were also a central aspect. Also this is a dialectical approach, not to be swayed by just one or the other but to see how the two are mutually supportive as evidenced in a speech at the Museum of Modern Art in New York:

> In modern international politics – aiming toward that world of order which now more than ever seems to be the only alternative to disruption and disaster – we have to approach our task in the spirit which animates the modern artist. We have to tackle our problems without the armour of inherited convictions or set formulas, but only with our bare hands and all the honesty we can muster. And we have to do so with an unbreakable will to master the inert matter of patterns created by history and sociological conditions. (Fröhlich, 2001, pp. 18-19)

Here, he draws parallels between the ethics of politics and the aesthetics of the artist. In both cases it can be described as man moving from chaos to creation order, in the form of an artwork or a calmer and more peaceful world. In Markings, he draws on a parallel between the artwork and the artist:

> A poem is like a deed in that it is to be judged as a manifestation of the personality of its maker. This in no way ignores the beauty as measured by aesthetic standards of perfection, but also considers its authenticity as measured by its congruence with an inner life. (Hammarskjöld, 1964, p. 109)

All are thus interconnected, what you do in the world, whether it is about creating a work of art or an act as an international service, is a manifestation of who you are inside you. And in the correspondence and relationship with Barbara Hepworth, one can say that Dag Hammarskjöld became whole on many levels. From Kaj Falkman's introduction to "To speak for the world":

> The correspondence shows that the Barbara Hepworth broke through Dag Hammarskjöld's emotional isolation. Thereby she integrated him also emotionally with the unity with the universe that he intellectually and morally had already incorporated into his personality. Hammarskjöld's first impression of the "Single Form," he writes in the above mentioned letter in October 1960 "is not only one of great beauty but also by a heightened sense of drama in the ongoing struggle between subhuman chaos and human creation order." (Falkman, 2005, p. 49)

The Synthesis – The Big Three

In this evolutionary context a triad of values that are sometimes referred to is "the big three", a division of the three spheres of ethics, aesthetics and science, or "beauty," "goodness" and ”truth“, as Plato called them (Wilber, 1995). The three are kept separate where no one may be subordinated to anyone else. And if one would summarize Dag Hammarskjöld's personality one could say that it comprises of an integration of these big three: scientific clarity and intellect, along with a sense of aesthetics and an ethics, which means a total dedication to international service. A psychology where three such systems or value spheres can live side by side would, according to Robert Kegan's Subject-object theory, can be described as trans-system, i.e., 5th order consciousness, which corresponds to the autonomous stage according to Jane Loevinger's ego development theory (Kegan, 1982).

Dag Hammarskjöld can be said to be ahead of his time, but even today it is not easy to find leaders with similar characteristics – although we now have the tools to evaluate stages of meaning-making or ego development. It is not possible to write a management book filled with tips and checklists on how to acquire these properties. Nor can it be taught in a workshop.

The last word goes to Dag Hammarskjöld, who nevertheless makes an attempt to describe how to cultivate what he means by a spiritual maturity and leadership that has made such an impression on the world.

> *Respect for the word* is the first commandment in the discipline by which a man can be educated to maturity – intellectual, emotional, and moral.
>
> Respect for the word – to employ it with scrupulous care and an incorruptible heartfelt love of truth – is essential if there is to be any growth in a society or in the human race.
>
> To misuse the word is to show contempt for man. It undermines the bridges and poisons the wells. It causes Man to regress down the long path of his evolution.
>
> But I say unto you, that every idle word that men speak… (Hammarskjöld, 1964, p. 94)

Learning From the Unfathomable: An Analysis of Anders Behring Breivik

Pelle Billing[1] and Kristian Stålne[2]

Abstract: The Norwegian mass murderer Anders Behring Breivik and his manifesto are analyzed from different perspectives by employing various models from the field of adult development psychology; we analyze Breivik and the movement he claims to represent with respect to hierarchical complexity, ego development theory according to Jane Loevinger and Robert Kegan, and value systems according to Clare W Graves. The specific values of the Scandinavian culture in which Breivik was raised – and that he wanted to attack – are also analyzed in order to understand this terrible deed. We conclude that Breivik can be regarded as a complex thinker who is also fairly mature from an ego development perspective, and his terrorist act can be seen as traditional values attacking the postmodern values that dominate in Scandinavia. With regard to motive we argue that his attack was fueled by a fragile gender identity due to paternal abandonment issues and a less than male friendly culture. This fragile gender identity then latched onto double standards in the intersection of gender politics and multiculturalism. We also argue that while the deed itself was hideous and repulsive, these double standards need to be exposed and addressed.

Keywords: Anders Behring Breivik, ego development theory, gender identity, gender politics, model of hierarchical complexity, multiculturalism, Spiral Dynamics.

Introduction

On July 22nd 2011, Norway and perhaps also Europe witnessed its worst terrorist attack in modern times, when Anders Behring Breivik detonated a homemade bomb next to a government building in central Oslo, and then continued directly to the island of Utöya to open fire at a youth camp. The bomb in central Oslo resulted in eight casualties and the ensuing mass shooting killed 69 persons, mostly teenagers. As it turns out, the gathering on the island was the summer camp of the Workers' Youth League – a social democratic group for young people. (Wikipedia, 2011)

SOME RIGHTS RESERVED

Just before the terrorist attack, Breivik published a 1500-page manifesto on the web (Breivik, 2011) where he gave his reasons for the actions as well as his view on the world and on himself. Consequently, he can be regarded as not only one of the worst but also the best-documented, mass murderer ever. This readily available material gives us an opportunity to draw some conclusions about what happened, why it happened, and if it may happen again. We also consider it essential to look at the material from a developmental perspective.

Some pundits may argue that Breivik is either mentally disturbed or just plain evil, and that trying to understand him or trying to find a logic in his actions is somehow the same as excusing him. This is not the case. We fully condemn the attacks – and have been profoundly affected by them as human beings and Scandinavians – but analyzing and understanding them is a must, if we are to learn from them.

In this paper we analyze the Breivik attack from different angles. First, we take a look at the manifesto and the core message he wants to transmit to the world, as well as the movement and ideology he regards as his affiliation. This ideological cluster is analyzed with respect to value system according to the work of Clare W Graves, and its relationship to the Scandinavian culture is determined. Then we take a look at Breivik himself and evaluate his mental abilities from a developmental perspective with respect to ego development theory according to Robert Kegan, and with respect to cognitive capability according to the model of hierarchical complexity. Finally, we take a look at Breivik's life and experiences in order to find some answers to what made him a mass murderer. We argue that a perfect storm of personal traumas and cultural double standards greatly contributed to the terrorist act.

Important to note is that this horrible tragedy has already been the source of several political and psychological analyses. The analysis performed here is by no means complete and to some extent speculative, but it adds a developmental perspective – as well as a plausible explanation with regard to deep motive – which we haven't come across thus far.

Values of the Political Movement Described in the Manifesto

The most common interpretation of the attack and the message in the manifesto is that it is an attack from the extreme right; namely, "cultural conservatism." Although this is not an incorrect way of putting it, there is a lack of depth in such an interpretation. In order to analyze the message and values of the manifesto with respect to the vertical dimension, the Spiral Dynamics model for value systems (based on the work of Clare W. Graves) is employed (Beck and Cowan, 2006).

According to Graves, values typically occur in systems called value memes, which are coherent sets or clusters of values. These values are a consequence of the person's worldview and a response to the perceived problems. Graves identified eight different value systems that describe how humans as well as cultures evolve. In most western cultures, such as the Scandinavian, it is sufficient to describe three value systems and the colors used to symbolize them, in order to capture the majority of influence:

Traditional values, or TruthForce (Blue): Traditional values are characterised by conformity, conservatism, often with Christian and nationalistic views. There is a clear view of truth – normally dictated by an authority, sometimes fundamentalist – which gives a clear sense of purpose in life. There is an emphasis on clear borders between different cultures and between the two genders.

Modern values, or StriveDrive (Orange): Modern values arose in Europe in tandem with the scientific and industrial revolution. They emphasize a scientific view of the world that argues for the rational individual. The modern value system is typically positive towards the future and acknowledges the value of scientific progress and economic growth.

Postmodern values, or HumanBond (Green): As a reaction to the modern values there was a breakthrough of postmodern values in the 1960s with the environmental movement, the peace movement, feminism, the human rights movement, and multiculturalism. Although they may not be as coherent as the previous value systems, postmodern values are said to emphasize human relations and tolerance for different cultures, races, and sexual orientations.

Although in a minority worldwide, the postmodern values can be said to be the dominant and agenda-setting value system in the political and media spheres of Scandinavia. However, in the Scandinavian middle class the picture is more muddled, with modern values likely in majority. Some would also argue that there are significant pockets of traditional values in the middle class, in contrast to the lip service being paid to postmodern values.

The core message in Breivik’s manifesto – what he refers to as “cultural conservatism” – is equivalent to traditional values, emphasizing nationalism, safety, and a return to the gender roles of the 1950s when, according to Breivik, “...most men treated women like ladies, and most ladies devoted their time and effort to making good homes, rearing their children well and helping their communities through volunteer work.” (p. 12) According to him and the movement he is part of, these values are crucial as a counter force to the (also traditionalist) Islamic jihad movement that in their view is threatening to invade Europe.

Breivik’s manifesto mainly attacks what he refers to as “cultural Marxism” or “political correctness” that is a very close approximation of the postmodern value system. These entities emphasize values such as tolerance, diversity, multiculturalism, feminism, and deconstruction of the traditional Christian values, as he describes in a quote in the next section. The manifesto, as well as his own terrorist attack, can therefore be seen as the traditional value system attacking the postmodern value system (or in Breivik’s mind, defending itself from the postmodern value system). In other words, we are talking about a “Blue” attack on “Green.”

The explanation given for the attack on the postmodern value system is that it is said to weaken Europe with its deconstruction of the European Christian identity and its emphasis on multiculturalism and feminism, as opposed to nationalism and patriarchy. In Breivik’s view, the cultural Marxism of Eastern Europe has successfully infiltrated and weakened the Western European identity. He fails to understand that those values of tolerance and multiculturalism actually evolved out of the traditional and modern values present in his own country.

The targets were selected to strike at the core of what Breivik considers to be the “cultural Marxist” movement while simultaneously maximizing terror and media attention; therefore he chose to strike at a government building (of the reigning Social Democrats) and a youth camp of Social Democrats and Democratic Socialists. However, the question of how a person with traditional values was capable of planning and performing this cruel and cold-blooded deed still remains. We now turn to Breivik himself in order to evaluate his cognitive capacities.

Breivik’s Cognitive Abilities

Can Breivik be regarded as an intelligent individual or is his deed simply a random attack of insanity? We can attempt to answer this question by looking at excerpts from Breivik’s manifesto and evaluating the stage of performance in hierarchical complexity terms according to the model of hierarchical complexity (Commons, 2008; Commons & Ross, 2008) and its hierarchical complexity scoring system (Commons, Miller, Goodheart, & Danaher-Gilpin, 2005). Such a process gives us a good approximation of Breivik’s cognitive performance.

The stage of complexity is a product of the structure of what is being written, not the actual content. In other words, a person may be fully capable of quite complex reasoning even if the content is deeply problematic or even repulsive. While impossible to analyze all 1500 pages of the Breivik manifesto – a text that was largely cut and pasted from the Internet and written by Breivik’s idol Fjordman – it is quite possible to find passages representative of Breivik’s own writing. Here he dialogues with himself:

> Q: Some will claim that you are Christian fanatics, just as hateful and intolerant as Al Qaeda. How would you react to accusations like that?
> A: The PCCTS, Knights Templar is a European indigenous rights movement and a Crusader movement (anti-Jihad movement), a part of the pan-European and national resistance movement. In a way it is a conservative revolutionary movement.
> By propagating and defending Christendom we simply mean that we want to halt the cultural Marxist/multiculturalist attacks and systematic deconstruction on our Christian cultures and the Church itself and to reverse the de-Christianisation of Europe. The biggest threat to Europe is the cultural Marxist/multiculturalist political doctrine of ”extreme egalitarian emotionalism”. This type of political stance involves destroying Christendom, the Church, our European cultures and identities and opening up our borders to Islamic colonisation. The Islamisation of Europe is merely a “secondary infection.” Western Europe has grown weak and decadent and will be completely annihilated culturally unless we succeed to implement a second European renaissance and reverse the damage done. (pp. 1352-1353)

This is a typical example from the text where Breivik explains his ideological affiliation and mission. He contrasts what he calls the Marxist/multiculturalist ideology with his own conservative revolutionary movement. By contrasting and comparing the ideologies, which are richly elaborated throughout the more than 1500 pages, his writings demonstrate a metasystematic view on what he describes as the two ideologies. This estimation is further reinforced by the following quote, which gives an accurate description of the characteristics of an ideology, although he fails to recognize that he promotes one himself:

> One of conservatism’s most important insights is that all ideologies are wrong. Ideology takes an intellectual system, a product of one or more philosophers, and says, “This system must be true.” Inevitably, reality ends up contradicting the system, usually on a growing number of points. But the ideology, by its nature, cannot adjust to reality; to do so would be to abandon the system. (p. 11)

One could, however, argue that the words are still not entirely his own. Large parts of the text come from other sources that he has been either influenced by or simply copied and pasted into the document. One such source is Breivik’s own source of inspiration, the Norwegian blogger Fjordman. But understanding Fjordman’s arguments on ideology and explaining them correctly corresponds to a level of support of -1 (Commons & Goodheart, 2008), meaning that Breivik’s cognitive capacity in terms of hierarchical complexity can be estimated to be at least at the systematic stage in this domain, i.e., one stage lower than metasystematic, which still is probably higher than the average Scandinavian.

Ego Development

The rich personal material available allows us to analyze Breivik from an ego development perspective. To perform this analysis the ego development theory according to Robert Kegan’s subject-object theory (Kegan, 1982, 1994) is employed. From Kegan’s theory we can draw some conclusions about his ego development based on his ability to control his thoughts and behavior and evaluate what Breivik has as an object vis-a-vis what he is embedded in and takes for granted.

In his diary, (Breivik, 2011, pp. 1414-1472) Breivik describes an episode where he thinks that the police have discovered the barn where he keeps his explosives and equipment. Initially he panics, and begins to fantasize about a SWAT team that awaits him and hidden monitoring devices in his house. He searches the barn and the house, finds nothing and draws the following conclusion.

> Paranoia can be a good thing, or it can be a curse. The barn door had probably been opened by the wind. I decided then and there that I would not allow paranoia to get the best of me again. If they were to come for me one day, there was really nothing I could do about it, so it would not be constructive to worry about it. (p. 1457)

This is a typical example where Breivik reasons around his own psychological reaction and takes responsibility for it. He can also make the connection between the external event and his inner reaction. He is able to learn a lesson from what happened and aims to control his reactions better in the future. The "paranoia" is handled as an abstract variable that is useful as a servant, but not as one’s master. Thus, a fairly high degree of self-control is exhibited.

Breivik is devoted to the ideology he has chosen for himself, so devoted that he appears to treat it as a life purpose. However, he cannot relate to his ideology or examine it critically; he is completely embedded in it and has his ideology as a subject. In terms of Kegan’s subject-object theory this corresponds to the self-authoring mind or 4th order of consciousness.

When considering how long he planned his project – nine years – while always acting rationally so as not to reveal himself or his plan, the case for him being at least a self-authoring is strengthened. This is likely also higher than the average Scandinavian. However, higher than self-authoring mind he is not, since he cannot relate to or critically examine his own ideology, which he is embedded in and even willing to die for. A characteristic of the next ego development stage, self-transforming or 5th order of consciousness, is that the person no longer identifies with a single ideology and has the capacity to take as object and critically examine different ideologies.

Finally, we can note that Breivik was capable of consciously regulating his inner states in order to achieve his goals. His cold-bloodedness at Utöya was exceptional, where he gunned down 69 mostly young people after dressing up as a police officer – even calling out to them offering his "help" in the ongoing chaos and fear. By his own account he ingested high dosages of synthetic male steroid hormones, as well as an "ECA stack" containing the stimulant ephedrine, which can be viewed as a direct strategy to suppress fear and fuel aggression, enabling him to carry out the hideous deed without second thoughts about killing as many people as possible (Gysin & Greenhill, 2011).

Breivik's Motivation and His Relationship to the Values of the Scandinavian Culture

One remaining question is where Breivik got his motivation to act out in the horrifying and bizarre way that he did. One piece of the puzzle is without doubt his Spiral Dynamics "Blue" values. It is normal to expect him to stand up for his values, and living in a postmodern "Green" society, the drive to defend his values will be even stronger.

However, this explanation taken on its own is insufficient. The "Blue" value system will defend its values quite strongly, especially since being proud of your values is built into this very value system. But rarely will a person with these values go to the extreme measures that Breivik did, and it is more than unfair to hold the value system itself responsible.

A starting point for understanding Breivik's motivation is his relationship, or the absence of a relationship, with his father. At age one, his parents divorced. After a custody battle that the mother won, Breivik's father stayed abroad while his mother settled down in Oslo. Not only did his father maintain physical distance from his son, but he seems to have been actively disinterested in him. In an exclusive interview with Swedish newspaper Expressen, the father Jens Breivik says (Kvarnkullen, 2011): "We haven't been in touch for 16 years, since 1995. He was very difficult. He wanted to go his own way and he hasn't had a need to be in contact with me." The father not only abandons his son, but blames his son for his own inability to connect and stay in touch. It's probably safe to say that this created a huge sense of loss within Breivik, and a set of abandonment issues that do not easily heal.

We know from various research reports that an absent father increases the risk of criminal behavior in children and young adults, especially for boys (Flouri & Buchanan, 2002a: Harris et al, 1998). Research also indicates that a father's engagement decreases the risk for behavioral problems in children (Aldous & Mulligan, 2002). Finally, father involvement has been shown to increase life satisfaction in boys, and buffer the effect of bullying (Flouri & Buchanan, 2002b) – something that Breivik likely experienced in school (Carbone, 2011).

Taken on its own, a boy growing up without his father is a significant risk factor for criminal and psychiatric problems. However, Breivik was not only abandoned by his father, he was also faced with surroundings that were far from male positive. The Norwegian culture was, and is, deeply affected by feminism, and even Breivik's mother was a moderate feminist, according to his manifesto.

Feminism or being a feminist needn't be anti-male, but the large scale Scandinavian experiments of integrating feminism in various aspects of politics and the media have shown that when implemented as the sole model of gender issues, feminist ideas lead to negativity towards men, masculinity, and manhood. It's important to point out though, that Scandinavian feminism has been implemented with the explicit approval of male leaders – and with significant resistance from many women – so the Scandinavian feminist project should not be viewed as a female project nor "blamed on women."

All in all, the young boy was faced with an environment that made it difficult to establish a healthy male identity. This is not to say that a healthy male identity is a single object nor that it is a static entity that does not change over time and between cultures. We would do well to not reproduce the extreme polarization of the sexes that at times has been present in human history.

However, there are real differences in men's and women's neurohormonal biology that give rise to different impulses, choices, and interests in each sex (Lippa 2010; Sapienza et al, 2009; Schmitt et al, 2008.). Normally, male environments with a male value sphere are where boys learn how to harness those impulses in a healthy way, by cooperating with other men and watching how they handle themselves in various situations. With an absent father in a male-negative culture, accessing any type of male value sphere can be hard.

So what happens to a boy who is denied a connection to a father, and then grows up in a culture that denies the very existence of positive male qualities? How can he connect to his own maleness? How can he make the passage from boy to man?

This part of our paper is the most speculative, but a qualified assumption would be that Breivik not only felt abandoned by his father, but also by his whole country, a country that would not affirm or encourage his male identity. People may have different opinions on the necessity of a specific male value sphere to foster a healthy version of masculinity, but would anyone reading this wish to deny boys a sense of ownership of, and pride in, the biological sex they were born with? We imagine this is what happened to Breivik.

This is what Breivik (2011) himself has to say about his upbringing: "I do not approve of the super-liberal, matriarchal upbringing as it completely lacked discipline and has contributed to feminising me to a certain degree" (p. 1387). When this abandoned boy with a fragile gender identity then proceeds to start school, he encounters boys with an immigrant background. These boys seem to have none of the issues that he experiences in his own life, and seem quite stable and thriving in their male identity.

This is what Breivik himself writes in his manifesto, on the topic of immigrant boys and their male identity (Breivik reduces immigrants to “muslims,” which obviously is wrong):

> Muslim girls were off limits to everyone, even the Muslim boys. The only available “commodity” at this point was therefore ethnic Norwegian girls, referred to as “whores.” Due to the tolerance indoctrinated through Norwegian upbringing – girls aren’t brought up to be sceptics, racists or anti-immigrant, just like most boys. They are all brought up to be very tolerant. As a result, many ethnic Norwegian girls, especially in Muslim dominated areas, despise ethnic Norwegian boys because they consider them as weak and inferior with lack of pride, seeing as they are systematically “subdued” by the “superior Muslim boys.” Ironically, Muslim boys are raised to view Norwegian girls as inferior “whores.” Their only purpose is to bring pleasure until the Muslim guys are around 20-25 when they will find a pure, “superior” Muslim girl, a virgin. At this point, the ethnic Norwegian “whores” is discarded, and most of the girls go back to their old “tribe.” They are welcomed back in the name of tolerance. (2011, pp. 1376-1377)

Breivik may be disturbed, and his writings twisted and exaggerated, but his basic observational and analytical faculties are quite intact. He notes that immigrant boys sometimes end up high in the male status hierarchy, since they are more often in touch with their own vitality and self confidence. Norwegian boys have instead faced pressure to hide displays of anger or vitality, as this is seen as oppressive when coming from a male.

As Breivik points out (in his own harsh way), it is true that some immigrant men view Scandinavian women as commodities – women that are fine to have sex with, but who are unworthy of being a man’s wife. It is also true that some immigrant women who live in Scandinavia do not have the same rights and freedoms as ethnically Scandinavian women. Formally they do, but in practice they are subdued and controlled by their parents. A survey commissioned by the Stockholm Municipality, and carried out by Stockholm University, found that 23 percent of 15 year old women were expected to be virgins until their wedding – in survey group where 40 percent were immigrants (Schlytter et al, 2008).

You would think that Scandinavia with its strong feminist values would have an easy time addressing these issues. After all, women’s rights have been at the top of the political agenda for a couple of decades. In reality though, politicians have done little to address these societal issues – leaving young immigrant women to lead a quiet life of oppression.

The main reason for this is multicultural values, which seem to take precedence over feminist values when there is a conflict. A cynical, but not entirely incorrect way to summarize how feminism and multiculturalism get along, would be like this: If a Scandinavian man does only 40 percent of the housework, then he’s patriarchal and backwards striving. But if an immigrant man restricts the everyday freedom of his wife and daughters then that has to be respected as part of multiculturalism.

The intersection of feminism and multiculturalism has produced some spectacular double standards. These contradictions were fodder for Breivik’s mind, a mind that was already hurting down to its core after the abandonment of his father – while simultaneously being a mind that had extensive cognitive capacities. Instead of turning towards his own wounds, he projected his hurt, his abandonment, and his hatred toward the undeniable double standards of postmodern Scandinavia – double standards that his mind was more than capable to identify and analyze.

He may have been driven by deeply unhealthy impulses, and he may have had a tendency to project and externalize that which could only be resolved within himself. But a few of his observations highlight real issues, once you subtract his islamophobia and his disturbed solution to the perceived problem.

The real danger here is not that we forget to condemn Breivik, or that we forget to maintain our open societies. All of that is already happening in Norway and Sweden. The real danger is that we forget to learn from this incident. The real danger is that we do not listen to what this hurt little boy with impressive adult cognitive capacities had to tell us.

Conclusion

Looking at the clash of the two value systems, the traditional and the postmodern, we note that potential conflicts between these two are likely to escalate, unless some kind of healthy reintegration is found. A typical "Green" view of the post-Breivik landscape would be to stand fast in the conviction that postmodern values are the most correct and that they eventually will triumph over traditional values. This is, however, as all familiar with developmental theories know, a false assumption. According to Graves and the Spiral Dynamics theory, for a certain value meme to exist, all previous value memes have to be present by necessity as well. If postmodern values are to exist there will always have to be traditional values present in the culture.

Scandinavian politics and media have more or less been shunning traditional values, bypassing them for the benefit of implementing tolerance and openness. While noble in intent, this is not a functional way to run a country – nor what Graves would call a "healthy spiral." Elements of healthy traditional values need to be reintegrated in Scandinavian politics and media; in fact, we believe this to be a prerequisite to taking the jump into Yellow values, the stage after Green, which can be viewed as a synthesis of all the previous value systems. Basic "Blue" values provide the structure and security needed for tolerance and openness to thrive, and can help us strike a balance between welcoming immigrants to our countries – while also making sure we decide on yearly quotas that the country is able to successfully handle and integrate.

Outside of the extreme example that is Breivik, traditional and nationalistic values have become more prominent in the last few years. All Scandinavian countries now have a political party with these values, and they are gaining momentum. Faced with these emerging impulses, postmodern politicians and journalists need to realize that within the "traditional crowd," there will be individuals such as Breivik's idol Fjordman, with access to systematic and metasystematic stages of reasoning. The "Green" establishment therefore needs to sharpen its debate skills to hold its own in future political discussions. As much as a portion of constructive traditional values need to be reintegrated in Scandinavia, it would be a disaster if they were to become politically dominant in the current fragile economic climate.

Turning to the attacks themselves, a relevant question is: could they have been prevented? Were there any warning signs that the Norwegian authorities should have been aware of? In our opinion, no. Breivik is a complex thinker who is rational and mature in terms of ego development and most importantly, he worked completely alone and didn't share his plans with anyone. He was very elaborate in holding up a facade to his friends and family and he was careful not to leave any trace of his activities. Therefore we would also say that Breivik is extremely rare with his combination of intelligence, cold rationality, and "bottled up" aggression.

However, when it comes to the absence of male value spheres and male role models in his life, he is far from unique in our societies. In order to prevent even one new Breivik from appearing, Scandinavian men need to step up and reclaim a space for healthy male expressions, both in their families and in the culture as a whole. Even though parts of the Scandinavian culture can and probably will resist this, men simply cannot sit and wait for permission to do so. We need to show our boys a path towards mature manhood, while fostering and cultivating healthy male expressions in ourselves.

Women and men can also work side by side to change the dysfunctional parts of our gender politics. Working with women's issues has been tremendously important for the past few decades, and will continue to be important in some ways. On the other hand, important men's issues need to be integrated in the gender politics, to get a more balanced view of gender equality. Hopefully, such a process can lead to a lessening of the cultural misandry (contempt for men) that exists in media and politics – just like we have been successful in removing misogynistic expressions in media and politics.

Finally, the horrible insight that we have gained from this analysis is that Scandinavia produced Breivik. As important as it is to talk about facing violence with more love and more openness, we will at some point have to address the fact that we produced him, we put together the environment that bred his hatred. If we do not, we will fail to learn from this tragedy, and the next incident might be even worse than the one we have just experienced.

The Tyranny of AQAL[1]
Reflections on the JFKU Integral Theory Conference, July 2010[2]

Hugh & Kaye Martin[3]

When you play the game of Scrabble, do you notice how play sometimes gets scrunched down into one small corner of the gameboard? People keep coming up with ingenious new words, but they are confined to a shrinking and increasingly congested space. That's the way we often felt about the July 2010 Integral Conference at JFK University. Stimulating and often brilliant, but generally limited to one small (but highly important) section of the Integral gameboard.

At a conference with so many enticing speakers, we like to browse. To get the lay of the land, we circulated among three or four presentations during each workshop session, gleaning the essence of the speaker's presentation. Then we supplemented those initial impressions by reading the appropriate papers, and later listened to the recordings of each speaker who seemed to have something especially valuable to say. In the course of those three days, we surveyed some remarkable presentations by Kegan, Smith, Cook-Greuter, Forman, Esbjorn-Hargens, Visser, Combs, Marquis, Hubbard, Ganti, Parlee, Roy, Whetton, Golin, Fuhs, Zeitler, Ingersoll, Meyerhoff, Reams, Gafni, Hamilton, Schlitz, Fischler, Laske, Smith, Walsh, Anderson, Ross, O'Fallon, Patten, Winton, and Stein, among others. In almost every case, the underlying subject was AQAL, and the underlying assumption was that some version of AQAL was representative of or virtually equivalent to Integral. In other words, the primary or exclusive subjects of inquiry in most of these presentations were the parameters of quadrants and levels – with lines, states, self, and/or types occasionally thrown in for good measure.

---

[1] AQAL is a "tyranny" in the metaphorical sense. That is, the AQAL paradigm is becoming so unnecessarily narrow and restrictive that it inhibits inquiry into a broader range of integral distinctives and alternative models. "Tyranny" is used here, not in the polemical sense, but as a quasi-technical term that describes the fourth stage of the four-generation cycle of cultural development, as outlined by Strauss and Howe. (See the section The Evolution of Integral later in this article.)

[2] This article is not a "report" on the conference per se. Rather, the conference is used to provide a context of common experience that readers who were conference attendees can use to assess the validity of our contentions.

[3] Hugh & Kaye Martin have contributed six book-length studies on their ADAPT Model to *Integral World.net* – several of which frequently rank among the Top 50 in IW's readership rankings. Hugh & Kaye are best qualified as integral practitioners and theorists because they have led integral lives. Both have richly diverse backgrounds in a multitude of fields: personal transformation, natural medicine & health, artistic & creative expression, teaching & education, societal change, natural & cultural environments, advanced academics, and marriage & family. Hugh received his degrees at Swarthmore, Penn, and UC Berkeley. Kaye received her degrees and certifications from Cal State Fullerton and Bauman College.

Wilber's Full Range of Parameters

We found ourselves asking throughout these presentations such questions as, All well and good, but what about Wilber's other parameters? What about all the factors of human development[4] delineated in *Integral Psychology* and other seminal works that constitute Wilber's extended Integral Operating System (or IOS)?[5]

Yes, quadrants, levels, lines, and states are extremely important, but what about other Wilber concepts relating to the dimensions of the growth process? What about the great nest, map, wave, trait, transformation, ladder, correlative structure, chakra, spiral, realm, plane, sphere, physio-biosphere/ noosphere/ theosphere, terrestrial realm, plane of existence, celestial plane, stream, height & depth, U-shaped pattern, pathology, and pre/trans fallacy?

Yes, self and types are important, but what about other Wilber concepts pertaining to the participants in the growth process? What about proximate & distal self, self-system, archeology of self, ego, bodyself, felt body, culture, role, voice, gender type, agency vs. communion, eros vs. agape, Enneagram, subpersonality, shadow self, functional invariant, I-I self, true Self, and soul?

What about Wilber concepts that are aspects of the processes by which growth takes place? What about fulcrum, embedding, metabolism, horizontal translation, vertical transformation, actualizing the great nest, uncovering, methodology, modules of Integral Life Practice (ILP), treatment, therapy, evolution & involution, transcend & include, sociocultural evolution, and waking up?

What about Wilber concepts that are features of the guidance and orchestration of the growth process? What about navigation, integration, spirit-in-action, Integral Institute, full-spectrum therapist, witness, seer, pure consciousness, and spirit?

We grant that at least some additional topics beyond the AQAL matrix were covered in the conference. However, we would contend that the preponderance of talks accepted the AQAL model as the central organizing principle of integral theory ('forms the basis for much of our shared vocabulary,' in the words of one commentator) -- and that in fact many presentations treated AQAL as the very definition of Integral itself.

Ken Wilber is one of the great generalists of our time. He may not get all the particulars right, but he is terrific at sketching out all the elements worthy of consideration. Wilber's *Integral*

---

[4] Yes, integral theory is more than human development. But not a whole lot more. Human development is a very comprehensive field that subsumes many other more specialized fields – such as parenting, teaching, counseling, therapy, organizational consulting, academic research on human development, and the orchestration of one's own personal growth and self-improvement. From a wider perspective, human development encompasses all areas of human endeavor where people grow and evolve – fields as diverse as psychology and education, history and economics, science and technology, art and music, literature and film, ecology and metaphysics, ethics and social activism, health and sexuality, religion and pop culture. The great majority of conference presentations applied Integral to one or more of these topics.

Thus, human development in some form was by far the most commonly-addressed topic of the conference. But more generally, human development is in our estimation the most fruitful field for Integral investigation. Human growth is the developmental system we know most about. Therefore, it yields the most detailed set of parameters upon which to base any Integral model that aims to be comprehensive.

[5] Wilber's IOS is described in the next section, If Not AQAL, What?

Psychology is perhaps the most structurally-sophisticated of his works. Despite its apparent simplicity, this remarkable book goes furthest in delineating all the factors that constitute a complete theory of human development. If we ignore or underestimate a significant portion of those factors, we run the risk of overlooking some of Wilber's main contributions to human thought. Moreover, if we fail to incorporate that broader range of factors into a comparably broad system, we are contravening the central principle of Integral – i.e. that all the factors we are considering are 'integrated' into a single, comprehensive model.

If Not AQAL, What?

At this point, a question naturally arises in the reader's mind: "If not AQAL, what?" If AQAL is not to be the central organizing principle of Integral Theory, what can we offer to replace it?

We ourselves began asking that question about seven years ago. After careful study of *Integral Psychology* and other important works by Wilber and other Integral thinkers, we began to recognize the limitations of AQAL. It became clear that AQAL was only one important aspect of Wilber's own extended model of human development – what we call his Integral Operating System (or, IOS).[6] At the same time, we became increasingly aware that the AQAL mindset is extremely pervasive in the Integral community. Then, very gradually, in the course of publishing a series of six book-length studies on *IntegralWorld.net*, the outlines of a revised and expanded model[7] began to take shape. That model incorporates all the parameters that Wilber explored in *Integral Psychology*, adds a few more to fill in the gaps, and organizes all those parameters into a simple but comprehensive system called ADAPT – All Dimensions, All Participants, All Processes, Together.[8]

Thus, to continue the Scrabble metaphor, AQAL is just one important corner of a much broader Integral gameboard. Wilber's expanded IOS enumerates many of the other important squares on the gameboard. The ADAPT model endeavors to show how all those squares can be arranged into a cohesive gameboard pattern.

Any new system, especially one that challenges a model as beloved as AQAL, inevitably encounters much resistance. Here are some representative objections, critiques, and suggestions we received[9] regarding our own system, along with our rejoinders. Any other alternative model would receive similar comments.

---

[6] Wilber's audio series from Sounds True is entitled the Integral Operating System. There he discusses AQAL principles as applied to real life. We are using the term 'Integral Operating System' here in a much broader context.

[7] We do not consider ADAPT an 'alternative model' or 'competing model,' because it is derived from Wilber's own model and consists primarily of Wilber's own parameters. That is why we call ADAPT the 'next generation' of AQAL.

[8] For details, see our conference presentation, AQAL, the Next Generation, or the more extended version on IntegralWorld.net. We refer to our studies, not as a form of self-promotion, but to show that it is indeed possible to devise a viable Integral model that is far more comprehensive and far more 'integrated' than AQAL.

[9] From over a dozen conference speakers and many attendees, not verbatim.

- **Too big a playing field.** "That's just too big a playing field for integral theory to absorb right now." Our response: You don't have to play on the bigger field until you need it. In the meantime, just acknowledge it's there.
- **Too AQAL-phobic.** "Your approach is too AQAL-phobic. You attack or denigrate a line of inquiry that has proven immensely fruitful." Our response: On the contrary, we consider AQAL a magnificent contribution to human thought. Now we can use that great example to become even more comprehensive.
- **Too Wilber-centric.** "This approach is too Wilber-centric. Concentrating on Wilber is passé." Our response: Any good theory builds on the best work that's gone before. The colossal contribution of Ken Wilber is a place all of us have to start. In the words of the "great one," before we can "transcend" Wilber, we must "include" him.
- **Too complicated.** "Your new theory is complicated and hard to follow." Our response: Every new theory seems complicated at first, because it is unfamiliar. However, the basic model of ADAPT is simplicity itself: Life is a journey by sea, or "human odyssey;" that journey has a map, a set of voyagers, a ship, and a navigator/captain. The complexity comes only as we drill down into the nested holons beneath the main concept to explore the details.
- **Requires too much retooling.** "Your approach would require too much reconfiguring and retooling." Our response: You have the option of retooling, but you don't have to. If you concentrate on AQAL, just recognize that you're specializing in one very important niche.
- **Broader than Human Development.** "Integral theory is broader than human development alone." Our response: see footnote 4.
- **Different objectives.** "Your aims and objectives are much different from ours." Our response: Very true. Integral theory as an academic discipline often seeks to identify the fundamental structures of reality. Integral theory from our perspective seeks to identify the structures, sequences, and systems that make human life significant and rewarding. (See footnote 4.)
- **Not rigorous.** "This approach is not meta-theoretically rigorous enough." Our response: Like any social science, a full-bodied integral theory will always be half-science, half-art. The rigor of meta-theory is extremely important. But that level of rigor can sometimes inhibit the flashes of brilliant intuition that brought us "integral" in the first place.
- **Not academic.** "Your model is not framed in language and argumentation that is sufficiently academic." Our response: Wilber himself was often judged not sufficiently academic by many speakers and panelists at his own conference! What chance have we got?

The foregoing objections may all have some validity. However, the central issue remains: Integral theory is concentrating its attention almost exclusively on one small corner of a much broader field of inquiry. By limiting itself to a few major concepts, integral becomes not a "Theory of Everything," but a "Theory of a Few Very Important Things." By failing to show how the full range of concepts fit together, it ceases to be "integral" at all.

We are not claiming that our ADAPT Model is the answer. Any valid revision of Wilber's AQAL and IOS will ultimately require the collaborative efforts of many authorities on the Integral worldview. However, we are confident that we have struck upon some key points of discussion that must be addressed before integral theory can evolve to its own next level.

The Evolution of Integral

According to Strauss & Howe (*Generations*, 1991, and sequels), cultures may evolve over decades of time through a mechanism they call the *generation cycle*. A generation is the biological period of life, normally about 20-25 years, between the time one is born and the time one first procreates. According to the authors, dynamic cultures repeatedly pass through a generation cycle consisting of four characteristic generations.

1. *Prophetic generation:* Conceives a new cultural vision and a new impetus for change;
2. *Reactive generation:* Reacts against or detaches from the dominance of the prophetics;
3. *Civic generation:* Fills out and implements the vision of the prophetics;
4. *Bureaucratic generation*: Institutionalizes and standardizes what once was the prophetic vision.

After the four generations are complete, the cycle repeats all over again – but at a higher level of development, and with a new prophetic vision.[10] The transition from old to new vision is sometimes an arduous and painful one. Adherents to the old system experience its departure as the death of an old and dear friend. The original prophetic vision that began as a force for expansion and liberation can become in its later stages an entrenched “tyranny” that must be resolved before the next vision can be embraced.

Integral theory is itself a culture that is progressing through a generation cycle – in this case telescoped into 40-50 years, instead of the normal 80-100. In this schema, Wilber is of course the prophetic; incisive critics and skeptics like Visser and Meyerhoff are the reactives; brilliant actualizers like Cook-Greuter, many other speakers at the conference (as well as the JFK Conference itself) are the civics; and the bureaucratics are the natural tendency in all of us to cling to familiar, established truths.

We by no means presume to see ourselves as the next prophetics. However, we may be among the first to see the glimmering outlines of a new vision. We hope through our work to stimulate broader discussion on a topic of central importance – the very structure and scope of the field of integral theory itself.

---

[10] Editors’ note: For additional discussion of these generations, see Ken White’s Politics in a new key: Breaking the cycle of U.S. politics with a generational/developmental approach in Integral Review’s special issue on politics, at http://integral-review.org/documents/White,%20Politics%20in%20a%20New%20Key%20Vol.%206%20No.%201.pdf]

What are basic assumptions, and which effects do they have in our time? On "paradigms" and "paradigm change" in the contemporary political and social domain, and the consequences. A conversation with Roland Benedikter, Stanford University.

Was sind, und wie wirken Grundüberzeugungen in unserer Zeit? Über „Paradigmen“ und „Paradigmenveränderungen“ in der heutigen politischen und sozialen Sphäre – und die Folgen. Ein Gespräch mit Roland Benedikter, Stanford Universität[1]

This talk clarifies what is meant by the pervasive but seldom-precise use of the term "paradigm change." While it appears that this term is often (unwillingly) misused particularly by integral and progressive intellectuals and civil society groups as an instrument of predicting future *cultural change, it is argued that it should rather be used as a tool of analysis of the* past *and the* present *of basic cultural and scientific convictions that dominate their times. In fact, a "paradigm" is defined as a collective bias (or, to use a more technical explanation, a "knowledge-constituting collective prejudice") on certain issues. It defines the validity of what is meant to be true, and what to be false, and what can be accepted as valid, and what not, in a given society at a given time for a given period. A "paradigm" is always functioning (a) as a "constitutive paradox" because its claim is to define what is true and what not, but at the same time it is continuously replaced by new paradigms that coin different definitions - thus contradicting the very essence of "paradigm" as such; and (b) by incubation periods, i.e., by*

phases where different claims on what is valid coexist or even form hybrids among them. In the end, "paradigms" are something irrational and in most cases un- or half-conscious cultural formations; but they seem to exist in every period of cultural development. This talk explains the mechanisms of how dominating cultural biases become "paradigms" in order to rule temporarily over the academic and political correctness of their times; and how and to which extent the one-sided "paradigm fetishism" of the epoch of "postmodernity" is currently coming at its end, with new, more integrative and integral blueprints arising that are in their majority trying to balance the prevailing "paradigmatic" nominalism with new, empirical forms of neo-essentialism and neo-substantialism. Specifically, integral approaches try to create a paradigm for our time that connects deconstructivism and substantialism (realism).

Frage: Beobachter, Kommentatoren, Wissenschaftler und Medien sprechen heute immer öfters von einem Paradigmenwandel: in der Politik, der politischen Kultur, der zugrundliegenden sozialen Sphäre. Von einem solchen Paradigmenwandel ist für die Gesellschaften Europas die Rede, aber auch im Hinblick auf das Verhältnis zwischen Europa und den USA seit dem Amtsantritt von Barack Obama im Januar 2009. Das Wort „Paradigmenwandel" wird dabei sowohl sehr allgemein wie auch betreffend ganz konkrete Einzelfragen gebraucht, wobei der Zusammenhang zwischen großen, mittleren und kleinen Dimensionen nicht immer ganz durchsichtig ist. Der „Paradigmenwandel" wird ausserdem auch ganz unterschiedlich terminisiert; manche setzen ihn (oder Teilaspekte) mit den Terroranschlägen des 11. September, manche mit den Reformen der Schröder-Ära, andere wiederum mit der Finanz- und Wirtschaftskrise 2007-10 an.

Benedikter: Ja. Wir haben gegenwärtig sowohl eine synchrone Schichtung des Begriffs wie eine diachrone Streuung. Sehr allgemein wird das Wort gebraucht für aktuelle Systemveränderungen 1. in der Wirtschaft nach der Finanzkrise 2007-10, wo manche das Ende des bisherigen Leitparadigmas, des Neoliberalismus gekommen sehen; 2. im Bereich der Politik, wo mit der Entstehung einer multipolaren Welt der „wettstreitenden Modernitätskonzepte" („competing modernities") und dem Auftreten neuer Weltmächte wie China und Indien das Ende der von den USA ausgerufenen „Neuen Weltordnung" naht; 3. im Bereich der Kultur, wo mit dem Auftreten neuer Idealismen und Essentialismen das bisherige Leitparadigma des Westens, die „Postmoderne" an ein Ende zu kommen scheint; und 4. im Bereich der Religion, wo Bewegungen in Richtung mehr Demokratie, aber auch innere Richtungskämpfe in praktisch allen Weltreligionen, die bis an Spaltungstendenzen reichen (zum Beispiel in der anglikanischen Kirche, aber auch in Teilen des Islam) und bisherige Paradigmenformationen preiszugeben scheinen. Detailliert für unterschiedlichste Einzelfragen gebraucht wird der Begriff zum Beispiel für den „Paradigmenwechsel" der internationalen Diplomatie nach Wikileaks; für Großbritannien nach der Machtübernahme der Tories von David Cameron; für den Bewußtseinswandel in Umweltfragen der USA nach dem Ölleck im Golf von Mexiko; für das angeblich schleichende Ende der europäischen Sozialstaaten; für die globale „Renaissance der Religionen", seit einigen Jahren auch in Europa; aber auch für Obamas globalpolitische Orientierungsänderung, nämlich sein Umsteuern des US-Schiffes vom Atlantik in den Pazifik. Der Begriff wird also sowohl für ökonomische, politische, kulturelle und religiöse Veränderungen benutzt, wobei der Zusammenhang nicht immer klar wird: Handelt es sich um eine große, zusammenhängende und in ihren Einzelaspekten (wenn auch komplex) vernetzte Systemveränderung, oder sprechen wir von relativ unabhängigen Entwicklungen auf verschiedenen Gebieten, die unterschiedliche Geschwindigkeiten, „Tiefen“ und Wirkungen aufweisen?

Frage: In der Tat: Meist bleibt die Rede vom „Paradigmenwandel“ anregend, insgesamt aber eher diffus. Klären wir also zunächst das Grundsätzliche. Was versteht man eigentlich unter „Paradigma“? Und was wäre also ein "Paradigmenwandel"?

Benedikter: Ein Paradigma ist ein erkenntnisleitendes Vorurteil einer bestimmten Zeit, das die Kraft hat, gesellschaftliche Klassen und Gruppen auf gemeinsame minimale Grundüberzeugungen hin auszurichten, sowie grundlegende Diskurs-und Ordnungs-Sphären wie Wirtschaft, Politik, Kultur, Wissenschaft und Religion einer bestimmten Gesellschaft zu einem bestimmten Zeitpunkt auf kleinstem gemeinsamem Nenner in ihrer Grundausrichtung und in wichtigen Aspekten ihres Basiskonsensus zu vereinigen. Ein „Paradigma“ ist also in gewisser Weise der Zeitgeist in der Gestalt eines meist nicht formalisierten oder institutionalisierten, sondern "schweigenden" Konsenses, der darüber befindet, was als politisch, sozial, kulturell oder wissenschaftlich korrekt gilt. Weil dieser Konsens schweigend ist, ist ein „Paradigma“ etwas Kulturelles. Es ist ein Aspekt der Kulturdimension, das alle anderen Dimensionen wie Wirtschaft, Politik und Religion in sich aufnimmt, sich aus ihnen ergibt, und umgekehrt sie alle dann rückwirkend beeinflusst. Wenn man heute von einer Paradigmenveränderung spricht, dann meint man damit, dass sich das zuletzt verbindliche erkenntnisleitende Vorurteil in der Kultur ändert - so wie es sich in den europäischen und westlichen Kulturen ja mittlerweile alle paar Jahre ändert. Insofern ist ein Paradigmenwandel nichts Einmaliges oder Aussergewöhnliches, sondern im Gegenteil etwas, das immer wieder und auch immer häufiger vorkommt.

Frage: Inwiefern?

Benedikter: In den Sozialwissenschaften herrscht heute weitgehend Übereinstimmung darüber, daß die Zeit zwischen Paradigmenänderungen immer kürzer wird, weil sich - nicht zuletzt durch den wachsenden Einfluss von Wissenschaft und Technik - das Innovationstempo von Kultur und Gesellschaft ständig erhöht. Damit verkürzt sich die Geltungsdauer von allgemein kulturprägenden Grundüberzeugungen. Der Schweizer Wissenschaftsphilosoph Hermann Lübbe hat dafür einmal den (zugegebenermassen nicht sehr schönen) Ausdruck der "Gegenwartsschrumpfung" geprägt. Auf diese antworten die „postmodernen“ europäischen und anglo-amerikanischen Gesellschaften mit einer "zivilisatorischen Selbsthistorisierung" - das heisst mit dem musealen Festhalten und Erforschen von, aber auch mit dem (nicht selten ironischen) Spielen mit vergangenen "Paradigmen" oder allgemeingültigen erkenntnisleitenden Vorurteilen, das heisst mit Kultur- und Geltungsmodellen, die in ihnen früher einmal das Zentrum des Selbstverständnisses bildeten.

Frage: Das Interesse an einer solchen „zivilisatorischen Selbsthistorisierung“ ist in den vergangenen Jahren geradezu explodiert - man denke nur an den kulturwissenschaftlichen Trend, die 1970er, 1980er oder 1990er Jahre Revue passieren zu lassen, zum Beispiel in Musik, Mode, Wissenschaftsdebatten, Kunstwerken, Büchern, *welche die Unterscheidung zwischen „Dazugehörigen“ und „Aussenseitern“ thematisieren.*

Benedikter: Ja. Denn die „zivilisatorische Selbsthistorisierung“ hat viele Erkenntnisvorteile. Wenn man in die Vergangenheit schaut, dann sieht man relativ leicht, wie künstlich und zeitbedingt viele „paradigmatische“ Grundüberzeugungen waren - und demnach auch heute sind, jedenfalls aus der Sicht derjenigen, die nach uns kommen werden. Eben solche kontextbedingten Grundüberzeugungen aber konstituieren das "erkenntnisleitende Vorurteil" ihrer jeweiligen Zeit. Paradigmen sind etwas nicht völlig Rationales, sondern leben im Grunde auch viel von Irrationalem, aber es gibt sie zu jeder Zeit. Sie ergeben sich aus dem Zusammenwirken der wirtschaftlichen, politischen, kulturellen und religiösen Konstellation an einem bestimmten Ort zu einer bestimmten Zeit für eine bestimmte Dauer.

Frage: Als aus der Gesellschaft hervorgehende Grundüberzeugungen prägen sie umgekehrt aber auch ihrerseits die Gesellschaft?

Benedikter: Richtig. Paradigmen stehen mit ihrer Zeit immer in einem Wechselverhältnis. Sie wirken dabei ähnlich wie Mythen: Sie bestätigen und stabilisieren dasjenige, was ist. Paradigmen sind nicht Motoren der Veränderung, sondern Garanten des Gleichbleibens der Verhältnisse. Die Verhältnisse ändern sich aber zwangsläufig. Daher müssen „Paradigmen“ früher oder später immer neuen, anderen Paradigmen weichen – und seien sie auch noch so tief in einer Zeit, einer Kultur oder einer Gesellschaft verankert. Das widerspricht eigentlich ihrem Anspruch, das zu definieren, was Geltung beanspruchen darf, und das auszuschliessen, was keine Geltung beanspruchen darf. Insofern ist ein „Paradigma“ auch immer etwas Paradoxales: Es beansprucht, richtig und falsch zu definieren, und wird doch immer wieder von einem neuen „Paradigma“ abgelöst, das richtig und falsch (zumindest bezogen auf ihre Gesellschaftsvalenz, ihren Verbindlichkeitsgrad und ihre Praxisanwendung) wieder neu und anders definiert.

Frage: Was sind die Vor- und Nachteile von „Paradigmen“? Immerhin beruht ja die kulturelle Logik der westlichen Gesellschaften auf einer ständigen Abfolge neuer Paradigmen, die temporär herrschen und dann wieder verschwinden. In anderen, nicht-westlichen oder vor-modernen Kulturen wie zum Beispiel in Indien oder bei den Aborigines gibt es einen solchen Wandel nicht.

Benedikter: Das ist zumindest dann teilweise richtig, wenn wir das historisch sehen und die universale Technologisierung und Verwestlichung der vergangenen 200 Jahre ausklammern. Der Vorteil (wenn man dieses Wort hier überhaupt verwenden kann, denn es handelt sich um eine Tatsache eher als einen Vorteil) von „Paradigmen“ ist, dass man, wenn man sich mit ihnen beschäftigt, die Zeitbedingtheit von kulturellen Grundüberzeugungen erkennt, weil diese sich immer wieder wandeln. Der Nachteil ist, dass sich der Wahrheits- und Wissenschaftsbegriff, aber auch jede Wertevorstellung in Kulturgeschichte aufzulösen droht, wenn man sich einseitig an Paradigmen orientiert. Man hat dann früher oder später unweigerlich den Eindruck, dass letztlich nur künstliche, zeitbedingte kollektive Vorurteile als „Wahrheit“ gelten, die sich aber immer wieder, und in immer kürzeren Abständen, als blosse Vorurteile herausstellen. Gibt es also überhaupt keine „Erkenntnis“ oder gar „Wahrheit“, sondern nur die historische Abfolge von kulturellen Sichtweisen? Das kann das Ergebnis sein, und das führt zu einem Relativismus und Nihilismus in der Wissenschafts-, Kultur- und Gesellschaftsbetrachtung. Das würde ich als Problem ansehen, da es der Existenz eines gesunden Wertezentrums in einer Gesellschaft widerspricht. Eine Gesellschaft braucht jedoch meiner Meinung nach gewisse Werte, die nicht von vornherein als relativ oder zeitbedingt gelten, und auf die sich alle ihre Teilnehmer verlassen können, um stabil und fruchtbar zu bestehen. Das ist übrigens auch in der heutigen Kulturanalyse und Soziologie vergleichsweise unumstritten.

Frage: Zum Beispiel?

Benedikter: Zum Beispiel die Gesellschaftsform der Demokratie: sie braucht die „essentielle Überzeugung“ oder den „Werteabsolutismus“, dass Pluralismus, Vielfalt der Meinungen und Wettstreit der Ideen besser, produktiver und humaner sind als Hierarchie, Meinungsübereinstimmung und Durchsetzung einiger weniger „starker“ Ideen. Wenn man aber davon ausgeht, dass diese Werteüberzeugung eigentlich kein wirkliches Fundament im Wesen von Gesellschaft und Mensch hat, sondern eigentlich nur ein „Paradigma“, das heisst eben: ein zeitbedingtes Vorurteil einer bestimmten Gesellschaft zu einer bestimmten Zeit ist, dann hat Demokratie als solche eigentlich kein stabiles kulturelles Fundament. Und das kann ein Problem darstellen.

Frage: Ähnlich ist es wohl mit den Menschenrechten als Teil der weltanschaulichen und philosophischen Basis von Demokratie. Die wichtigsten Denker der „Postmoderne“ wie Jacques Derrida oder Michel Foucault haben in den 1980er und 1990er Jahren die Menschenrechte als rein „westliche Paradigmen“ interpretiert – sehr zur Freude von nicht-demokratischen Regimes wie China oder dem Iran.

Benedikter: Richtig. Wer davon ausgeht, dass die Menschenrechte nur eine „kulturelle Erfindung“ des Westens darstellen, aber eigentlich kein Fundament in einer „essentiellen“ Wirklichkeit haben, weil es eine solche „essentielle“ Wirklichkeit gar nicht gibt, wie die „Postmodernen“ behaupteten – und bis heute behaupten -, der hebt die Menschenrechte als Grundlage einer vernunftorientieren, humanen Politik eigentlich in ihrem Zentrum auf. Denn die Menschenrechte beruhen auf der Annahme, dass jeder Mensch einen unverletzlichen, „substantiellen“ Wesenskern besitzt, der seine unantastbare Würde jenseits aller Kulturen, Weltanschauungen und Zugehörigkeiten ausmacht. Das heisst, die Menschenrechte beruhen auf der Annahme, dass es „essentielle“, zeitüberdauernde und universale Dimensionen des Menschseins gibt, die sich der oben beschriebenen „Paradigmenlogik“ entziehen. Sie gehen davon aus, dass eben nicht alles nur ein Paradigma ist, sondern dass es zumindest in einigen Bereichen „substantielle“ Dimensionen der Wirklichkeit gibt. Die „postmodernen“ Denker zwischen 1968 und dem 11. September 2001 haben aber behauptet, alles bestehe nur aus Paradigmen. Damit haben sie die Menschenrechte faktisch ihres Geltungsfundaments beraubt – und in der Tat zumindest indirekt anti-individualistischen und anti-pluralistischen Gesellschaften wie zum Beispiel dem kommunistischen China in die Hände gearbeitet, das sich ja seit jeher notorisch gegen die Idee der Menschenrechte wehrt und diese immer schon als blosse westliche Kulturerfindung von nur temporärem Wert abgekanzelt hat.

Frage: Auch das ist paradox.

Benedikter: Ja, weil „postmoderne“ Denker wie Michel Focault, Jean Francois Lyotard oder Jacques Derrida, welche ihre Zeit ja akademisch auf beiden Seiten des Atlantik im Hinblick auf ihre erkenntnisleitenden kulturellen Vorurteile (das heisst „paradigmatisch“) beherrscht haben, sich als liberale Befreier verstanden. Sie waren eigentlich Anarchisten, die jeden Geltungsanspruch hinterfragen, wenn nicht gar untergraben wollten, um für die „totale“ Befreiung des Individuums zu sorgen. Dazu wollten sie nicht nur das „individuelle Allgemeine“ der Menschenrechte abschaffen, sondern auch jede „allgemeine“ Existenz von „Substantiellem“ in der Welt überhaupt zum blossen „Paradigma“ erklären. Aus heutiger Sicht wird immer klarer, dass dies gerade im Hinblick auf die wichtigsten „substantiellen“ Kernideen des Liberalismus selbst ein Eigentor war. Ein Großteil der europäischen Human- und Gesellschaftswissenschaften ringt aber immer noch mit diesem Paradoxon.

Frage: Worum geht es, wenn wir diesen Zustand produktiv weiterentwickeln wollen?

Benedikter: Es geht darum, eine Unterscheidung zu treffen, wo „Paradigmen“ tatsächlich wirken und wo man also, wenn man mit ihrer Hilfe die Dinge betrachtet, zu sinnvollen und zutreffenden Erkenntnissen kommt, und wo sie nicht wirken und man mit ihrem Begriffs- und Anschauungsinstrumentarium eher an den Dingen vorbeigeht. Ich denke, diese Unterscheidung ist eine zentrale Voraussetzung, um die heutigen Kultur- und Gesellschaftswissenschaften weiterzuentwickeln. Wir brauchen diese Unterscheidung, um mehrdimensionaler und komplexitätsfähiger zu denken, das heisst um an die vielschichtige Gestalt unserer Zeit heranzukommen.

Frage: Wie können wir uns diese Unterscheidung vorstellen?

Benedikter: Ungefähr so: Paradigmen gibt es, und sie sind wirksam, auch im eigenen, individuellen Bewußtsein desjenigen, der ihnen kritisch gegenübersteht, und in seiner Sicht auf die Welt (so auch, wenn ich das jetzt sage, in meinem eigenen Bewußtsein hier und jetzt). Aber sie wirken nicht überall, und man kann mit ihnen nicht alles erklären. Wir müssen den irrationalen Glauben an die Universalität von Paradigmen, den die „Postmoderne“ in den vergangenen 30 Jahren etabliert und zum Maßstab akademischer, kultureller und zum Teil auch politischer Korrektheit gemacht hat, neu mit der empirisch nüchternen Identifikation von „Essenzen“ verbinden. Das bedeutet: Wir brauchen eine neue Verbindung von „Nominalismus“ und „Geistrealismus“ – in rationaler, aufgeklärter und wissenschaftsfähiger Weise. Dann kann sich ein „Paradigmen“-Verständnis entwickeln, wo man sieht: „Paradigmen“ wirken als Kulturfaktoren im weitesten Sinn, das heisst überall dort, wo die Realität vom Zusammenwirken von Menschen abhängt. Sie erreichen aber nicht die Ebene der Natur, und auch nicht die Ebene des „Wesens“ des Menschen oder der Gesellschaft als solcher. Wenn wir in solcher Blickrichtung uns fragen: Wo gehören Paradigmen eigentlich hin, sind wir auf dem richtigen Weg. Man wird dann weder leugnen, dass sie größten Einfluss haben (und weiterhin haben werden), noch sich dazu hinreissen lassen, sie als allgemeingültig und universal für alle Bereiche des Lebens zu erklären.

Frage: Ist das nicht ein wenig wie mit einem verwandten Beispiel, das mir dazu einfällt: Mit Goethes „Anschauender Urteilskraft“? Sie wäre wohl das Gegenbeispiel zum „postmodernen“ Paradigmenfetischismus – ein Beispiel für die Überziehung von Geltungsansprüchen diesmal nicht aus „nominalistischer“, sondern aus „geistrealistischer“ Sicht.

Benedikter: Ich stimme dem voll und ganz zu. Manche behaupten, das damit beschriebene Methoden-Prinzip einer „nominalistisch-realistischen“ Anschauung der „Idee in der Wirklichkeit“ (beziehungsweise in der sinnlichen Wahrnehmung) sei universal, lasse sich also sowohl für die Betrachtung der Natur, als auch der Gesellschaft und des Menschen an sich anwenden. Ich bin der Meinung, Goethe hat dieses Prinzip nur für die Naturbetrachtung postuliert, nicht oder nur sehr eingeschränkt aber für die Gesellschafts- und Menschenbetrachtung, weil es dort kontraproduktiv, ja sogar schädlich wirken kann. Und vor allem, weil es dort eigentlich nicht hingehört seinem ganzen Grundcharakter nach. Weil heute beide Seiten: die nominalistische und die geistrealistische Seite gewisse Schwierigkeiten haben, ihre je berechtigten Geltungsansprüche innerhalb vernünftiger Grenzen geltend zu machen, ist es wünschenswert für alle, vor allem aber für die Entwicklung eines ausbalancierten Gesamt-„Paradigmas“ für unsere Zeit, wenn wir versuchen, einen „Meridian“ zu bilden: Ein „mittleres“ Paradigma, in dem sich Nominalismus und Geistrealismus wirklichkeitsorientiert verbinden und sich dabei gegenseitig, soweit nötig, auch korrigieren.

Frage: Sie sprechen in Ihren Schriften davon, dass die „Postmoderne“ und damit auch ihr „Paradigmenfetischismus“ heute an ein Ende kommen. Inwiefern können wir heute für die europäischen und anglo-amerikanischen Gesellschaften von einem „Paradigmenwechsel“ sprechen?

Benedikter: Ich würde bewußt nicht von einem „Paradigmenwechsel“, sondern von einem „Paradigmenwandel“ sprechen. Paradigmen „wechseln“ nicht abrupt (wie das Wort nahelegt), sondern sie wandeln sich langsam und stetig. Oft überlagern sich Paradigmen auch, was dazu führt, dass für einen gewissen Zeitraum mehrere „Paradigmen“ gleichzeitig Geltung beanspruchen. Manchmal hat sich die Zeit längst weiterentwickelt, und ein Paradigma besteht immer noch hartnäckig weiter. Das heisst: Paradigmen folgen oft dem Gesetz der Zeitverschiebung mittels Inkubations- oder Antizipationszeiten: Sie kommen meist später als ihre Zeit, oder auch früher. Auch folgen sie dem Prinzip der Akkumulation: Sie integrieren so viel wie möglich, und schliessen so wenig wie möglich aus, um länger Bestand zu haben und breitere Wirkung zu entfalten. Das trägt dazu bei, dass sich Teile oder Aspekte von ihnen verändern, andere aber weiterbestehen. Aus diesen Gründen würde ich von „Paradigmenwandel“ sprechen, und nicht von „Paradigmenwechsel“.

Frage: Einverstanden. „Paradigmenwandel“ also.

Benedikter: Mit der „Postmoderne“ kommt heute in Tat nicht nur ein Zeitabschnitt eines bestimmten „Paradigmas“, sondern möglicherweise auch der Paradigmenbegriff an sich, zumindest in der Totalität, mit der er die „postmoderne“ Epoche zwischen 1968 und 2001 beherrschte, an ein Ende. Seit dem weltpolitischen und weltkulturellen Wandel der Jahre

1989 bis 1991, und vor allem seit dem Symptomdatum (nicht: Ursachendatum!) 11. September 2001 ist ein Abnehmen der Wirkmacht des universalen (De-)Konstruktivismus der „Postmoderne“ nicht nur in den westlichen Gesellschaften, sondern auch auf globaler Ebene zu beobachten. Diese Entwicklung geht mit der Suche nach neuen, „substantiellen“ Werten und Orientierungen einher. Die Auffassung von Wirklichkeit wird heute insgesamt vielfältiger, geschichteter. Während die wertvolle - und meiner Ansicht nach ebenso unhintergehbare wie unverlierbare - Einsicht der „Postmoderne“ in die „Konstruiertheit“ von Gesellschaft und kultureller Wirklichkeit zu Recht weiterbesteht, wird sie um Experimente mit kulturübergreifenden, „essentiellen“ Ich- und Geist-Erfahrungen ergänzt. Der Paradigmenbegriff zieht sich gegenwärtig dorthin zurück, wohin er gehört: In die Kulturgeschichte, während der Wahrheits- und Erkenntnisbegriff in den Wissenschaften und im allgemeinen Realitätsverständnis unserer Zeit eine Wiederauferstehung feiert. Allerdings gibt es hier gewisse historisch bedingte Unterschiede: In den USA ist dieser „ausgleichende“ Trend in den Universitäten und in der allgemeinen Kultur sehr stark, während er in Zentraleuropa bislang schwächer ausgeprägt ist und langsamer voranschreitet.

Frage: Warum? Und was bedeutet es für die Entwicklung zwischen Europa und den USA?

Benedikter: Das hat vielfältige Gründe, und es hat auf beiden Seiten Vor- und Nachteile. In Zentraleuropa ist das Misstrauen gegen alle Art von „Essenzen“ aufgrund der historischen Erfahrung mit den Totalitarismen des 20. Jahrhunderts noch immer viel stärker ausgeprägt als in den historisch Idealismus-freundlichen und „essentialistisch“ ausgerichteten USA. Ausserdem haben die USA das Humboldt-Modell der Universität bis heute weitgehend kultiviert, und damit eine transdisziplinäre und balancierte Idee des Verhältnisses zwischen „Paradigma“ und „Essenz“, während Europa diese Tradition, die es selbst erfunden hat, weitgehend über Bord geworfen hat. Europa ist meiner persönlichen Beobachtung konstanter und daher auch langsamer in seiner Kulturentwicklung, auch, weil es eine viel längere Geschichte im Hintergrund hat, während die USA schneller, dafür aber weniger stabil in ihren Richtungnahmen sind.

Frage: Erwin Laszlo nennt den heutigen Wandel in den Ideengrundlagen der Zeit "Macroshift", du „globale Systemverschiebung“. Was soll damit im Hinblick weniger auf die Gegenwart, als vielmehr im Hinblick auf die Zukunft gesagt sein? Mit anderen Worten: Welche Zukunft erwartet uns? Wie wird das Paradigma der Zukunft aussehen?

Benedikter: Das ist eine sehr schwierige, vielleicht auch im Kern unbeantwortbare Frage. Paradigmenverschiebungen kann man meist nur im Nachhinein feststellen und beurteilen, wenn sie auch manchmal bereits während ihres Geschehens gewisse Züge offenbaren. Ich bin immer sehr skeptisch, wenn sie als Element der Zukunftskennzeichnung gebraucht werden, als Mittel, um die Entstehung von etwas „ganz Neuem“ zu postulieren. Einen Paradigmenwandel herbeizureden war in den vergangenen Jahren oft ein Mittel der Progressiven und Alternativen, um eine „Selbsterfüllende Prophezeiung“ zu generieren. Es ging oft gar nicht bewußt, sondern unbewußt darum, sozusagen zu behaupten es bestehe ein Paradigmenwandel mit Blick in die Zukunft, damit dieser sich dann auch ereigne wenn nur genügend Menschen daran glaubten. Wir müssen hier vorsichtig sein, denn vieles davon war und ist notgedrungen Propaganda, wenn nicht gar Ausdruck der

Verzweiflung an der Gegenwart. Also: Paradigmenanalysen sind als Vergangenheits- und manchmal auch als Gegenwartsinstrument der Anamnese und Analyse gut, als Zukunftsinstrument der Prognose problematisch. Natürlich kann man sie trotzdem dazu benutzen, aber man muss sich der damit verbundenen Probleme und Gefahren bewußt sein. Was ich einigermassen guten Gewissens sagen kann ist dies: Was heute im Gang ist, ist meines Erachtens eine durchaus globale Veränderung, die Einfluss auf alle Teile des Ganzen haben wird.

Frage: Sie haben eine Stiftungsprofessur in Santa Barbara und sind in Stanford engagiert. Wie erleben Sie von Kalifornien aus den gegenwärtigen Paradigmenwandel in den USA im Vergleich zu Europa? Inwiefern beeinflusst dieser Paradigmenwandel die Entwicklung des Politischen und Sozialen im Westen?

Benedikter: Zum Teil erheblich. Das gilt allerdings meines Erachtens wiederum stärker für die USA, weniger für Europa. Obama ist unter dem Slogan angetreten: "Wandel, dem man vertrauen kann". Er meint damit offensichtlich nicht nur einen politischen, sondern auch einen kulturellen Wandel hin zu einer neuen Ausbalancierung von Idealismus und Pragmatismus, von Ideal und Wirklichkeit, von Paradigma und Essenz. Das haben seine visionären Reden zu Rasse, Globalisierung, Finanzwesen oder zur Aussenpolitik gezeigt, und Obama hat den Anspruch auf „Paradigmenbalancierung“ auch immer wieder explizit vertreten und als den Kern seiner Amtszeit hervorgehoben. Obama will , dass ein inklusives Umdenken stattfindet. Das hat viele inspiriert und tatsächliche Änderungen hervorgerufen – im Gesundheitswesen, in der Aussenpolitik der USA, in Abrüstungsfragen zwischen den USA und Rußland. Andere Änderungen sind nicht gelungen, so zum Beispiel im Verhältnis zu China, dem Iran oder Nordkorea, wo Obama viel Zeit investiert hat, aber praktisch nichts erreicht hat. Daher hat er hier zuletzt auch wieder eine traditionellere, konfrontativere Gangart angeschlagen. Auch innenpolitisch ist der „paradigmatische Brückenschlag“ zwischen den Ideen von Progressiven und Konservativen, zwischen Demokraten und Republikanern nicht gelungen. Ganz im Gegenteil: der Graben zwischen den beiden Ideenformationen mit politischer Valenz ist tiefer denn je, und der Weltanschauungskampf wird erbitterter denn je ausgefochten. Hier ist von einem „Paradigmenwandel“ noch wenig zu spüren. Es findet in den heutigen USA unter Obama eher ein neuer „Paradigmen- und Weltanschauungskampf“ statt, der mit einer allgemeinen ideologischen Polarisierung der Gesellschaft verbunden ist.

Frage: In Europa ist all dies zumindest hinsichtlich der öffentlichen Sichtbarkeit weit weniger der Fall.

Benedikter: Ja. Führende Politiker wie Nicolas Sarkozy, Angela Merkel oder Silvio Berlusconi (um hier nur einige zentraleuropäische zu nennen) stehen eher für Stabilisierung denn für Wandel. Andere, wie etwa Gordon Brown, stehen in der Wahrnehmung der breiten Bevölkerungsmehrheit eher für das Alte denn für das Neue. Ich würde zusammenfassend sagen, dass in Europa derzeit eher ein Gefühl des „zu wenig“ an Paradigmenwechsel vorherrscht, während Obama in den USA eine starke, aber bislang auch stark polemisch und antithetisch bleibende Paradigmenbewegung ausgelöst hat.

Frage: Schliesslich: Was kann die Zivilgesellschaft auf beiden Seiten des Atlantik zu einem positiven Paradigmenwandel beitragen? Kommt der Wandel weiterhin vorrangig „von oben“, oder kann er heute und künftig mehr und mehr auch „von unten“ kommen?

Benedikter: Die Zivilgesellschaft kann an der Ausbalancierung des Gegenwarts-Paradigmas zwischen Realismus und Idealismus mitwirken, weil sie selbst genau am Überschneidungspunkt zwischen diesen beiden Polen angesiedelt ist. Sie kann dazu beitragen, eine ausgewogene und gemässigte „mittlere“ Anschauung zwischen Konstruktivismus und Neoessentialismus in der Gesellschaft zu verankern. Diese sollte ebenso nominalistisch-selbstkritisch sein, wie sie Ideale und humanistische Bestrebungen Ernst nimmt und als Wirklichkeiten auffasst. Damit kann sie dazu beitragen, die ganz ähnlichen Bestrebungen Barack Obamas, die „von oben“ kommen, „von unten“ zu unterstützen.

Wauld

Art by Andrew Campbell[1]

Wauld is the old Indo European word for *world*…

Into the Long

Sara Wolcott[1]

1. Out of the Short
Turning the bend we imagined
they would greet us like Giants
these Mysteries of the Isles, instead
they were so much smaller -
just a circle standing on a hill-side.

In that strange blue-florescent neon night-light,
we'd be hard pressed to find a ritual
much less a druid
instead just
raucous squeals and twisted dreads of that
breed of mostly-young hippie-consumers:
even before midnight,
beer cans and plastic strong-bows
litter our path.
That throw-away culture
colliding defiling melding - defining
the usually clean 'English Heritage site.'

Long: the plastic forks for the stringy wok noodles
will take decades to decompose
Long: the squeals and yells seemed to never end
just pass from one flippant smiling baggy-jeaned girl to another
Long: the pull, the pull of 5000 years -
we kept walking
Long: the sacred walk, the ancient walk,
of breathing and rhythm and rhyme.

---

sara.j.wolcott@gmail.com

SOME RIGHTS RESERVED

Picking our way amongst
debris blankets hash
we walked the walk
we had never been permitted to walk before we
crossed the barrier
that tonight of all nights the English Heritage
did not police
we crossed the barrier
that even we did not understand:
the young coming to greet
the Old Ones.

She gasped as we crossed the barrier.
Took my arm; her hands were cold
she said can you believe it
they suddenly seem so
big.

So much smaller than anything in London
When we crossed the barrier
size reconfigured itself to a world
without skyscrapers just human
muscle and laughter and (perhaps) faith.

Oh, these stones.
Crossing the barrier
that my parents crossed
before I was born when they
stood here
I now stand
I now stand
Amongst the standing stones
touch
5000 years of lichen and cold and warmth
nothing but compassion
we all reach out

to touch the Long
Not noticing
if we stand on beer cans.

All night we
kept staring at them.
She popped a little seed
told me it was acid and would only take
a few minutes to work -
He opened and drew back the strong bow
glowing golden light shining through plastic -
she carefully laid out the flimsy trash bags
to protect us from the wet -
(we were without wool blankets.
we were not our mothers.)
and we stared into the Long
embodied in the stone.

2. Centre Circle

I waited till after midnight
to fully enter into the Long -
I feared a mosh pit
but all that living flesh was more
akin to swimming among a thousand seals.

After my shoulders
began slowly to move
(how did they get so stiff?
Where have I been? - oh yeah - Lost
in the short.)
I took up the meaning of my given name:
princesssan, wise woman, minister-ess
she who (got away with) laughing at god
now standing on Stones.

Not so high
as a corner office I could touch
drummer’s head sitting beneath me
let his rhythm overtake me
dancing spontaneous yelling
embrace me.

Celebrating the longest day
through witnessing the shortest
(misty chilly) night:
Raise hands above head
draw down the moon;
Dear druids forgive us
we mean no usurpation; just responding
to that calling we risk forgetting -
into the long.

Looking amongst a sea of laughing untrained warriors
who do not know the ways of the druids
who do not know the chants or the songs
who do not know how to care for the dying
who do not know how to properly wash the dead
who do not know how to harness the energy
Who are looking ahead only dimly, drunkenly
I see the stones
holding the hooting descendents of their makers
such immense imperfection.

In this time of such planetary destruction
we are the ones they must rely upon for protection?
(or are they the weighty Guardians?)
do my fellow dancing fools know the collapse of the system?
regardless: the stones hold them.
They have seen so much more than I they know
the rise and fall of how many kings, civilisations, children.

In the flashing lights of cameras
even the stones in their stillness seem to be moving
opening
Maybe in the old days
it wasn't always proper somber rituals
by chieftains
but sometimes
people came to laugh drum scream
awaken the stones danced in their stillness
on the longest day of the year.

I in my remembered-role -
the men came to me
dancing, telling me
their confessions:
how they would never miss this night
how it gave them energy for months
how they couldn't explain it -
how they came to reclaim
their heritage, not to be bought
for 7 pounds - concession.

These men
in big boots with strong hands
that reached
for booze and women
and for the stones -
running their hands over the stones
in homage
turning to me he said
isn't it all just so
beautiful.

Yes, I said. Yes.
And you from America! they laughed
that their cousin might see

what their sister
who stayed at home to watch tele
did not.

There
amongst the stones
we knew ourselves: journeying
into the long.

3. The Separation

After the dawn broke
When the fields were filled with summer's colours
Rose 21st century England's barriers between
clean and filth, ruler and ruled, the poor and the proper
re-emerging at the order of class and power
taking the form of yellow-jackets with sharp teeth
the bobbies pointed to the exit - that way.
As if a circle ever had one exit.

Instinctively: resistance. fertile? the
lust
for the stones suddenly increased
inadvertently compulsively we
flocked to their side
reaching out
to caress
the Long.

We who cling to our caves and our fear
of one another we
hoped these
Guardians could teach us
of that which we can not remember
oh how long till we can touch them again?

That one, the tall one
his blue-gray skin etched with wind, rain, and kisses
(I suspect also - swords) I could
stand next to him and lean
he'd murmur the sweet nothingness
of the Long
that accepts infinitely the sorrows and joys
of those trapped
in the short.

But the bullet-proof vests
(we who seek to love are dangerous)
swept us away
(no need to glare.
I knew the rules of the game before I played.
This time, at least, I obey.)

Suddenly everything
(myopic animals/election cycles/quarterly reports
my time here) was
too short.

Leaving (not again)
I kept looking back we all kept
glancing as if afraid
they had moved
shuffling back into 'tourist mode.'

From the top of the hill
they looked small - even short.
Certainly cleaner,
tip bags piled neatly
in the far corner.

But my heart,
re-aligned by Giants

still remembers their rhythm.

So. I pick up someone else's trash
join the bus, the chatter, the 10am pub crawl
dozed on a train filled with suits
failed at talking sense into a silver-cuff-linked oil-man -
my fellow travelers confused
stones and humans. Where is the open heart?

May they also journey
into the long
before their short-termism
goes on far
too
long
that they forget
those terrible curses that befall grave-robbers
fossil-consumers
and the burial grounds
(where shall they go, do they know?)
and the henge
of standing stones
beckoning us
into the long.

A Report from the Inaugural European Society for Research in Adult Development (ESRAD) symposium on July 24-25, 2011 in Lund, Sweden

Kristian Stålne

On July 24-25, 2011, the European Society for Research in Adult Development, ESRAD, held its inaugural meeting and symposium in Lund in the south of Sweden. We were 22 participants from 10 countries: Sweden, Finland, USA, Norway, Germany, Great Britain, Portugal, Belgium, Iran (!) and Bulgaria, who met for two days of presentations, discussions, workshop, meetings, and getting to know each other. This "report from the field" is our public demarcation of the inaugural event.

20 of the symposium participants outside of Classicum. Photo: Gerth Hyrkäs

ESRAD is connected to the Society for Research in Adult Development, SRAD, which held its first meeting in 1981 at Harvard University where Michael Lamport Commons was the main organizer. Thirty years later, Michael was one of the initiators and organizers of this first non-American event along with Eeva Kallio from University of Jyväskylä, Finland, who had been promoting a European meeting for a long time, and Sofia Kjellström from Jönköping University and me from Lund University, both in Sweden.

SOME RIGHTS RESERVED

The symposium venue, the beautiful Classicum building, is the home of the Pufendorf Institute, a cross-disciplinary research institute inaugurated at Lund University in 2009 to encourage cross discipline interactions involving all faculties. Therefore, it served to be a most appropriate location for the symposium. Pufendorf Institute was also kind enough to sponsor the symposium by lending us the house for these two days for no charge.

The first day's program had a broader aim towards various aspects of adult development, such as political development, development of care, abuse of older people and postformal thinking. In the afternoon the inaugurating ESRAD took place and officers were elected, with Eeva Kallio as president and website manager, Sofia Kjellström as vice president, Kristian Stålne as secretary, and Michael Commons as membership coordinator. We also elected a committee to further investigate the details of how to register and where to base the organization.

The second day focused more on the Model of Hierarchical Complexity (MHC), with its theory and applications. Before lunch Michael, the founder, or gardener as he puts it, gave a workshop on MHC and presented various theoretical aspects of the model as well as the relations to models of adult development. The sessions after lunch aimed at applications of MHC and scoring according to its related Hierarchical Complexity Scoring System (HCSS).

The closing and sum up session made it clear that although we had two full days to present papers, get to know each other, organize and plan further activities, we would have had no trouble in filling up another two days. With the quality and amount of research that is being carried out here in Europe, it really feels that we have reached and exceeded a critical mass, which was confirmed by the creative and engaging interactions at the symposium.

The full symposium program along with abstracts and pictures is viewable at the new ESRAD website, http://www.europeadultdevelopment.org/, are available. We thank all participants who came to Lund for the many ways they made this a great first symposium! The future of European adult development research certainly looks bright and we surely look forward to further meetings and interactions!

The last word I give to José Alves, who in his speech quoted Leonard Cohen: "There is a crack in everything, that's how the light gets in." May ESRAD symposia continue to be a source of adult development light.

Organizational Transformation for Sustainability. An Integral Metatheory

Mark G. Edwards (2010). New York: Routledge.

An Appreciative (Over)(Re)View

Jonathan Reams[1]

Introduction

I began studying the field of organizational leadership back in 1995. I encountered a wide range of theories in the course of my masters degree studies. To find my bearings, I found myself aligning with a few ideas that appealed the most to me, and marginalized, even denigrated many of what I felt were the more pedestrian theories. I could argue at length with classmates and professors about why the theories I liked were so much better than the ones they were espousing. Anybody recognize this stage of relating to a new field of inquiry?

As my studies continued into a doctoral program in the same field, I took a course on leading organizational change. There, I had the benefit of a professor who had the capacity to vividly bring to life a different set of theoretical perspectives on the topic each week. I recall discussing with my classmates after each session that now, finally, "this was the way to understand what was going on." Then the next class, "no, this is it!" After six different classes and six sets of theoretical lenses, we began the task of trying to see how they could all appear so true, and how to organize them. At this time, the professor drew upon a systems approach to try to coordinate and show relationships between these sets of theories. This helped make some sense out of the chaos, giving us a degree of meta-perspective to situate the theories.

While this was indeed helpful and gave us a leg up from the feeling of being lost in the multitude of theories we had been exposed to, it was not able to address all the concerns I had at the time. Soon after this I came across Wilber's work and saw another way to make sense of the patterns of theories that I had been exposed to. However, my exposure to Wilber's work was not specific to the field of study I was engaged in, and left me with a lot of work to sort out how to make better sense of the truth domains and relationships among all these theories. Much of this work was left incomplete as it was demanding to do and took time, so the utility of Wilber's model didn't immediately reap its potential in this area for me.

Fast forward to 2011, and I finally get around to picking up Mark Edwards' *Organizational Transformation for Sustainability. An Integral Metatheory*. Bill Torbert says in his preface; "it

---

SOME RIGHTS RESERVED

ought to become a required touchstone for further theorising and research in organizational transformation" (p. xiii). I would add that it should be required reading to help graduate students in the field of organizational leadership and organizational change to enable them to have a domain specific foundation for understanding how to take a methodical, robust, and pragmatic perspective on the theories they encounter.

It is with this appreciative experience that I wish to present the core themes, methods, and outcomes of Edwards' work. My plan is to simply go through and describe his work in broad strokes to give you as a reader (and potentially a reader of Edwards' book itself) enough of a sense of the scope, depth, and complexity of the work. Once I have done this, I will conclude with some reflections on my experience encountering Edwards' work.

Organization of the Book

There are ten chapters covering the journey Edwards has taken in developing this integral metatheory. It is based on the substantial work he undertook for his dissertation. These ten chapters are preceded by a brief introduction to integral pluralism. Chapter one addresses the need for metatheory in the study of organizational transformation, while chapter two then sets out the domain of metatheory and some definitions. Chapter three takes on the task of defending metatheorizing from a variety of attacks is has been subject to over time. Chapter four shifts to the particular focus Edwards has chosen for this work, stories of organizational transformation. Then the method for building metatheory is laid out in chapter five. Chapter six then displays the results of this in the form of a multiparadigm review and analysis of theories about organizational transformation. Chapter seven takes this analysis and reveals a network of lens relationships. This leads to chapter eight where Edwards presents his integrative metatheory for organizational transformation. Chapter nine reflects on the work with an evaluative eye and chapter ten points towards an overarching integral metastudies. The scope of each chapter in itself is quite substantive. As Torbert says in his foreword, it is a demanding read. Demanding in that the reader needs to hold a complex series of highly developed constructions that draw essential elements out of each topic brought into view during the journey. With this quick orientation in mind, let's get the journey started!

The introduction sets the stage, opening with a lovely quote pointing to how a person with only one theory to address life in a meaningful way is truly lost. Edwards immediately sets out the need to be able to step outside and take theories as objects of reflection and tools to be used (liberating structures in Torbert's language) rather than being limited to or had by them. Yet simply having an array of theories in itself can confuse more than help, thus the need for a metatheory that can coherently integrate middle-range theories. This is no small task given the diversity of such theories. Edwards points to an integral metatheory as having the requisite capacity to address this challenge and links it to the global challenges being faced today. To make the task both manageable and practical/applicable, Edwards chooses to focus on the field of organizational transformation as applied to organizational sustainability. His introduction then lays out the terrain ahead and closes with a brief iteration of how his work sits within the larger body of research on theory and metatheory building and how the work on developing such big ideas can contribute to shaping society.

Chapter one is *The Need for Metatheory in the Study of Organizational Transformation*. Edwards opens with a quote from Karl Popper about being prisoners caught in our theoretical frameworks, from which we can, if we try, step out into roomier ones that can serve us better. The job of metatheory in relation to this is seen as being “the big-picture approach to knowledge that attempts to integrate other theory” (p. 10). He points out that not only do theories try and explain the workings (in this case) of organizations, they also influence their design. Once theories and metatheories are into such systems they tend to operate more as givens, the way things are, and are highly resistant to alternatives. Thus we become prisoners of our own ideas. Edwards situates his book as an effort to break out of the prisons we have become accustomed to by taking an integrative approach to metatheorizing.

Yet he is clear that the kind of integrative approach he wants to take is a pluralistic one rather than a totalizing one. He sees a need to be able to utilize an expansive enough framework to “respond to the multitude of vying theoretical perspectives” while also finding “ways of valuing the differences between mainstream and more marginal scientific discourses” (p. 15). This tension between mainstream and marginal discourses has not been sufficiently addressed by existing theoretical approaches, so Edwards sets out to show how an integrative pluralism can go beyond the responses of integrative monism, non-integrative pluralism and, inter/multi-disciplinarity. He then takes his more specific focus and goes deeply into the state of this situation in relation to organization and management theory. The existing diversity can easily contribute to fragmentation, exemplified by paradigm wars between functionalist and interpretivist approaches.

Edwards next takes up the scenario I described in my introduction as he examines how this theoretical pluralism can be frustrating for students. Having experienced this first hand, I can attest to the need for an integrative metatheory. Being on the other end of the issue now, teaching aspects of this work, I also recognize the challenges of trying to find ways to teach the complexity that an integrative metatheoretical approach brings. It is not simple to convey the way of looking that underlies such an approach.

Edwards closes this chapter by showing how an integral approach can address these challenges. He positions his work according to three aspects. First, that integral metatheorizing can be applied across disciplinary contexts, which is essential to address the kinds of diversity and fragmentation present. Second, he takes an appreciative meta-inquiry stance that recognizes that each theory contains some value. Third, he points to the long history of terms like integrative and integral being used in various traditions of metatheorizing, while situating his approach as not trying to create a “Theory of Everything.” Then he lays out the tools he will use in this work, namely Wilber’s AQAL or Integral Theory and Torbert’s Developmental Action Inquiry. These aspects, drawn together in this work, create a capacity for Edwards to approach the job of metatheory building in a methodologically rigorous manner.

From this foundation, Edwards takes us into chapter two, *Metatheoretical Domain and Definitions*. Here he does the work of identifying the domain and scope of his research. To begin this he outlines the tension between the kinds of specificity definitions push for with the kind of tolerance for ambiguity that is part and parcel of the domain of metatheory. Within that tension, he then examines definitions of organizations, organizational transformation, and within that, change, transformation and translation. Further distinctions are examined in relation to transformation and development as well as economic growth, mergers, acquisitions, and takeovers, and finally transitions. By surveying this range of terms, Edwards creates a model showing the relationship between organizational transformation, development, and expansion. Here we can already see hints of how his metatheoretical approach allows for greater scope and clarity to come into what is normally a fragmented set of discourses that don't interact with each other.

The same approach is brought to theory and metatheory building. Edwards goes through meanings of concepts, constructs, models, frameworks, theories and paradigms and how they relate to theory (and metatheory) building. Here he is able to show the relationships between grounded theory building based on case-based research, middle-range theory building based on variance-based research, and metatheory building based on conceptual research. The territory of metatheory becomes clearer as we are taken through rich descriptions distinguishing characteristics and relationships between these areas. He also addresses the notion of "orienting generalizations" in the context of metatheoretical lens. While Wilber uses the term as a way of justifying the foundation for his metatheory, or even as a methodology, Edwards redefines it as one tool for metatheorizing. Thus conceptual lenses become a core tool in the book, and are laid out as such:

> The lens metaphor is used here to emphasize the idea that theory not only receptively interprets research findings but plays an active role in shaping what we research. In the receptive sense, theory acts as an interpretive filter that structures and makes sense of the data and its subject matter. In the active sense, theory acts in shaping the real-world of empirical realities. (p. 42)

Lenses as a metaphor for concepts helps us see the central role that concepts play. In the domains of theories and metatheories, the active aspect of lenses' functions is often missed. Edwards goes on to say that "a conceptual lens does not merely interpret organizational objects, it is core to the process of constituting those objects" (p. 42). Thus the lenses we work with shape what we create, as well as how we perceive, and metatheorists use these lenses to build their overarching conceptual systems. Finally, to close the chapter, he draws on the term holon to have a non-reductive way to theorize about change.

Chapter three, *The View from Somewhere Else*, takes up the defense of metatheory, addressing a variety of critiques that have been raised against it. Edwards first takes on the modernist critique of metatheory as being a dead end because of being vague, hard to test, not practical, too concerned with categorization, and philosophical rather than scientific. He takes us through these critiques by acknowledging areas where their perspectives serve to illuminate real challenges (such as a lack of focus on method in the field) as well as showing biases and inconsistencies in the critiques. Next he addresses what are considered to be more challenging critiques coming from postmodern thought. These include how metatheory can be used as a tool for totalizing or creating "grand narratives" that marginalize various perspectives, which he addresses by pointing to how his pluralistic approach inherently avoids this. He also shows how it avoids neglecting local perspectives on issues. Another critique is that metatheory tries to take a view from nowhere, or perform the "God trick" of being value neutral. Further critiques relate to metatheory as being uncritical and decontextualizing. By addressing all of these challenges that exist in various discourses, Edwards is able to show how a pluralistic integrative metatheory actually includes both modern and postmodern strengths while addressing their shortcomings.

Having taken three chapters to do the background work of setting the scope of the work, laying out definitions, and addressing critiques up front, Edwards then turns to the task at hand and in chapter four on *Stories of Transformation*, reviews the scientific literature on organizational transformation and outlines the metatheoretical resources being used. He takes us through an historical overview of organizational change theories, showing how the field has evolved over time and used different terminology, and how those changes reflected changes in focus and theories in use. The different kinds of paths transformation can take are also explored, and a helpful table lays out the chronological stages and how they related to the prevailing socioeconomic factors in society at those times. The chapter also takes a more detailed look at the two core metatheoretical resources Edwards draws on, Wilber's AQAL framework and Torbert's Developmental Action Inquiry approach. He carefully shows the development and core ideas of each approach, taking five pages on Wilber's work and four on Torbert's. Thus the reader is well informed about the tools being used in this work and how their strengths and limitations (addressed in more depth in a later chapter) are being taken into account.

Chapter five on *A General Method for Metatheory Building* addresses one of the major critiques identified in chapter three, that the field of metatheory has been characterized by a lack of rigorous method. Instead, it has developed through philosophical insights, rational argumentation or idiosyncratic theory analysis. A central contribution of Edwards' work has been to address this by showing not only how a metatheoretical view can help the field of organizational transformation, but in the process also contribute to the field of metatheory building by exemplifying how to bring an adequate method to the apparent madness. To begin this work, he surveys existing approaches to metatheory building, covering traditional scholarship, the dialectical method, metatriangualtion, and multiparadigm inquiry as well as Ritzer's work in metatheorizing in sociology. Once these are described, Edwards critiques each of them as a way of outlining their limitations. For instance, Wilber's method can be shown to fall in the traditional scholarship area, which relies heavily on the unique capacities of the researcher. The use of orienting generalizations is then shown to be an outcome of the metatheorizing process rather than a method for it. Another example is in examining Burrell and Morgan's metatriangulation approach. Here Edwards sees that while drawing on two specific paradigms to build their metatheory, it "seems highly likely that there are more paradigms and metatheoretical lenses employed in organizational studies than just these two" (p. 91).

From his analysis and critiques, Edwards then lays out his plan. He describes an eight-phase general research design and method for metatheory building. This includes: groundwork, domain specification, design, multiparadigm review, multiparadigm analysis, metatheory building, implications, and evaluation. He then goes through how these phases are applied in his research project, giving us a clear and explicit description of how he is applying the work of bringing methodological rigor to his project of metatheory building.

With the method outlined, Chapter six takes us to *A Multiparadigm Review and Analysis of Organizational Transformation Theories*. Here we see the depth of Edwards' work in concrete terms. He begins by outlining the scope of a multiparadigm review, which

> differs from a standard literature review in that it specifically looks for concepts and themes that constitute the underlying architectonic of a theoretical system. It does this across multiple layers of expression, that is, at the level of basic constructs, parts of theories, complete theories, research paradigms and metatheories. (p. 101)

The units of analysis Edwards uses "are the core explanatory themes for each of the theories of organizational transformation" (p. 101). He subjected these to "multilayered analytical procedures, to develop the final, comprehensive set of metatheoretical lenses" (p. 101) used in understanding work on organizational transformation. Now, take the thought of doing all of this and apply it to a review sample of 335 books, book chapters, journal articles, and online papers! Edwards describes how he went from 472 explanatory themes from this review and categorized them according to 15 research paradigms. He notes that there was redundancy and overlap in this list as well, and how he used bridging and bracketing techniques to further analyze the data and reveal specific lenses.

Further categorization occurred through identifying different types of research foci. These included the what, why, how, and who of transformation. By organizing the categories of conceptual lenses around these five common framings, Edwards enables the complexity of the metatheory he has built up to relate to modes of perception and questioning that we all know. Within each of these frames are a number of specific lenses. Further, there are a set of three meta-level lenses Edwards identifies. This leads to the identification of 24 lenses of organizational transformation. This is a rich and complex result, yet appropriate to the richness and complexity of the phenomena being studied.

However, simply identifying these 24 lenses in itself could still leave us disoriented, wondering how to choose appropriately among far too many resources. Thus in chapter seven, Edwards goes into *The Network of Lens Relationships*. This work is based on three principles: internal consistency, high abstraction, and uniqueness. Looking at lens categories, external and internal relationships are examined to create categories of conceptual lenses. These include; holarchy, bipolar, cyclical, relational, standpoint, and multimorphic. The possible combinations of these lenses are beyond the scope of his work to comprehensively describe, so Edwards selects a few possibilities to illustrate the power and potential of this method. First he highlights the importance of the holon construct by looking at three forms of holarchical relationships; developmental holarchy, governance holarchy, and ecological holarchy. The details of these lenses and potential relationships among them reveal a much richer picture than what many of us are used to in mainly drawing on the developmental holarchy lens alone.

Edwards then goes on to illustrate a number of possible combinations of lenses and how exclusive reliance on specific lenses can become problematic from the view of these other lenses. He outlines a number of relevant critiques that viewing one lens from another lens can produce. An example he uses is between cyclical lens theorists and those who prefer bipolar or holarchic lenses. These examples help to make the case for a complementary approach rather than exclusionary one. Another issue he identifies is a kind of reductionism, where for example theories draw on only one pole of a bipolar dimension. This also applies to how multi-dimensional lenses can be reduced to bipolar framings by theorists. As if the large number of challenges in this are not enough, Edwards goes on to identify issues with conflating relationships between lens categories. To remedy these issues, he lays out a series of ten points to consider as guidelines for reducing these problems. This leads into an indexing of these metatheoretical lenses. A table illustrates one example of this, where Edwards show how an ecological holarchy lens with four levels (micro, meso, macro, and macro-macro) can be indexed with an interior/exterior lens, resulting in eight categories of lenses available to examine organizational transformation. This simple example displays the power of the framework Edwards has assembled. Further examples are given such as crossing developmental holarchy with transition process lenses, bipolar with quadrant lenses, and even looking at multiple lens combinations. This chapter illustrates how much more can be done with the flexible use of lens relationships than is currently common among theorists.

With all this behind him, Edwards turns to his focus of application in chapter eight on *Sustaining Visions. An Integral Metatheory for Organizational Transformation*. As is characteristic of his writing throughout the book, he begins by framing the topic in a manner that thoroughly situates the reader's attention. The reasons behind the choice of sustainability in relation to organizational transformation are laid out from a number of angles, all well supported. He then takes us through examples from each of the six categories of integral lenses that can be applied to the topic. Each of the twelve examples he provides illuminate the subject in a powerful manner. As one after the other is described, there is a feeling of having one's perception stretched as the horizon, scope, and complexity of the topic expands.

Of course this is only the beginning of the possibilities offered by the development of metatheory. Edwards goes on to show the real power of the framework he has been busy building by illustrating eight metatheoretical frameworks for sustainability. These are combinations of the previous integral lenses that create new matrixes rich with explanatory power. The first example combines two holarchic lens; developmental and ecological. The result is a matrix that positions the four levels for ecological hierarchies in relation to the seven levels of development. He also shows how an interior-exterior lens can be combined with an ecological holarchy. This helps us see how much can be lost when limiting ourselves to an individual-collective polarity lens. The resulting table has more granularity than the more commonly used four quadrant framework. Another example that extends our horizons is the combination of social mediation lenses with the developmental hierarchy lens. This expands the focus of attention from internal organizational capacities to also including relational and communicative processes. The use of an alignment lens with a metatheoretical set of integral lenses results in a powerful matrix revealing a range of options for transformation towards sustainability. Edwards concludes this section by providing three different examples of how the spirituality lens can be combined with other integral lenses. Table 8.6 lists the 24 integral lenses and how they frame organizational sustainability, revealing a rich and powerful set of possibilities for understanding and developing action.

Now, with our brains thoroughly stretched, Edwards takes us over the edge, putting together a complete integral metatheory for organizational transformation. He begins by highlighting the centrality of the holarchic group of lenses, which include the intra, inter, systemic holonic and inter-systemic orders. He then uses a series of diagrams to illustrate the very abstract frameworks created through the process of applying these lenses. First, he shows how bipolar lenses and cyclical lenses can be applied at the intra-holonic order. Then he illustrates relational lenses applied at the inter-holonic level. Another illustration addresses how the holarchic lenses can be applied at the systemic order. Finally, a table shows the inter-systemic order for describing metatheoretical lenses, focusing on the matrix created by running the stakeholder lens across the perspective lens. As can easily be seen, the "integrative metatheory described here opens up a more generous landscape for theorising about transformational change" (p. 196).

Coming down from these dizzying heights, chapter nine takes a reflective look at the work as a whole. In *Evaluating the Big Picture*, Edwards takes on the task of critiquing his own work. He shows how "depending on its scope, metatheory can be used to compare and contrast highly abstract ideas across many different theories and research paradigms" (p. 197). To illustrate, he begins by drawing on the health-pathology lens to examine various forms of partiality in the different categories of lenses and how they are commonly used. He then examines reductionist forms of holarchic lenses, such as abbreviation of the number of levels in a lens or exclusion of the higher/deeper aspects or stages such as the spiritual. His examination covers a number of common issues found in the use of these theoretical lenses.

Then the task of evaluating the integral metatheory he has created is approached by drawing on "three sets of criteria … (i) Ritzer's criteria for assessing the quality of metatheorizing projects, (ii) Wacker's "virtues" of good theory and (iii) Whetten's criteria for theoretical contributions" (p. 206). This review and critique reveals various areas where the criteria are well met and others where limitations of time, resources, or space have left gaps and point to areas deserving further work. It becomes clear that new variables or lenses have been created from this work, adding value to the field through extending the range of options available for both explanatory uses as well as creating interventions in systems. The final criteria examined looks at the underlying assumptions informing the position taken, that of an appreciative and inclusive stance, and application of principles of unfoldment and enactment. The value of these stances is highlighted in relation to a model that does not include them, showing how that model has not sustained and evolved its contribution to the field over time due to the lack of these positions.

Next, Edwards takes on the task of critiquing Wilber's AQAL framework. True to his principles, this is an appreciative critique, aimed at contributing to the ongoing work of developing the AQAL framework. He identifies discrepancies between the lenses developed through his methodical approach, (compared to as noted earlier Wilber's more traditional scholarship approach), as well as differences in lens relationships, flexibility, and definitional issues. He highlights specific definitional issues and the lack of comprehensive inclusion of lenses drawn on, but going beyond the five core AQAL ones (quadrants, stages, states, lines, and types). A table highlights formally-included lenses, ones used but not included, and conceptual lenses not found at all in the AQAL framework. Another critique involves lens relationships, where "certain perspectives are associated with certain quadrants despite there being no metatheoretical evidence or logical necessity that this is the case" (p. 219). Edwards then illustrates this with a table showing a non-reductive application of perspectival, interior-exterior, and ecological level lenses. With these examples it becomes clear that this integral metatheory is powerful.

After all of this work, we are taken in chapter ten *Towards an Integral Meta-Studies*. This is introduced by an illustration of how Charles Darwin pointed to the significant range of ideas preceding and contributing to his own work. By doing this, Edwards clearly situates his own work as primarily being involved in taking a wide range of existing, although somewhat implicit sets of knowledge and explicitly (as well as methodically) showing the implication and benefits of putting them together in a comprehensive and integrative framework. The landscape he surveys includes showing how various fields have already developed degrees of meta-studies, such as in sociology. He illustrates how theory, method, data, and interpretation sit on the foundation of primary empirical observation and experience, while meta-theory, meta-methodology, meta-data analysis, and meta-hermeneutics sit at the next level. Taking all of these in together creates the field of integral meta-studies as a whole. This model helps to situate the various aspects and keep some from encroaching on the domain of others (such as how meta-hermeneutics ventures into making claims about what is possible in terms of meta-theorizing).

Drawing on this model, Edwards shows how his own work in developing an integral metatheory for organizational transformation could be followed by similar work in developing meta-methodology, meta-analytical, and meta-hermeneutics in this area of study. He then briefly looks at how from this integral meta-studies perspective current global issues can be reframed from crisis to opportunities. This leads to closing remarks on the power of big picture which takes us full circle back to the beginning of this work. The need for powerful, flexible, and practical big picture thinking is as germane today as it has ever been.

Remarks

Now, if reading over this brief description of Edwards' work has not left you reeling in appreciation of how he has laid out a platform for extending work in multiple domains, then either you were sleeping while reading, are a hidden genius we have not heard from, or I simply have not done a good enough job of giving you a taste of Edwards' work and you will have to read it for yourself (you should anyway). As I struggled to find ways to present enough of the work to show the depth of thought behind it, I found myself coming to even greater levels of appreciation for it.

My appreciative stance towards the work arises from several sources. One is as mentioned in the introduction, that having studied the field of organizational leadership and transformation, I found the organizing power and clarity of the metatheory crystalizing various lines of thought I had not been able to pursue previously. Recalling Nathan Harter's philosophically oriented overview of leadership studies *Clearings in the Forest,* I felt like I had been taken up for a ride in a helicopter and could now make out the terrain. I could see the forest for the trees, make out different kinds of terrain and their relationship to each other, and zoom in for a more detailed look almost anywhere I choose. I feel empowered by a feeling that I can find more appropriate and powerful lens combinations to suit a much wider range of situations I encounter in trying to both teach in the classroom and provide practical training and consulting in the corporate environment.

A second source of appreciation is reflecting on the work of my own dissertation in relation to Edwards' work. Not only my own work, but the many dissertations I have been fortunate to serve as a reviewer for. I have read many excellent dissertations, many of which do what good dissertations do, break new ground in a field. Yet Edwards work goes beyond this by breaking ground in multiple fields at the same time, (i.e., developing a methodological foundation for the development of integral metatheory as well as significantly expanding the domain of knowledge about organizational transformation), creating a generative platform to enable future work for scholars in multiple domains for a long time to come.

A third source of appreciation, (and I'll stop soon enough), comes from having one of my core values fed. I love to learn. When I can encounter a situation where I can learn something, I dive in and am likely to suck as much of the essence out of that situation as possible. If I'm not learning, I don't feel alive. So I appreciate Edwards' work because it taught me so much, on so many levels.

Now, does all this mean I have no critical perspectives to offer? When I take the time to absorb this work and reflect on it, a variety of elements come into focus for me as areas that could be inquired into. For example, I am stimulated to enter into dialog about how different views (drawing on Roy's (2006) distinction between view and perspective in her *Process Model of Integral Theory*) of the nature and purpose of our existence here in this world could impact the ways in which metatheory in a given domain might emerge. But those are thoughts for later conversations.

For now, I will conclude by saying that if you are interested in metatheory, organizational transformation, sustainability, great examples of clear and thorough writing, or just like to gain a view from a profound set of perspectives, then get and read Mark Edwards' *Organizational Transformation for Sustainability. An Integral Metatheory*.

Review of Hope for Humanity: How Understanding and Healing Trauma Could Solve the Planetary Crisis.

(2011) Malcolm Hollick and Christine Connelly. O- books. England.

Joan Wilmot [1]

Hope for humanity: How understanding and healing trauma could solve the planetary crisis, by Malcolm Hollick and Christine Connelly, is an extremely helpful book in that it invites us to look at ours and others' behaviour from the perspective of trauma.

Early on they say, "Trauma warps our personality, blights our health, stunts our development, and condemns us to living well below our potential, both as individuals and as a species. Yet it is so widespread and embedded in our culture that we do not recognise it, and accept our traumatised way as being normal."

They further state, "We believe that our planetary crisis is the result of trauma." In the course of the book they look at the causes of trauma throughout history and also show how trauma is compounded and passed on by the lack of acknowledgement and recognition. They notice, in not recognising that often as human beings we are in a state of shock and trauma, we perpetuate trauma both on ourselves and on our own people as well as our enemies, generation after generation.

I very much agree with them both from my own personal life and in my work as a psychotherapist, supervisor (work mentor) and trainer. I have come to believe the unacknowledged shock in ourselves leads us in our day-to-day conversations and transactions to both shock ourselves and the people with whom we come into contact, and to being more vulnerable to being shocked by other people. I think these every day exchanges probably cause more traumas for most of us in a semi-conscious, unrecognised way and in the way they accumulate over time, than obviously traumatic events. This is probably because our collective understanding has moved on in the last hundred years of recognising the effect of large-scale disasters and the need to attend to people who have suffered them.

I invite you, as do Malcolm and Christine in their book, to consider trauma to be at the root of our disease. You might do this the next time you are in, or witness a conversation, in which people are raising their voices, or getting tense or are uncomfortable, to consider that there may

---

be some element of shock or trauma in the mix, and that in holding that perspective it gives you better options for being present and dealing with it.

As a psychotherapist I have also found this to be true. When sometimes I have asked a client if they might have been in a state of shock when they have been struggling to come to terms with, understand, and move on with a distressing situation in their lives, it is as if a light bulb has gone on. I see their eyes clear, their breathing relax, they come out of the shock and back to themselves. I find then, as trauma therapist Peter Levine says in the prologue, “Not only can trauma be healed, it can be transformative.” Malcolm and Christine demonstrate how the recognition and understanding of trauma in our daily lives evokes compassion for us, our fellow human beings and our world, which then forms the ground for healing.

The book is divided into four parts and the following summary is taken from the beginning of their book. They start in Part I with a description of the nature, causes and impacts of trauma. This is followed in Part II by a discussion of the characteristics of the human brain and mind that distinguish us from other animals, and make us more vulnerable to trauma.

In Part III, they trace key aspects of the evolution of human culture from hunting and gathering to the establishment of agriculture. They present the theory that despite a potential for trauma, the evidence suggests that

> we maintained a largely peaceful, cooperative and egalitarian “partnership” culture for tens of thousands of years and that it was not until about 6,000 years ago that human culture changed. At that time, the climate dried dramatically over a huge belt of latitudes stretching round the globe. In its wake came famine, conflict and trauma, followed by an equally dramatic cultural discontinuity that Steve Taylor called “The Fall.”

The events of *the fall* are described in Part IV, together with discussion of its causes and consequences, and reactions to it. Part V examines in detail the incidence of trauma in the world today, from before birth to adulthood, and from the individual to whole societies.

I found the first five sections of the book the most useful even though I had some reservations about the fall theory. The development of their thinking is thought provoking, clear, compassionate, and informative and expands our understanding of our human condition practically, psychologically and spiritually. It does this both in terms of our concerns for ourselves and our own health and healing and also from the wider perspective of our immediate family, our extended family, our tribe, and to the global perspective of our nation and the planet. The book moves the reader through what in therapeutic terms is known as the “drama triangle” (Karpman), that of experiencing the world from the perspective of the roles of “victim,” “persecutor,” and “rescuer.” This is a cycle that endlessly repeats itself. However, through the perspective of understanding and compassion it shows how we can move from the drama triangle to the beneficial triangle of *vulnerability, potency*, and *responsiveness*, which naturally leads to healing.

Finally, in Part VI they set out a strategy for changing the course of history from domination to partnership, and encouraging the “emergence of the possible human.” I personally found this part of the book the least useful, or perhaps a better term would be, least necessary. Once the word “must” begins to appear regularly, as it did in this section, fear has probably re-emerged and with that, a contraction. It is not surprising given the subject matter of the book that the process would play out in the book in some ways and through the authors. They said as much themselves. As Malcolm and Christine reached the end of the book maybe the fear that its message would not impact the reader enough built up a rush for, and pressure for, strategies and solutions, which I found less informed and interesting than the rest of the book.

When a shift in consciousness or a different way of looking happens, which I think the book invites us into, the next steps naturally happen. You can trust the individual and the group and in this instance the book! Enjoy!

Political and Civic Leadership: A Reference Handbook

Edited by Richard A. Couto (2010) Thousand Oaks, CA: Sage Publications Inc.

Review by Jonathan Reams[1]

In his introduction to the handbook, Richard Couto indicates that he was motivated by the lack of good, recent material in the field of political and civic leadership that scholars and teachers could use to engage in dialogue about this topic as something more than authority and hierarchy. As well, he states an aim of bridging a gap that has existed, where leadership does not want to get its hands dirty by discussing politics and political science avoids the embarrassment of leadership. Making politics, civic life and leadership relevant for a wider range of people is a worthy ambition. Giving future students of both subject areas a rich resource to understand the core issues, this handbook offers a benchmark and starting place for future efforts to understand the practice of leadership in politics and civic life.

This is indeed a handbook on leadership. The scope of work included is comprehensive. With 120 chapters, it covers just about everything you could imagine in relation to political and civic leadership. It does not attempt to be comprehensive about leadership, steering clear of areas such as business and organizations. The 11 parts to the two volume set cover a range of topics clearly focused on politics and civic life such as philosophy and theories, purposes, failures, processes, institutions, contexts, psychology, tasks and tools, and finally depictions.

From this vast collection of material, I choose to focus on a few names known to me to get an indication of the flavor, tone and substance of the volume. From Part I, *Introduction to Politics and Civic Leadership*, I read the first three chapters, *Politics* by Richard Couto and *Leadership* and *Leadership and Values* both by Ronald Heifetz. From Part II on *Philosophy and Theories of Political and Civic Leadership* I read chapters seven, on *The Hero Myth* by Betty Sue Flowers, *Social Origins of Authority* by Nathan Harter, and *Integral Leadership Theory* by Russ Volckmann. I will attempt to provide a brief overview of the approaches and contents of these chapters, make a few remarks regarding them and some summary remarks about the impression they give of the volume as a whole.

Couto starts off his handbook by introducing his view of politics through the story of a young soldier he met on an airplane trip who disliked politics because in her experience it was primarily about the abuse of power. It serves to illustrate the common view wherein “Politics … equals hypocritical self-serving and inequality of freedom among different groups” (p. 3). This allows Couto to draw his initial broad lines on the subject, that in essence politics is about power to make and enforce decisions, requires legitimation and that this gives authority to thus use power.

The chapter then goes on to lay out how these core constructs of legitimacy, authority and power have been viewed, shaped and used in society.

After going on to lay out the hidden dimensions of power involved Couto begins to point towards a "new politics of truth" (p. 7). This takes us through the territory of narratives on the collective good. "Power established regimes of truth about the nature of community, who belongs and who does not, and the legitimacy of the claims that communities can make upon their members for the goods and resources to produce and sustain it" (p. 9). This brings him to politics as leadership, rather than politics as power. In this, he shows that we each have "a degree of responsibility to advance narratives we prefer as true and just" (p. 10). Thus politics is indeed personal.

I came away from my reading feeling educated about the realities of how civic or community life is inherently impacted by politics and the political and how we live and act in those domains with or without knowing it. The depth of complexities of how the issues of power, legitimacy and authority are woven into the fabric of our lives comes through well and sets the stage for the volume that follows.

I then turned my attention to Heifetz's chapters on leadership. Having long been a student of his work, I was looking forward to see how he might synthesize his work in a short chapter. He begins by clarifying the distinction between leadership and authority, both formal and informal. His analysis clearly decouples these conceptions, leaving the way open to find more viable reference points for the leadership. He does this by pointing out that "Most problem situations do not call for leadership. Authoritative systems are sufficient" (p. 14). Yet when situations demand adaptation from a group or community, the tried and true authority systems most often fail, leading to a need for something more – leadership. Using this reference point, Heifetz is also able to make a clear distinction between leadership and management. In his frame, management refers to "the activity of coordinating complex systems in the efficient production of solutions to routine or technical problems" (p.14).

Understanding how to recognize adaptive challenges and decoupling leadership from authority enables Heifetz to analyze a number of questions relevant to understanding the practice of leadership. This includes leadership with or without formal authority. He illustrates how this can look with stories both familiar and new, large scale, at a community level and within a family system. This allows him to make clear another distinction, that leadership is not a personality trait, but an activity.

In his brief chapter on *Leadership and Values,* Heifetz makes a clear case for leadership being an inherently value laden activity. He examines James MacGregor Burns' conception of transformational leadership and finds that it falls prey to at least three issues related to the normative values frameworks it implies. Heifetz addresses this by proposing to go "further by building a normative conception of leadership that starts with the work of meeting these [internal contradictions in values held by a community] challenges" (p. 26). From this he identifies one of the core tasks of leadership to be building holding environments, or containers that allow for the pressures of those challenges to enable a community to do adaptive work on itself. This work is inherently value laden, but this approach does not prescribe a normative set of values to be sought, but a process for communities to go through the process of creating their own higher order values.

I found that these two chapters summarized the core elements of Heifetz's concepts of leadership in a succinct and well-illustrated manner. As a way of setting the frame for leadership for the rest of the volume, these two chapters do an excellent job. The process or activity of leadership is shown to require a high (if not "integral") level of thought from leaders as they must orchestrate the interactions of multiple complex systems of values through a collectively reflective process. This is a tall order indeed, and maybe shows why in public life we feel a real lack of—and thus cry for—leadership.

This lack of leadership may be connected to the deeply embedded view of leaders as heroes, which is the subject of Betty Sue Flowers chapter on *The Hero Myth.* She begins by laying out the four part structure of such myths; the call, crossing the threshold to adventure, facing a supreme ordeal and returning with a gift. She then points to how the hero myth has been and is currently used in leadership literature, from which there are many examples to pick. While many of these examples can be viewed as not the best examples of the kind of leadership called for by today's thought leaders, she also shows how the hero myth can illustrate a leader's journey in a positive way.

In line with many current views, Flowers then points out that the "hero myth is fundamentally individualistic" (p. 58). The shortcomings of the hero myth are shown in light of understanding how many leaders contribute to enabling the success of the leader who is mythologized. She also shows how the hero myth can marginalize women's roles. In the end, while noting that the popularity of the hero myth of leadership will continue "as long as we find tales of individual heroes more compelling than tales of groups or systems" (p. 59). Flowers points out that the "problems of this century's complex, globally interconnected world are unlikely to be solved by individualistic heroic leadership" (p. 59). This then brings us back to the gap that is felt today for leadership that goes beyond conventional mythologies embedded in our society.

Nathan Harter follows next with his chapter on *Social Origins of Authority*. In his usual thorough philosophical style, he digs deeply into the ways in which followers willingly constrain their choices by granting authority to others. After showing the blurring boundaries that exist between rulers and followers, he digs into the motivations of followers. This reveals that such motivation for giving authority is dynamic, ambivalent, paradoxical and often a group phenomenon. All of this is further compounded by a set of nonconscious factors such as habit and subconscious influences. Here Harter draws on Freud to illuminate the depths of how such issues can influence the granting of authority.

In further investigating his theme, Harter moves from authority to legitimacy. "Authority is a residual sentiment, a sense of legitimacy rooted in a present day belief adopted previously" (p. 65). He then draws on Weber's three sources of legitimacy, rationality, tradition or charisma and Mary Parker Follett's ideas to flesh this out. After this journey through the social sources of authority Harter ends with the kind of phrasing that simplifies the complexity: "People want rulers for conscious and unconscious reasons, but at the same time, they also do not want them, or they go for long periods of time when they do not really think about it" (p. 67). Such is the reality faced by leaders and those trying to put attention on these issues.

The final chapter I choose to review is Russ Volckmann's *Integral Leadership Theory*. For readers of this journal, the inclusion of this topic being relegated to one brief chapter might seem a loss of the potential perceived for it to contribute to the field. However it can also be viewed as an achievement that the topic is included in such a mainstream handbook. Then there is the daunting task facing Volckmann of trying to do justice to the topic in roughly six pages. He begins by noting that integral is used in two main ways; first as a stage development theory, second as a meta-theory. He does a good job of explaining both and showing how each of these usages of integral can contribute to leadership studies. He even gives some nice examples to illustrate the concept of holons.

Volckmann goes on to show how integral (meta)theory can be useful as a framework in mapping the breadth of disciplinary concepts related to leadership. He demonstrates the utility of the integral model in providing categories that lend themselves to sorting various models and concepts of leadership. In addition he covers how various methods can be drawn on to enable an organized and coherent methodological pluralism. He also surveys the growing body of research and publications bringing the application of integral theory to the field of leadership studies. In pointing to the future of how this can be used, he notes that "these elements of the theory are used as mapping tools designed to help us learn more about the relationship between multiple intelligences and the capacity of individuals to handle higher and higher levels of task complexity" (p. 126). He closes by noting that this is a lifelong task of constantly learning, not only specific skills, but learning to develop the whole person in an integrated manner.

I believe that this chapter exemplifies the challenge that integral theory faces in making its contribution to leadership studies in general. Brief overviews must necessarily suffer from truncated explanations that cannot do justice to the depth and complexity that is possible. The devil is in the details, and to realize the potential of integral theory requires a significant investment of time and energy, not to mention word counts. In contrast to some of the other chapters surveyed here, whose themes are relatively focused, Volckmann by necessity must cover a broad scope to begin to convey the topic.

Having now surveyed a small handful of chapters of this handbook, I can give some overall impressions based on that selective reading. First of all, I believe that if the rest of the volume carries on with the level of writing displayed here, that it would be a worthy investment. It is a reference volume, not designed to break new ground in the particulars, but in the whole by addressing head-on the gap in the literature about political and civic life in relation to leadership. It appears to meet the goal set out by Couto in his introduction. To then remedy this gap by gathering a very thorough and comprehensive set of scholars to provide rich descriptions of the multitude of issues involved demonstrates the passion and commitment Couto brought to the project.

This Way, Please!

Review of Edgar Morin's book "La Voie. Pour l'avenir de l'humanité." 2011. Paris: Fayard.

Michel Nguyen[1]

What the Book is About

In his last book and essay "La Voie" (*The Way*), Edgar Morin shows us the way, for the future of humanity (reference to the subtitle), and even the Way with a capital letter: in French the words in titles do not have to be capitalized, which shows how ambitious the book is. It deals with most of the aspects of today's human crises: politics, civilization, democracy, demography, indigenous peoples, water, economy, inequalities and poverty, bureaucratization, justice, thinking, education, medicine and health, urbanism, agriculture, food, consumption, work, life, family, the feminine condition, ages of life. Edgar Morin makes a diagnosis in all those areas and suggests many reforms on mostly political levels, but also to some extent on the civic and individual levels.

Who is this Book for and What is the Purpose of the Book

Paradoxically, the book is written on the political level, but it is not specifically written to political people. Rather, it is written for a large public, be it political people, intellectuals, engaged people, laypersons. This is to compare with “Le pacte écologique” (*The Ecological Pact*, 2007) from Nicolas Hulot which begins with an open letter to the next President of France.

It is a synthesis of all ideas that Edgar Morin has defended all his life. It can be understood as a political, philosophical, and human act aimed at a large public. It is an invitation to think about all the issues together. Everyone can have an overview of a new vision of politics in general at the civilization and human levels. An ecologically minded person can have an overview of the issues of economics and education and how they have an influence on ecology. An intellectual can learn about practical initiatives virtually unknown in France.

This book may also be considered only as a draft of what the Way should be about. Edgar Morin explicitly invites readers to point out gaps and inaccuracies in his book. He introduces his book only as a first version that should be followed by a second volume written by a committee.

Aim of this Review

As this review is aimed at international integral-minded readers, its writing situates the book in the context of France, both in her history and the sociology around the book. I will not only put this book in perspective with Edgar Morin's life and work but also more generally with the transdisciplinary and integral communities in France and in the world.

Gramps Is in the Resistance! French Resistance as a Third Way Between Nazism and Stalinism

As Edgar Morin puts it himself, this book was written out of "infinite solidarity.. This means the book should be first received as a message from an exemplary man to our hearts. Born in 1921, Edgar Morin was taken in by the maelstrom of the Second World War. Not only did he enter the French resistance, but he also entered the communist party at the age of 20 because of its political ideas. As a resister he made a point not to fight Germans in general, but only Nazism. As a communist he always made the difference between his ideology and Stalinism. Actually, in the introduction of the book, Morin presents his enrolment in the French resistance as a third way between Nazism and Stalinism.

Though Morin speaks very little of himself in the book but in the short preface, this past of resistance is quite important as the book appeared in France at the same time as "Une si vive résistance" (*Such a fierce resistance*, January 2011) from 89-year-old banker Claude Alphandéry, who developed the social and solidarity economy in France, and the best-selling three-euro short book "Indignez-vous !" from 93-year-old diplomat Stéphane Hessel (more than 950,000 copies of this last book have been sold). As for "La Voie," it can be found in the top-selling shelves of bookstore chains, though one cannot find it in the bookshop sections of supermarkets. The authors are often invited together in conferences or TV and radio shows, and when not, they make reference to each other. Morin wrote the preface to Alphandéry's book. Stéphane Hessel says that people who liked his book and need philosophy and ideas for action should get Edgar Morin's book. The pun "Les papys font de la résistance" in reference to the French comic cult movie "Papy fait de la résistance" ("Gramps Is in the Resistance," 1983) is often made in articles, radio and TV shows about these three people, asserting that old people today still lead the way for young people. Edgar Morin's conferences are always full of people among whom the young ones are clearly eager to listen to the voice of philosophy.

One can all the more appreciate the reference to a movie when one knows that this movie starred famous actors, even in secondary roles, and that Morin started his career in the sociology of movies. He wrote a book about movie stars, namely "Les Stars" (The Stars, 1957). As he often says, we as spectators are often able to get the complexity of people and situations in movies, but forget about this complexity in real life situations.

This indignation still meets some resistance today. The show starring Stéphane Hessel, Claude Alphandéry and Edgar Morin that was supposed to take place on France Inter on January 16th 2011 and that many people were eager to hear was cancelled two days before for unclear reasons. In the same vein, a conference of Hessel on January 18th was cancelled on January 10th because of Jewish lobbies' opposition to Hessel's pro-Palestinian stance. This is reminiscent of how

Jewish lobbies such as Avocats sans frontières and France-Israël harassed the nevertheless Jew Edgar Morin, when he co-wrote the article "Israël-Palestine: le cancer" in Le Monde, June 4th 2002, stating that one people, namely the Jews, who have been subject to massacres, do not have the right to become in its turn a perpetrator.

Edgar Morin, a Unique Voice in France

In French, "voie" is homonymous with "voix" meaning “voice.” When one says "La voie/voix d'Edgar Morin" aloud, it means at the same time Edgar Morin's way and voice. Edgar Morin's voice has a lot of power and influence because he is a public intellectual who always has tried to write texts that are simple to understand. They remain hard to read for the “man in the street” but at least they convey very important ideas.

Morin might well be the only French transdisciplinary thinker who is neither a scientist nor a full time philosopher of sciences. He had to find ways to acquire a scientific knowledge that is impressive. As a French resister he has a lot of credibility. He has a lot of knowledge of classical philosophy, of literature, and especially in history and politics where he also has a lot of insight. Other French transdisciplinary thinkers would find it very difficult to answer with accuracy, pertinence and in a useful way questions from a politically oriented journalist. In the field of philosophy of sciences, he had to learn and understand sciences from scratch.

He also developed a few ideas of his own. He was one of the first to speak about the notion of amortality when it was only a highly hypothetical prospect for biologists. The typology of causalities he developed in his Method with a scientific basis proved to be prominent in the writing of the purely political book “Penser l’Europe” (*Thinking Europe,* 1990).

First Reactions to the Book

Edgar Morin's book has already met a tremendous success given the reactions that can be found in the public, on TV and radio shows, in reviews that can be found on the Internet and in journals. It is always an honour to welcome Morin in conferences in every circle, and his mere presence attracts a lot of people. There has been very little feedback about the book from intellectual and political people as yet.

Genetics of the Book

In many ways, “La Voie” can be seen as a compendium of Morin’s work. He has written so many books and articles that it is impossible to mention even all the important ones. Nevertheless, one can see the political side of Morin in “Penser l’Europe” (*Thinking Europe*, 1990) and “Politique de civilisation” (*Politics of civilisation*, 1997). The ecological side can be seen in “Terre-Patrie” (*Homeland Earth*, 1993, written in collaboration with Brigitte Kern) and “L’An I de l’ère écologique : la Terre dépend de l’homme qui dépend de la Terre” (*Year One of the Ecological Era: Earth depends on man who depends on Earth*, 2007). The educational aspect can be seen in “Les Sept Savoirs nécessaires à l’éducation du future” (Seven complex lessons in education for the future, 2000). The call for a transdisciplinary knowledge can be found in the four first volumes of “La méthode” (*The Method*) and the subjects of humanity and ethics are dealt with respectively in the fifth and sixth volumes of The Method. Spiritual aspects can be seen in “L’homme et la mort” (*Man and Death*, 1951) and “Amour, poésie, sagesse” (*Love, poetry, wisdom,* 1997). The planetary aspect can be seen in “Terre-Patrie” mentioned above and in “Pour sortir du XX^{e} siècle” (*To get out of the 21st century*, 1984) and “Vers l’abîme” (*Towards the abyss*, 2007). It is interesting to see that all those themes were already present in Morin’s early works. For example, in “Journal de Californie” (*Journal of California*, 1970), he was aware of the ecological issues before the Club of Rome report was published. There are many biographies of Edgar Morin, but “Mon chemin” (*My Path*, 2008) is quite symmetric with “La Voie,” both in title and in contents. While Morin scarcely speaks of himself in “La Voie,” “Mon chemin” is a set of interviews about his life. “La Voie” deals with an impersonal future, while “Mon chemin” deals with a personal past.

Short previews of the book can be found on the Internet, especially on the website of “Dialogues en humanité” (http://dialoguesenhumanite.org/331-la-voie-edgar-morin). A similar preview version in the form of an article, already entitled “La Voie,” can be found in the book "Prospective d'un monde en mutation" (*Forecasting of a mutating world*, 2009) edited by Carine Dartiguepeyrou, which contains articles of members of friends of the Club of Budapest France, the association that organizes the events of the Integral University of Paris.

An important event that is not mentioned in the book was the summer university that took place in Poitiers from 27th to 30th September 2010 on the very topic "changer de voie" ("changing paths" http://telem.fr/UIE10/uie2010). Five different circles dealt each with one of the following themes: the political challenge: challenge of a policy of humanity; the ethical challenge: relation ethics/politics; ecological challenge: water and biodiversity; the challenge of the nourishing Earth; the challenge of knowledge: the challenge of complexity. Morin had a leading role, as he concluded the event after the syntheses of the circles. This event shows that Edgar Morin does not work on his own and probably had this kind of committees in mind when he wrote at the beginning of “La Voie” that it needed a second volume written by a committee.

The book remains a one-author book, though Edgar Morin had wanted to write it with Marta de Azeivedo Irving from Brasil. Two chapters were written by sociologist Sabah Abouessalam. A lot of documentary material was provided by Karima Abouessalam.

Organization of the Book

The book is organized in four parts: the policies of humanity; reforms of thinking and education; reforms of society; reforms of life. The parts are of unequal size, comprised of twelve, three, six, and seven chapters, respectively. Many chapters, be they in the first part or in the following ones, begin with a description of the situation and a list of reforms. The first part contains at the same time general and more precise themes and loosely the pattern of a general theme followed by a subtheme. The first three chapters on politics (political thought, politics of humanity, politics of civilization) are followed by a chapter on democracy. Chapter 5 on demography is followed by a chapter on indigenous peoples. Chapter 7 on the ecological way is followed by a chapter 8 on water. Chapter 9 on the economic way is followed by a chapter on inequalities and poverty.

The issues are intertwined, so a similar subject can be dealt with in different chapters. For example, in part 3, chapter 1 on medicine and health, he speaks about reforming the content of medical studies (pp. 177-178), which should contain courses on psychosociology and sociology, on civilizations and complexity. A corresponding paragraph makes the link with the reform on education in part 2. Examples of communities such as Auroville are given in different chapters, namely p. 207 in chapter 2 on “Ville et habitat” (town and settlement) of part 2, and p. 272 in chapter 1 on the way of the reform of life of part 4.

In a holographic way, a few chapters are richer than others and encapsulate the issues of the others. The chapter on the ecological way deals with capitalism, housing, water, policy of civilization. The chapter on agriculture and country deals with demography, urbanism, global governance, globalization and de-globalization, education on food and consumption. These resonate with many other chapters of the book.

A Critical and Synthesizing Mind

On each subject, Morin tries to identify what is good and what is not. He calls for a symbiotic way between the occidental society (critical mind, human rights…) and traditional societies (inclusion in the Cosmos, social and community relationships).. For example, in the chapter on medicine and health, there is a great emphasis on alternative medicine, both in the occidental and oriental or traditional societies, and he reports (p. 179) that he resorted to the Mezières method, an alternative physical therapy. He is fascinated by shamans who have psychic and spiritual powers and believes that they should be taken more seriously by occidental people.

As for the economic advocates for development and the ecological mainstream for sustainable development, as far as he is concerned, the very notion of development should be questioned, even when sustainable. He balances the idea of development with the notion of envelopment, which implies returning to more interior values, having an interior life, putting more love and understanding in our relationships with other people.

Simplicity and Rigor

Morin is known to fight for self-critics and even wrote a book on the topic. Nevertheless, there can be generalities that forget the complexity and singularity of situations.. In a book of this scope, it is necessary not to focus on details and leave the big picture behind. Otherwise, even if it might be clear in the author's mind, a few ideas with too short wordings may not be understood. When he says that economy is not controlled and regulated, it is in fact from a global and almost biological point of view. A professional economist would tend to disagree, in so far as there are many controls and regulations everywhere, especially fiscal ones. As a matter of fact, many liquidity problems may result from too much regulation. An enthusiastic anticapitalist idealist would agree with Edgar Morin. He would agree with the sentence but would only partially understand it. Yes, in the end, greed is not regulated, but in the details regulations can prevent investors from putting money in projects where some risk is unavoidable.

There are issues for which Morin did not investigate as deeply as seems desirable, and this may be interpreted as a lack of rigour. In the chapter on the ecological way (pp. 86-87), he advocates for renewable energies and mentions several of them (water, wind, solar, photovoltaic, geothermic and tidal energies). He says that they should be combined, but he does not take into account the life cycle of these technologies. In a footnote (p, 87) he mentions a project of a photovoltaic factory in Paris. Many specialists think that photovoltaics in France is only greenwashing, given the weak energy return and greenhouse gases emissions, if one takes into account all the rare metals needed, the transports, maintenance, and taking care of the garbage. Besides, in the end, the notion of renewable energy is still a dream and there is no known renewable energy today. Like sustainable development, the notion of renewable energy should also be questioned, in the view of this reviewer.

Edgar Morin in the Transdisciplinary World

Morin's situation and role in the transdisciplinary world is more complex. Through his articles and books, his involvement in associations such as MCX-APC, groups such as Le Groupe des Dix, Edgar Morin had been in touch with basically all the transdisciplinarity-oriented minds in France. He is also very active and recognized in foreign countries, especially in Brazil, and involved in CIRET in so far as he is an active member of the association: he and Basarab Nicolescu were the cowriters with Lima de Freitas of the manifesto of transdisciplinarity of the CIRET. In his *Manifesto of Transdisciplinarity*, Basarab Nicolescu defines the three pillars of transdisciplinarity as being levels of Reality, the logic of the included middle, and complexity, in which we see again Edgar Morin's influence with the word complexity and an implicit acknowledgement of the two other pillars.

Now indeed Morin does use the three pillars, but dialogics is in fact a flattened version of the logic of the included middle, as Morin maintains the distinction without giving it a name and explicitly giving it room enough in another level of Reality.[2] The use of level of Reality is implicit and he does not try to generate new levels of Reality. An example of this is that as far as he is concerned, the gods are mere creations of the human mind. He grants gods, ideas and imagination a form of existence and reality which might even supersede the material reality and have some control of humans, but only conditionally to the existence of the people that produce them. In this respect, Edgar Morin belongs more to the systemic thinkers who do include a form of sacredness and spirituality in their systems through ethics, poetry and culture, but who have not fully adopted a transdisciplinary ideology.

These discussions would deserve further development and more nuancing, but another hidden idea in Lupascian logic is that it presents a natural side and a cultural side, which are supposed to be isomorphic. Even if again this can become conceptually quite messy and fuzzy, there is a philosophical ambition to uncover some logics binding together the human and nature, science and religion. One can find traces of similar ideas in Edgar Morin's work, especially in the Method, but in "La Voie" there are only very pragmatic ideas about reforming our knowledge. Our relationship with the Earth should change our way of living and inhabiting it, but not our vision of Earth. The reform of knowledge insists on reliability but tells nothing of the awe of science and of the philosophical, poetic and mystical aspects of science.

---

[2] The expression "logic of the included middle" is no better in so far as it is in reaction to the first two principles it is supposed to transcend. Nicolescu often makes the distinction between the third term which is simultaneous to the first two terms, and the Hegelian synthesis, representative of the first entropic term, which is supposed to subsume the contradiction at a later time. Nicolescu also makes a distinction between the notion of level of Reality, representative of the third term, and the notion of level of organization, representative of the negentropic second term. But then he does not rearticulate the three logics in one concept. Like the three matters of Lupasco, he puts more stress on the third term and finally on transcendance, which is a biased point of view not in keeping with the transdisciplinary ideology.

Edgar Morin and (French) Transdisciplinarity in the Integral World

The situation of Edgar Morin in the integral world is simpler to analyze. Even though Basarab Nicolescu is on the advisory board of the *Integral Review* and is also often cited in the *Integral Leadership Review,* a huge difference between transdisciplinarity and the integral approaches as they are sociologically practiced concerns the fields of personal development, spirituality and the evolution of individuals and humanity. There is a spiritual gradient between systemics, Edgar Morin, transdisciplinarity and the integral approaches. Though Morin advocates for personal development and meditation in “La Voie,” these topics are only casually mentioned in a few sentences and very little emphasis is put on them, which can also be seen in his life and works. There is no philosophical study or practice of personal development or meditation from Edgar Morin or Basarab Nicolescu.

Transdisciplinarity is also self-limited in discarding New Age ideas in so far as it remains human-centered and does not ask what would be the point of view of stones, plants, animals, Earth, and other possible beings. The movie Avatar showed a planet able to think. The idea that Earth could think is a hypothesis that could be considered outside esoteric doctrines and studied by scientists, but it is not discussed. The planetary crisis and planetary consciousness are of no concern for the planet herself, except in Bolivia where people fight for Earth rights. Journalists only occasionally animate the Earth for rhetoric purposes, though it already means a lot from a psychoanalytical point of view. The following paragraph (“La Voie,” p. 85) is very representative of this:

> La prise de conscience de cette communauté de destin terrestre doit devenir l’événement clé du XXI^{e} siècle : nous nous devons sentir solidaires de cette planète dont la vie conditionne la nôtre. Il faut sauver le soldat Terre ! Il nous faut sauver notre Pachamama, notre Terre mère ! Pour devenir pleinement citoyens de la Terre, nous devons impérativement changer notre façon de l’habiter !
>
> …which could translate as
>
> Realizing our common Earthian destiny must become the key event of the 21st century: we must feel solidarity with this planet whose life conditions ours. We must save Warrior Earth! We must save our Pachamama, our Mother Earth! Imperatively, to become fully citizens of Earth, we must change our way of inhabiting it!

Here the essay’s style changes to a style that is between manifesto and poetry. Earth is seen successively as an object, namely a planet, but embedded with life. Then it/he/she is seen as a male figure and a female figure. In the last sentence, it is again seen as an object, as a place where we live. Morin never really quits the anthropocentric reference. Earth is seen as a mother in a poetic or biologic way, in relation to us, but not possibly as a living being at the human level, even only as a hypothesis. Morin speaks for ecocentrism but as seen from an anthropocentric point of view, or put more simply, an anthropocentric ecocentrism. It can be seen as a limited and limiting philosophical and spiritual point of view, but it also is an example of how far one can go with an anthropocentric ethic, and a way to sociologically be successful and appeal to a larger public. This is not a conscious strategy from Edgar Morin so far as he defines himself as a neo-atheist. Pachamama is the Bolivian word to say "Mother Earth," but there is no mention that Bolivians come so far as to elaborating a declaration of Earth rights.[3]

Another area generally left out by French transdisciplinarity is the idea of human evolution, apart from Teilhard de Chardin followers. The ideas of ethics, self-criticism developed by Edgar Morin, are displayed as general and universal. There is no idea of gradiations of ethics and of values or of differentiated readerships for his books. This explains the emphasis on politics. In the same vein, Basarab Nicolescu advocates for transdisciplinarity for everyone and Henri Laborit promotes creativity for everyone. Despite a call for diversity, almost each transdisciplinary thinker has an individual idea of what the meaning of life should be. It is less true for people in personal development who use different typologies of personalities, like the enneagram.

French Disciplinary and Transdisciplinary Work outside the So-called Transdisciplinary Realm

Even if the so-called transdisciplinary communities form a small world, there is a lot of important and good work done in disciplinary groups who do not market themselves as transdisciplinary, although they are very transdisciplinary in themselves. Many disciplines develop cutting edge concepts that may potentially not be less universal as the known transdisciplinary ones. Besides, innovation in action or in concepts does not always have to dwell on self-reflexive transdisciplinary meditations.

Transdisciplinary and integral actors speak a lot about quantum mechanics, but only see it from the outside. They are blinded by superstrings and nonduality—be it logical or spiritual—and do not look into the details of the different internal revolutions encountered by quantum mechanics since its inception.

Even the idea of reliability as developed by Edgar Morin that is at the core of transdisciplinary in many ways did not go as far as the ontology of relations developed by French philosopher Gilbert Simondon (1924-1989), who was Morin's contemporary. Simondon's philosophy gave birth to paradoxically more substantial concepts of identity and individuation, especially through a co-construction of individuals and their environments, rather than through mere dialogics between unity and diversity, interior and exterior. This Simondonian idea is present in Morin's trinitary concept of individual/society/species (individuals, society and species mutually define each other) but Morin did not systematically develop it in the technological or scientific realms such as physics, biology, art, and psychosociology.

---

[3] Many systemic thinkers in France are Christian and may have a strong spiritual orientation, but generally they do not practice meditation a lot and are not interested in nonduality as an embodiment of enlightenment. In principle, Lupasco's logic should allow him to make a bridge between science and spirituality, and a few confidential texts use it to study Buddhist concepts. But in practice it is difficult to judge how promising further development might be, all the more since Lupasco's books are out of print and Lupasco is virtually unknown, hard to read and scarcely translated.

Gilbert Simondon is cited by the philosopher Bernard Stiegler, the prospectivist Thierry Gaudin, and a couple of academic working groups in different areas of philosophy who are rediscovering him outside the sociological groups labelled as integral or transdisciplinary.

Edgar Morin and Death

Death played an important part in Morin's life. His mother was in a very weak condition and tried to abort when she was pregnant, but Edgar seemingly resisted. Her hidden death when he was nine would traumatize him. No wonder he wrote a book about man and death ("L'homme et la mort", 1951) where he explored the theme of death in almost every culture and civilization. In this book, the atheist Edgar Morin writes that immortality is a regression of philosophy. This is a different view from many integral people and cultural creatives who believe in karma. The six-periodic spiral dynamics asserts that it is possible to return to a holistic view of the world and a sense of belonging in the universe that is in fact different from the archaic magic tier. As far as Morin is concerned, the astral and causal bodies are only beliefs, part of the culture of a few civilizations. He does not seem to have a Newton's trunk. The evolution of Morin is evidently different from Ervin Laszlo, for example, who becomes more and more aggressively spiritual and tries to find scientific support for the existence of akashic fields. Echoing his first big essay, the last chapter before the conclusion of “La Voie” deals with death and is explicitly aimed at non-religious people. Morin says that we will all die, our sun will die, our universe will die, but that death should have a more explicit part in our society.

Along similar non-religious lines, the French philosopher Patrick Viveret who co-wrote a book with Morin and who is often mentioned in “La Voie,” argues against the notion of sustainability by citing the fact that we will all die. This shows that our main concern should not be a question of survival, but of having meaningful lives.

Edgar Morin appears to me to have a simple and linear view of life and death, which is fine, but it would have been very interesting for him to try to adopt the view of other people, even as an hypothesis, and use his concepts of recursive loop, hologrammatics, emergence, complexity, to rethink the concept of death beyond the different accounts he gave in 1951.

A Techno-Biased Postconclusion

In the postconclusion of “La Voie,” Morin gives glimpses of what the future of humanity has in store, in the areas of the nature of humanity itself, its relation to cosmos, the nature of knowledge. Although he acknowledges the possible existence of parallel dimensions, of extraterrestrials and of an increase of cognitive powers of the human, he does not make any link with human evolution toward more wisdom, more ethics. He only mentions colonization of planets, a merging of man and technology reminiscent of transhumanism and Kurzweil’s singularity. Regarding the increase of knowledge, Morin focuses a lot on physical aspects like the nature of space and time, but not on the very nature of life and humanity. The author of an article in the French journal *Libération* is happy that Morin's book does not contain any New Age babbling, but even without spiritual beliefs it would have been possible to put forward that humanity is not only a child in the areas of technology and knowledge, but also in the areas of love, wisdom, morality. Morin wrote several books stating that we are only at the stone age of ecology but this is not quite put forward in the end of ”La Voie.”

What to Put in a Volume 2

A natural idea to pursue beyond Edgar Morin's work would be to create a benchmark of initiatives. The book “Des abeilles et des hommes” (*Bees and men,* 2010), from Thanh Nghiem, was written with this view in mind.

We should write “do's and don'ts.” In *The Choice: Evolution or Extinction?* by Ervin Laszlo, there is a chapter entitled “A Short Catalogue of Obsolete Beliefs and Misguided Practices.”

Beyond “do's and don'ts”, one should put them in perspective. A “do” in one context might be a “don't” in another. As a specialist in permaculture would say, there are no bad lands, only bad farmers.

Even the very idea of creating a benchmark of “do's and don'ts” has its limits in so far as many important projects in their infancy are not supposed to be known by everyone. New ideas must be experimented with before being widespread. Ideas that may be commercially exploited must first seek a framework that protects them. A lot of underground work needs to be done at all scales, from crisis areas to the backstage of the highest levels of political decisions or of fundamental research.

Should this Book be Used as a Blueprint?

It is clear that Edgar Morin is representative of a few systemic and transdisciplinary circles in France and possibly abroad, and that these circles could use his work as a blueprint. On a general and practical basis, the book has obvious limitations in layout and contents. We have seen that the different parts of the book are quite unbalanced, and the previous articles also entitled “La Voie” may have more workable and straightforward layouts. As far as content is concerned, the book does not exhaust all the topics developed in Edgar Morin's work, it is not representative of all the integral developments in France or in the world. Besides, a basic model like Wilber's eight zone quadrants analysis shows that even if Edgar Morin's work spans the four quadrants, there is an emphasis on holons seen from the outside, so that despite Morin's notion of envelopment, the book would not fit people spiritually oriented.

Trying to take into account all the integral and transdisciplinary approaches as does Jennifer Gidley is a very important work, but such a synthesis should also exist in different variants according to people's personalities, contexts and goals. Stating conceptual and practical integral traps and impossibilities should also be important.

Conclusion

Edgar Morin is a very generous man who during his whole life has been showing us the way. As a systemic atheist with a mystical poetical facet, he does not seek or sell enlightenment, but leads at the same time a life of service with no ulterior motive. His is the life of a man who still marvels at the mystery of the human and of the universe. His deep knowledge of sociology, history, and politics makes him unique among the transdisciplinary French thinkers. “La Voie” is not only a synthesis of today's different crises but also a political act to make people understand how linked the crises are and that all the dimensions of the human crises should be addressed at the same time.

Aware of limitations of his book, he considers it more as an invitation to further his work. Many ideas that may seem unclear or limited can be better understood by reading his previous books. He has drawn boundaries around his work that are more or less representative of the so-called systemic and transdisciplinary communities in France, but there exist other integral and so-called disciplinary but nevertheless transdisciplinary working groups in France that are not covered by his work that international people should also take into account.

There are limitations that Edgar Morin seemingly was not or did not want to be aware of, but it is part of the game of going the way. Beyond these practical and necessary limitations, if one considers the book as a philosophical and political gesture, it is indeed showing us the way.

Transversity:
Transdisciplinary Approaches in Higher Education

(2011), by Sue L. T. McGregor and Russ Volckmann. Tuscon, AZ: Integral Publishers.

Reviewed by Nancy Glock-Grueneich

In their new book, *Transversity: Transdisciplinary Approaches in Higher Education*, Sue McGregor and Russ Volckmann lay out a vision for an institution of higher education whose design throughout supports such integration and/or interaction of disciplinary studies and inquiry as are necessary to address the most urgent of our human problems, most of them complex, "wicked," and necessarily "trans-disciplinary." They argue passionately for the need for such deep structural changes throughout higher education and contribute to the realization of that vision in this book in three ways.

First they attempt to tease apart the numerous terms for, and forms of, work that crosses disciplines, to clarify key differences and to suggest the elements critical to the most thoroughgoing of such integration, i.e., "transdisciplinarity." Secondly, they describe the commonalities and differences of educational initiatives they view as worthy of the term, in Arizona, Romania, Mexico, Brazil, and Australia, alluding as well to one in South Africa and one in India. In each case they describe the aspirations, guiding principles, current practices, and intended further developments that, taken together, qualify the programs in these institutions as something more than variation on inter-disciplinarities of various kinds, but as truly, or becoming truly, "transdisciplinary," i.e., as "transversities" in the making.

Though the book is more tendentious than collegial in tone, I found myself able to move past their sometimes overly polemical discourse to appreciate the useful distinctions and practical insights yielded by both their analysis of the literature and their range of case studies. Indeed, I was often excited by the potential evident in the cases they looked at, seeing not merely a series of well-conceived but inherently marginal pilots—with which higher education has always had more than its fair share—but perhaps the future of higher education itself glimmering on the horizon. Certainly that is what the authors intended for me to see—and I did.

For good reason they take the Arizona State University (ASU) as their most fully developed case in point. ASU has redesigned the way graduate programs are initiated and run, and faculty rewarded, to encourage work not only across disciplines of specific projects or research centers, but the on-going collaboration and gradual re-conception of how knowledge between disciplines, and inclusive of stakeholders, is to be developed, tested, used, refined, rewarded, and funded. Students are encouraged or required to work with classmates in other fields on shared projects, some student run and initiated. With extensive funding from both the private and government sectors, ASU has seen its enrollments increase, its funding expand, and the professional and

SOME RIGHTS RESERVED

academic recognition of its faculty—even within their own disciplines—increase rather than diminish! Thus, the authors quote the following article:

> Seven years ago, Arizona State University’s Department of Anthropology began its transformation into the ASU School of Human Evolution and Social Change. The move towards transdisciplinarity stirred up controversy and was deemed the deathblow of anthropology by some. Now, five years after the school’s official launch, an article in the May [2011] issue of Anthropology News reports on the reality—and success—of the paradigm shift. In the article, a team of school faculty and doctoral students details how the school, part of the College of Liberal Arts and Sciences, has prospered in many areas. Faculty size has nearly doubled, with 75 percent being anthropologists and others representing a diversity of fields, such as economics, science and technology studies and epidemiology. Overall enrollments have risen significantly, as have graduate student and external support. Diversity of faculty and students has increased. And while anthropology undergraduate and doctoral programs remain the largest degree programs, new transdisciplinary offerings in global health and environmental social science have been well received. (http://asunews.asu.edu/20110518_trans_anth). (p. 41)

The authors credit the President of the University, Michael Crow, with clear and visionary leadership and with the ability to surround himself with others as passionate and capable to carry out the vision. In particular, they mention David A. Young, Senior Vice President for Academic Affairs, a tenured professor of plant biology in ASU’s School of Life Sciences. Appointed in late 2006,

> He is credited with leading a redesign and transformation of the college resulting in the creation of eight new transdisciplinary schools, more than 20 new or refocused research centers, several major institutes to promote transdisciplinary research and an expansive Learning Communities Institute to provide enhanced learning experiences for undergraduate students. Under his leadership, the College of Liberal Arts and Sciences is now organized around five themes in addition to some traditional disciplines. These themes comprise: sustainability, complexity, origins, health and quality of life, and global engagement, see http://clas.asu.edu. Young’s role was to encourage, motivate and direct others in the University, particularly in the early efforts of the development of a School of Life Sciences (SOLS). (p. 33)

Each of the case studies offers new programs and new structures for supporting the gradual re-conception of knowledge in the institution to support true transdisciplinarity. Each stresses the need for a strong approach but one starting with the opportunity for all concerned to talk long enough to find common ground, mutual trust and inspiration, and a common language. And the need to continue to value and fund this process. Certainly a real strength of the book is its many telling if brief examples of how to work with the human processes to make it work.

I found the conceptual work not entirely satisfying but that is more the challenge of the topic than the failing of the authors. I appreciate that they allowed diverse if convergent viewpoints to be heard in their own voices and drew from them salient criteria without bogging down in excessive concern for terminology.

My most serious concern with the book is that it raised so many substantive, conceptual, and ethical questions, and then by-passed them, preferring instead to focus on the sociological and political concerns of, for example, how tenure is achieved by transdisciplinarians. I appreciate the importance of that question for achieving the goals put forth in the book.

But, more fundamental still, and still unaddressed in this book, are questions such as what of the traditional disciplines is critical to preserve, wherein the integrity, rigor, and power of their respective approaches is to be carried forward; and how full partnership with community and business, and funding by the latter, can protect inquiry from the self-serving biases or narrow vision that causes some of the problems in the "real world." Thus, for example, in this passage—still speaking about ASU:

> Again, we asked about the risks associated with such collaborations, for example, private industry rather than civil society setting the research agenda and supporting particular approaches or individuals in leading and managing these efforts, we were told that these have always been the risks in the marriage of higher education with other institutions that provide funding. Another risk is the ownership of the products of the research. Transdisciplinarity embraces the concept of copyleft instead of copyright, but this term was not mentioned in our interviews...The academic model at ASU supports making information widely available to foster scholarship and development; they consciously characterize their approach as translational research (2008-2009 Annual Report). The traditional industry model is to guard information closely (copyright, patents, intellectual property, trademarks). In a non-transdisciplinary mode, it is assumed that this information can make the difference in not only the profits of a company, but also its very future existence. ASU seems to have found a way to make these corporate partnerships work. (p. 38)

But what that "way" is, the authors don't tell us. Who sets the research agenda in a corporate/university partnership, who assures the integrity of the process and the assessment of the results, and who owns the results—such questions are not herein addressed in any systematic way.

These questions do have answers that can be found—and the risks they point to are still not reason to hold back from institutional transformations so necessary—but asked they must be, and well answered, if the result is to enrich and not impoverish our capacity to confront humanities urgent problems. They are reason to proceed with care.

This book helps raise some of the questions, and begin to find some of the answers, even if it does not take us far enough, it helps move us closer to what the future demands. And, above all, it brings home the point that this movement towards the integration of knowledge, and the closing gap between the world of inquiry, and the world of action, is not, as the authors emphasize just a "fad;" it is the wave of the future.

The goal to be sought, of course, is not to discard the disciplines, nor simply mush them together, but to hold fast to and even increase the rigor and power each discipline holds, while redesigning the enterprise to make more effective use of each, to build upon them, connect them, create conceptual frameworks that synthesize them, and where appropriate—but only where appropriate—to integrate them. In short, the goal is to assure that in times now coming, those schooled most highly are not thereby precluded by overspecialization from making connections, and solving our most difficult problems, but are all the better prepared to do so having gained their knowledge within institutions committed to connectedness and relevance.

Spirituality, Religion, Contemplative Practices, and Socially Transformative Service in the 21st Century

Special Issue Introduction

Issue Editor: Bahman A. K. Shirazi[1]

I welcome you to this issue of *Integral Review*. This is our second special issue from the California Institute of Integral Studies and the Symposium on Integral Consciousness. Integral Review is glad to deepen our association with CIIS with the continuation of these special issues. We believe they enrich the range of perspectives and thought available to the growing scholarly community making use of IR. As the value and contribution of integral thought continues to expand into the academic world, we are grateful to be able to continue publishing works like those found in this issue. We are also grateful for and wish to acknowledge the work of Bahman Shirazi in continuing to take on the responsibility for guiding the articles presented here through the editorial process. I will leave you now to take in his introductory remarks, and hope you enjoy reading through this issue.

JReams

Jonathan Reams,
Editor-in-Chief
Integral Review

The articles in this special issue of *Integral Rev*iew highlight selected contributions to the 2011 Symposium on Integral Consciousness at the California Institute of Integral Studies (CIIS) (www.ciis.edu). This annual symposium provides a forum for CIIS community members and friends to exchange and deepen their understanding of integral consciousness, its evolution, and its relationship to the current planetary challenges and transformational processes.

Each year there are several themes covered in a variety of presentation formats: keynote and standard presentations, as well as a number of interactive sessions and workshops. You can find more information on these activities at the Symposium site:
http://ciislibrary.wordpress.com/2010-symposium/.

The overarching theme in 2011 was: Spirituality, Religion, Contemplative Practices, and Socially Transformative Service in the 21st Century. The contributions highlighted in this issue

are connected in multiple ways. If interested, one could simply start at the top of the list, and hopefully find an underlying connection between all of them in the order presented. It is also possible to start with a topic of choice and navigate through the whole collection over time; or simply choose topics of interest. You might find that some key topics briefly covered in one article, are more fully discussed in one or more others. Or perhaps, one might begin to see how these pieces, despite the variations in theme, length or detail, comprise a window to the limitless world of integrality and find resonance with respect to one's unique perspectives and experiential context.

We begin with Higher Education and Interreligious Dialogue by Joseph L. Subbiondo who stresses the need for inclusion of courses on religion and spirituality, as well as interreligious dialogue in higher education, through an examination of three interrelated dimensions: Interreligious dialogue, religious pluralism and religious literacy. Drawing on some recent research such as that of University of California, Los Angeles' Higher Education Research Institute, as well as other recent publications on religion and spirituality in the United States, he highlights the importance of the place of higher education in overcoming religious illiteracy in a world in which religious tensions have been on the rise, and colleges and universities are predominantly secular in their curricular outlook. The article also mentions some initiatives in this direction at the California Institute of Integral Studies.

In New Religious Movements, Modern Esoteric Movements, and Integral Consciousness, Constance A. Jones who is an expert in this field, provides a brief overview of the new religions and spiritual communities which have emerged in recent decades. These new religious movements are among the many trends that shape today's religious consciousness. This essay argues that eastern thought in the west, fostered in large part through the growth of new religious movements, and western esoteric teachings which have appeared in many guises throughout the history of the West, are reemerging in our time and that understanding these movements and their alignment can deepen our appreciation of the foundations of integral consciousness.

Rethinking the Future of World Religion: Four Scenarios is the summary of a conversation I had with Jorge Ferrer who has been reflecting on the aforementioned religious movements and has presented four scenarios about the future of religion: global religion; mutual transformation of religions; interspiritual wisdom; and spirituality without religion. We also discussed his own participatory vision based on his various publications. He reflects on whether humanity will ultimately converge into one single religion, or continue to diversify into numerous forms of spiritual expression; or perhaps, a middle path reconciling the human longing for spiritual unity, and the developmental and evolutionary gravitation toward spiritual individuation and differentiation will emerge. We explored implications of these scenarios and other related topics such as the importance of embodied and whole person approaches to personal and collective integration.

Next, in Transformative Body Practices and Social Change: The Intersection Between Spirituality and Activism, Don H. Johnson highlights the intersections of embodied spiritual practices and organizing for social change through the seemingly different, but potentially complementary perspectives of two leading revolutionaries, Mahatma Gandhi and Wilhelm

Reich. He focuses on the importance of body cultivation in addressing social issues and how traditional practices might be taught to prepare the practitioner for dealing with grief.

In the next essay, The New Myth: Frederic Spiegelberg and the Rise of a Whole Earth, Ahmed M. Kabil provides, through the life and teachings of Frederic Spiegelberg, a novel account of some of the unique historical and intellectual developments that converged in the San Francisco Bay Area in the mid twentieth century and subsequently informed and enabled many of the defining chapters of recent global history. Spiegelberg was instrumental in creating the American Academy of Asian Studies (a predecessor to CIIS) in San Francisco by inviting pioneering east-west scholars such as Haridas Chaudhuri (founder of CIIS) and Allan Watts who are responsible for the early dissemination of Asian spiritual traditions in the west. The conversations and writings by Spiegelberg, Watts, and Chaudhuri lead the way toward cultural movements such as the San Francisco Renaissance, the rise of the counterculture, the environmental awareness, and the information age revolution. This well-researched essay connects some key developments in world consciousness in the last 60 years. Of special importance is the connection between science (and recent technological developments) and spiritual consciousness which may be apparently diametrical, but are actually complementary in an all-embracing integral consciousness.

In The Future History of Consciousness, David Hutchinson picks up on the theme of science, spirituality and integral consciousness in an intriguing reflection on the future of integral consciousness. He asserts that ‘consciousness’ is the key fact of life and that the study of it is in its infancy. He maintains that spirituality and science are bound to meet and argues that science is moving rapidly into the hitherto unexplored subjective areas such as dreams, thought processes, and awareness and asserts that we are on the verge of a momentous shift in knowledge and ability with consciousness driven by exponential change in theory and technology.

In the article titled Sri Aurobindo’s Lila: The Nature of Divine Play According to Integral Advaita, Matthew W. Morey highlights a key aspect of integral consciousness focusing on the concept of Lila, or Divine Play, in the context of Integral non-dualism as described by Sri Aurobindo and Haridas Chaudhuri. To provide a context for this topic, he first recounts Haridas Chaudhuri’s brilliant exposition of the various schools of Advaita (non-dual) Vedanta and how Integral consciousness is a culmination of several key spiritual philosophical schools of Indian thought known as Advaita Vedanta. The second part of the essay directly addresses Sri Aurobindo’s description of Lila, a play that is at once a dalliance of the Divine and a teleological drama. In the context of Lila, the essay examines evolution, the individual poise of Brahman and the participatory nature of Integral Yoga.

Debashish Banerji’s Structure and Process: Integral Philosophy and Triple Transformation takes the reader deeper into the core of integral consciousness, philosophy and yoga. He starts by examining the debate concerning perennialism and pluralism in religious studies and considers the category of the ‘integral’, as described by Sri Aurobindo in the context of this debate. After exploring the case for perennialism vis-à-vis pluralism, he compares the contemporary taxonomy of a perennial core to mystical experience developed by Robert K. C. Forman with the idea of the “triple transformation” developed by Sri Aurobindo.

Finally, in United Religions Initiative: Global Community Emerging, Sally Mahé provides an introduction to United Religions Initiative (URI), a global grassroots interfaith network that promotes peace and justice through intercultural and interreligious dialogue using a process known as ‘appreciative inquiry’. URI is a leading example of a global organization which has successfully implemented the participatory and pluralistic vision at the core of a holistic and global approach to interreligious dialogue and interfaith cooperation. While she highlights some of the accomplishments of URI, she stresses that more cooperation, more compassion, and more commitment to good relationships is needed across the world for global unity, justice and peace.

Gratitude is due to editors of *Integral Review* for providing support for this publication.

Higher Education and Interreligious Dialogue

Joseph L. Subbiondo[1]

Abstract: This article highlights the current need for inclusion of courses on religion and spirituality, as well as interreligious dialogue in higher education through an examination of three interrelated dimensions: Interreligious dialogue, religious pluralism and religious literacy. Some initiatives in this direction at the California Institute of Integral Studies are discussed.

Key Words: Higher Education; interreligious dialogue; Religious Pluralism; Religious literacy; California Institute of Integral Studies.

In 1973, the California Institute of Asian Studies, as the California Institute of Integral Studies (CIIS) was known then, applied for accreditation by the Western Association of Schools and Colleges (WASC). Led by the primary founders of CIIS, Haridas and Bina Chaudhuri, the Institute prepared a compelling institutional report in which they affirmed the quality of the academic programs as well as the operations of the Institute. In the report, the following courses were listed among the requirements of MA degree programs*:* ‘Comparative Religion: East and West’, ‘Comparative Mysticism’, ‘Comparative Theology’, ‘Religion and Comparative Politics’, and ‘Varieties of Mystical and Psychedelic Experiences’. The following courses were listed among the electives: ‘Meditation and Other Spiritual Disciplines’, ‘Religious Symbols’, and ‘Psychophysiology of Religious Experiences’. Certainly, a forward thinking curriculum for today, and a remarkably progressive one in 1973!

As you can see, interreligious study and dialogue has been a significant constituent of the CIIS educational experience since its founding. In keeping with this founding vision, which was and continues to be well ahead of its time, I will focus here on the now more-than-ever need for higher education in general, and CIIS in particular, to advance interreligious dialogue. To show the inextricable link between higher education and interreligious dialogue, I propose the following assertions:

a) Interreligious dialogue requires religious pluralism;
b) Religious pluralism requires religious literacy; and
c) Religious literacy requires higher education**.**

---

[1] **Joseph L. Subbiondo,** president of CIIS since June 1999, has an accomplished background in both administration and academics. He brings a 30-year history of achievement in higher education, including appointments on several international academic committees; and he has been active on many accreditation teams for the Western Association of Schools and Colleges. Prior to coming to CIIS, he served as Dean of the School of Liberal Arts at St. Mary's College of California; Vice President for Academic Affairs at the University of the Pacific; Dean of the College of Arts and Sciences at Santa Clara University; and as a professor of English and linguistics at four universities.

We know too well the consequences of living in a world that is in need of interreligious dialogue. Most, if not all, of the wars in our lifetimes have been or are being fought largely because of religious difference. For example, Catholics and Protestants in Northern Ireland, Hindus and Muslims in India, Muslims and Jews in Israel and Palestine, and Sunnis and Shiites in Iraq …. and the list goes on. The United States is not immune to violence in the name of religion as the post 9/11 assaults, such as the murder of a Sikh in Mesa, Arizona will attest.

Religion as a justification for war is as old as religion itself. For as long as we have recorded history, people have interpreted their religious beliefs as mandates to plunge themselves and their societies into deadly conflicts. It is easy to understand why many people identify war with religion. As Rabbi Jonathan Sacks (2005) points out in his book, *To Heal a Fractured World,* "Too often [religion] appears on the news, and lodges in the mind, as extremism, violence, and aggression" (p. 9).

Because religion has served as a battle cry, many reasonable people have argued that we should do away with it because it prevents peace and perpetuates oppression. For example, Richard Dawkins (2006) asserts this position in *The God Delusion*, as does Christopher Hitchens (2009) in his book, *God Is Not Great: How Religion Poisons Everything.* While Dawkins and Hitchens are correct in maintaining that religion has too often been associated with evil throughout history, I support Karen Armstrong's response to Dawkins and Hitchens in *The Case for God* (Armstrong, 2009). She writes: "It is … misleading to insist that all the problems of the modern world are entirely due to religion, if only because at this perilous moment in human history we need clear heads and accurate intelligence" (p.306). Haridas Chaudhuri (1984) was certainly clear headed and accurately intelligent regarding religion. He wrote in *Modern Man's Religion*:

> …religion is an autonomous function of the spirit. It can hardly be replaced by any non religious discipline. That which seeks to replace religion in a radically atheistic and anti-religious mood begins soon to function as a special kind of religion. So the great need of our present day is not to reject religion but to reconstruct it in accordance with the intellectual climate and the specific requirements of the present age. (p. ix)

Drawing on Chaudhuri's notion of reconstruction, religion has been and can be (reconstructed if necessary as) a primary inspiration for global peace and social justice. Supporting this possibility is the claim that all the major world religions incorporate some version of the golden rule: "do unto others as you would have them do to you." As noted by Rabbi Sydney Schwarz (2008) in *Judaism and Justice,* "According to God's covenant with Abraham, every Jew [and I could add members of nearly every religion] is called upon not simply to *believe* in the values of righteousness and justice, but to *act* on them" (p.34). In their comprehensive histories of world religions, Karen Armstrong and Huston Smith document in extensive detail that the world's religions attracted vast numbers of followers because they responded to a universal human longing for global peace and social justice.

If the teachings of the major world religions promote peace and social justice, then why are we living in an age tormented by religious wars? Charles Kimball (2008), professor of comparative religion at Wake Forest University, offers an answer in his book, *When Religion Becomes Evil*.

Kimball asserts that throughout history people have often “corrupted” traditional religion by aligning it with their violent intentions. Examining the history of world religions, Kimball identifies “five warning signs” that indicate that a religion is being “corrupted”: (1) absolute truth claims, (2) blind obedience, (3) ordained historical time, (4) ends justifying means, and (5) declaration of a holy war. Kimball’s five warning signs have one highly destructive element in common: exclusion.

The most potent antidote to exclusion is a progressive stage of inclusion—what we consider *pluralism*. With pluralism in mind, I turn to the first part of my assertion.

Interreligious Dialogue Requires Religious Pluralism.

Religious pluralism only exists in an environment where there is religious diversity, but religious diversity alone cannot guarantee religious pluralism. Religious pluralism requires consistent study, reflection, respect, and difficult conversation. Religious pluralism enables us to stand together despite profoundly held differences. While there are many similarities among the core beliefs of the world’s religions, religious pluralism is not a “melting pot” in which all religions become the same. The religious pluralism that can be a path to interreligious dialogue demands that we honor the integrity of each faith tradition as a distinctive and legitimate lens for viewing the sacred.

In his book, *How to Win a Cosmic War: God, Globalization, and the End of the War on Terror,* Reza Aslan (2009) argues that the way to end a “cosmic war” is to avoid representing religious conflict as a cosmic battle between “good” and “evil.” Aslan insists that by moving war to the cosmic playing field, we elevate war. Rather, he contends that we need to see religious war for what it is; namely, people using religion to justify their worst intentions and deplorable actions. Aslan goes so far as to claim that religious pluralism, especially in local settings, could eliminate religious war. Through a series of compelling examples, Aslan makes a case to support his claim that Muslims become suicide bombers when they are marginalized, alienated, and disaffected because of their religion. If we can reverse this trend, we can move ourselves closer to world peace.

Eboo Patel, founder of the Interfaith Youth Core in Chicago, and author of the autobiographical *Acts of Faith: The Story of an American Muslim, the Struggle for the Soul of a Generation* (Patel, 2007), holds a view similar to that of Aslan. Patel noted that the 9/11 hijackers were examples of what happens when young men are recruited into exclusive and extreme religious fundamentalism[2]. Patel (2007) calls us to embrace religious pluralism. He writes:

> One Hundred years ago, the great African American scholar W. E. B. Du Bois famously said, “The problem of the twentieth century is the problem of the color line.” I believe that the twenty-first century will be shaped by the question of the faith line. On one side of the faith line are the religious totalitarians. Their conviction is that only one interpretation of

---

[2] For a detailed account that provides support for Aslan’s and Patel’s arguments, please read Lawrence Wright’s (2006) Pulitzer Prize winning *The Looming Tower: Al-Qaeda and the Road to 9/11*, in which Wright tracked the life journeys of each of the 9/11 hijackers.

> one religion is a legitimate way of being, believing, and belonging on earth. Everyone else needs to be cowed, or converted, or condemned, or killed. On the other side of the faith line are the religious pluralists, who hold that people believing in different creeds and belonging to different communities need to learn to live together. (p. xv)

Patel's book chronicles his engaging story of being raised a Muslim, learning about Mormonism in high school, Roman Catholicism in college, and Islam in graduate school. Each of his intensive contacts with various religions eventually brought him to reclaim his religious identity as a Muslim. He drew important lessons from each of the religions that he experienced; for example, from Roman Catholicism, he learned how to bridge religion and social responsibility when, as a student at the University of Illinois, he was a community member of the Dorothy Day Catholic Worker house in Champaign. He writes: "The most radical part about Dorothy Day and the Catholic Worker movement was the insistence that everything the movement did was guided by a single force: *love*" (Patel, 2007, p. 50).

For a thorough study of the increasing religious diversity in the United States, I strongly recommend Diana Eck's excellent book, *A New Religious America: How a "Christian Country" Has Become the World's Most Religiously Diverse Nation* (Eck, 2001). Eck drew on the research of her "Pluralism Project at Harvard," a project built on extensive interviews conducted by her students and herself of religious leaders and groups. Eck points out that religious…

> Pluralism is not an ideology, not a leftist scheme, and not free-form relativism. Rather, pluralism is the dynamic process through which we engage with one another in and through our very deepest differences … Pluralism is not a *given*—it must be *created.* (p. 70)

One of the most effective organizations engaged in promoting religious pluralism worldwide is the United Religions Initiative (URI) which provides models and training in creating circles of religious dialogue. Located in San Francisco and founded by William Swing, the former Episcopal Bishop of California and international peace activist, the URI is a …

> … global network of locally organized 'Cooperation Circles' acting to promote enduring daily interfaith cooperation, to end religiously motivated violence and to create cultures of peace, justice and healing. Groups are called Cooperation Circles because they are formed by people of different [religious] traditions who come together to initiate acts of interfaith cooperation. (http://www.uri.org/)

The URI defines a Cooperation Circle as the basic unit of URI membership and consists of local or virtual groups that include at least seven members and at least three different religions, spiritual expressions, and indigenous traditions. (for more information see: http://www.uri.org/cooperation_circles)

Religious Pluralism Requires Religious Literacy

Stephen Prothero, professor of religious studies at Boston University, writes about the widespread religious illiteracy in the United States in his book *Religious Literacy: What*

Americans Need to Know (Prothero, 2007a). In his essay “Worshiping in Ignorance” published in *Chronicle of Higher Education,* Prothero warns:

> Religious illiteracy is more dangerous [than cultural illiteracy] because religion is the most volatile constituent of culture. Religion has been, in addition to one of the greatest forces for good in world history, one of the greatest forces of evil. (Prothero, 2007b, p. B6)

Later in the same essay, he points out:

> Americans remain profoundly ignorant about their own religions and those of others. According to recent polls, most American adults cannot name even one of the four Gospels, and many high-school seniors think that Sodom and Gomorrah were husband and wife. (p. B6)

Prothero affirms that there are integrative connections among interreligious dialogue, religious pluralism, and religious literacy: he writes…

> Each of the world’s great religions has wrestled for centuries with the foundational questions of life and death and whatever (if anything) lies beyond. Each has developed sophisticated theologies for making sense of other religions, for regulating war, [and] for fighting injustice. (p. B7)

Prothero points out that as a nation, the US is religiously illiterate; yet eighty percent of its citizens claim to be religious and/or spiritual.

This high percentage of national identification with religion and/or spirituality is reflected at colleges and universities among students who are very comfortable with religion and among faculty members who have an emerging interest in religion. Alexander and Helen Astin and the research team at the Higher Education Research Institute (HERI) at UCLA are engaged in the longitudinal project, *Spirituality in Higher Education.* Periodically, they have been publishing reports based on the research from their extensive surveys, and they have published their findings in their book, *Cultivating Spirit: How Colleges Can Enhance Students’ Inner Lives.* (Astin, A., Astin, H. & Lindholm, J., 2011). It has been my good fortune to have been a consultant on a mid-point developmental phase of this project. In the phase, teams from ten colleges and universities explored specific ways that they could encourage the spiritual growth of students because these institutions discovered that spiritual growth typically improved students’ academic performance and well being.

The UCLA 2003 survey of 112,232 students entering their first year at 236 colleges and universities and 3,680 third year students attending 46 institutions indicated that 80% of the students were interested in religion and/or spirituality and that they believed in the sacredness of life. In addition, 50% were on spiritual quests, 75% were searching for the meaning and purpose of life, 80% regularly attended services and discussed religion with friends, 75% believed in God, 71% were sustained by their religious and spiritual values and beliefs, and 66% prayed regularly.

In 2004-05, the UCLA research team surveyed 65,124 professors at 511 colleges and universities and reported the following results: 81% of the faculty members considered themselves spiritual persons, 70% stated that they were developing a meaningful philosophy of life; 69% sought opportunities to grow spiritually, 68% engaged in self-reflection, and 47% integrated spirituality into their lives. The 2004-05 faculty surveys revealed that faculty members who identified themselves as spiritual and/or religious scored significantly higher (better than 8 to 1) than their non-spiritual and/or religious counterparts in supporting students' personal development; and by a margin of 2 to 1 in favoring student-centered pedagogy and in advocating civic-minded practice and values.

While a majority of faculty members (57%) disagreed with the statement that "The spiritual dimension of faculty members' lives has no place in the academy," a minority (30%) agreed that colleges should be concerned with facilitating students' spiritual development. This determination was consistent with responses from third year students who noted "that their professors have never encouraged discussion of spiritual or religious matters, and never provide opportunities for discussing the meaning or purposes of life." However, many faculty members believed that the following educational goals were 'essential' or 'very important': enhancing self-understanding (60%), developing moral character (59%), and helping students develop personal values (53%). Lastly, the UCLA researchers examined faculty responses by discipline; and they found that the health sciences, humanities, and education were among the highest in believing that higher education should facilitate spiritual development and the social, physical, and biological sciences were among the lowest.

In studying both surveys, the UCLA team concluded that "it appears that colleges and universities are doing little to help students explore these issues and support their search in the sphere of values and beliefs." The team noted that "there is a sharp divide between students' interests and what happens in the classroom" This "sharp divide" raises a critical question for colleges and universities: should they reduce this divide" (for more information see Spirituality in Higher Education website: www.spirituality.ucla.edu).

As I stated at the beginning of this essay, colleges and universities are major keys to developing interreligious dialogue because they can educate their students in religious literacy, a prerequisite for religious pluralism which, in turn, is a perquisite for interreligious dialogue. In short, we cannot understand, appreciate, or respect what we do not know.

Religious Literacy Requires Higher Education

I will suggest three steps that higher education should consider, and I will comment on plans that we are discussing at CIIS to advance religious literacy: 1) offer courses on the diversity of religious and spiritual practices; 2) integrate religion and spirituality throughout the curriculum; 3) increase awareness of and practice in social justice.

The first step that colleges and universities could take to cultivate religious literacy would be to provide students with opportunities to study a variety of religions. I agree with Professor Prothero that colleges and universities should require courses in religion for all academic major programs; and at the very least, they should require a course in comparative world religions.

Many higher education institutions are increasing their elective courses in religious studies, and enrollments have been exceeding expectations. At faith based colleges and universities where students can easily study and practice a religion, students should be encouraged to study religions other than their own.

Thomas Merton (1915-1968), the celebrated Trappist monk, wrote passionately about the dangers of knowing only one's own religion. He wrote:

> We must … admit with regret that, in the past, the tendency of Christians has been to regard all non-Christian religious experience as so obviously suspect as to be either too dangerous to study or else not worth the trouble of being studied. (Merton, 1967, p. 204)

Drawing on the traditions of contemplative practice in the East and the West, Merton pointed out that contemplative practice provides a fresh lens for interreligious study:

> One of the most important aspects of interfaith dialogue has …been one of the least discussed; it is the special contribution that the contemplative life can bring to the dialogue, not only among Christians, but also between Christians and the ancient religions of the East…. (p. 203)

Bede Griffiths (1906-1993), a Benedictine monk, established a religious and spiritual center in India near Bangalore. Griffiths enjoyed the respect of the local Hindus as they referred to him as *Sadhu*— a holy man. In his illuminating book, *The Marriage of East and West,* Griffiths (1982), like Merton, made a compelling case for knowing a faith other than one's own. He wrote:

> It was not merely the desire for new ideas which drew me to India, but the desire for a new way of life. I remember writing to a friend at the time: 'I want to discover the other half of my soul.' I had begun to discover that there was something lacking not only in the Western world but in the Western Church. We were living from one half of our soul, from the conscious, rational level and we needed to discover the other half, the unconscious, intuitive dimension. (pp. 7-8)

At CIIS, in response to increasing requests that we offer more courses and public programs reflecting the broad diversity of religions and spiritual traditions, we are increasing our offerings in comparative world religions in our Philosophy and Religion Program as well as in our Public Programs. In fact, we are working with several faculty members in considering ways to expand the presence of interreligious dialogue at CIIS. Also, our Public Programs has been organizing events for the general public that are grounded in interreligious dialogue featuring leading figures such as Karen Armstrong, Coleman Barks, Daisy Kahn, Joan Halifax, and Cornel West among many others.

A second step that colleges and universities can take to advance religious literacy is integrating religion and spirituality throughout the curriculum. In her book *Speaking of Faith: Why Religion Matters and How to Talk about it,* Krista Tippett (2007) rightly notes: "Religion has moved from the side lines to the center of world affairs and American life" (p. 9). It is not in my opinion a stretch to argue that whether or not people believe in any particular religion, they need to study religion.

An excellent resource for integrating religions into the curriculum is *The Forum on Religion and Ecology*. Mary Evelyn Tucker and John Grim, Professors of Religion at Yale and co-directors of the *Forum*, believe that religions need to be in interactive dialogue with academic disciplines (including the natural sciences, ethics, economics, education, public policy, and gender studies) in order to develop comprehensive solutions to global, as well as local, environmental problems. The Philosophy, Cosmology, and Consciousness program faculty work closely with Mary Evelyn and John.

Because much of higher education takes place outside the classroom, let us consider a third step that colleges and universities could take: increase awareness of and practice in social justice**.** Through activities such as service learning projects and student internships, we can help students engage in promoting social responsibility. As Rabbi Jonathan Sacks (2005) has insisted, “The God who gave us the gift of freedom asks us to use it to honor and enhance the freedom of others. God, the ultimate Other, asks us to reach out to the human other” (p.3). Sacks emphasizes his point: “Jewish ethics is refreshingly down-to-earth. If someone is in need, give” (p.5). Sacks recognized the current urgency of charity and social justice: “Now, of all times, we should be holding out the hand of friendship to strangers, help to those in need” (p. 265).

To support students in this endeavor, colleges and universities can encourage campus interreligious and religious groups to live the social responsibility commitments of their spiritual and faith traditions. For example, students can help the homeless, tutor children of underserved populations, visit the abandoned elderly, serve non-profit organizations, and volunteer in community service programs.

Focus on community service at CIIS has been eloquently articulated in the *Beloved Community* initiatives at CIIS. In recognition of our many community service programs especially our six counseling centers, CIIS was invited and has become a member of Campus Compact, an organization that has both a state and a national network of colleges and universities engaged in community service. In spring of 2011, I forwarded the CIIS faculty and staff a preview of President Obama’s forthcoming Interfaith and Community Service Campus Challenge. Certainly CIIS is meeting this challenge and we certainly will let President Obama know that we are.

Furthermore, we are currently in the process of developing the Chaudhuri Center with the mission to integrate contemplative practice, interreligious dialogue, and social justice. The Center, in effect, would incorporate all three steps that I have been recommending. The Center recently co-sponsored a lecture series on Interreligious Dialogue and Social Justice at the Interfaith Center at the Presidio. (for more information visit: http://www.ciis.edu/about_ciis/chaudhuri_center.html).

I will conclude my remarks by citing the last sentence of Karen Armstrong’s book, *The Great Transformations: The Beginnings of our Religious Traditions*:

> Auschwitz, Bosnia, and the destruction of the World Trade Center revealed the darkness of the human heart. Today, we are living in a tragic world where, as the Greeks knew, there can be no simple answers; the genre of tragedy demands that we learn to see things from other people's points of view. If religion is to bring light to our broken world we need […] to go in search of the lost heart, the spirit of compassion that lies at the core of all our [religious and spiritual] traditions. (Armstrong, 2006, p. 476)

We have a long and complex journey ahead of us if we wish to arrive at pluralistic interreligious dialogue, and higher education can significantly help us negotiate the many and seemingly insurmountable obstacles that stand in our way.

New Religious Movements, Modern Esoteric Movements, and Integral Consciousness

Constance A. Jones, Ph.D.[1]

Abstract: Sensibilities toward Eastern thought in the West, fostered in large part through the growth of new religious movements, align with the elements of Western esoteric teachings which have appeared in many guises throughout the history of the West and are reemerging in our time. Understanding these sensibilities and their alignment can deepen our appreciation of the foundations of integral consciousness.

Key Words: Esotericism, Integral Consciousness, New Religious Movements.

Introduction

The religious landscape is changing and we are in a particularly advantageous place from which to view these alterations. Not only is California the site of more new religious movements than elsewhere in this country (and perhaps the world), but the California Institute of Integral Studies (CIIS) offers fertile soil and is a veritable greenhouse for change in consciousness. I have studied new religions in America since 1970 and have recently begun to examine esotericism throughout history in the West. I suggest that these two impulses, new religious movements and esoteric movements, may offer insights into our understanding of integral consciousness.

Personal Standpoint

In the early 1970s, when I began to study the sociology of new religions, the larger field of sociology of religion was declining. Many sociologists were predicting that the field of sociology of religion would cease to exist, since the dominant theory of the day was the secularization hypothesis that modern societies would find religion less and less important over time as rational thought and scientific progress would move us away from belief and superstition. The last forty years demonstrate that these predictions were erroneous. We have a burgeoning of religion and

huge shifts in religious affiliations. Reports of the demise of the sociology of religion were premature and overstated. The sociology of religion is needed more than ever to understand why these changes in religious phenomena are occurring.

The Religious Landscape in the United States

A quick overview of religious affiliations in the U.S. demonstrates what Americans have always known that religion matters. In the traditional religions of this country (Judaism, Roman Catholicism, and Protestantism) conservative groups are growing and liberal groups are declining in membership. In the world of Protestantism, liberal denominations (such as Episcopal and Methodist) are declining, while conservative denominations (such as Jehovah's Witnesses, Mormons, and other evangelical churches) are growing. Eastern religious beliefs and practices, particularly those of Hinduism, Buddhism, Taoism, Sikhism, and Jainism, are proliferating in the larger culture, even if formal membership grows only slightly or not at all. Today, almost everyone in this society knows the meanings of religious concepts from the East, such as karma and reincarnation. But only two generations ago, few Americans knew these concepts, or the basics of astrology, Tarot, or the I-Ching.

New Religious Movements

The breadth of belief and practice demonstrated in new religious movements in this country is immense. Of particular interest to us are the ancient traditions from the East that appeared in abundance after the Asian Exclusion Act was repealed in 1965. The U.S. saw many teachers from Hinduism, Buddhism, Sikhism, Jainism, Taoism, and Sufism appear and attract devotees to Eastern beliefs and practices. Interestingly, some of the oldest religious traditions on earth are classified sociologically as "new religions" in the U.S. because they entered the mainstream culture in the last 100 or so years. There has also been a reclaiming (some would say a revitalization) of indigenous spirituality centered around pagan thought and practice, goddess spirituality, and renewed connection to nature through shamanism and entheogens.

Other movements, such as Scientology, Christian Science, UFO groups, and channelers claim to unite religion and science and to use empirical methods to bolster faith and a spiritual cosmology. New Age groups combine these distinctive threads into innovative forms that seem to demonstrate endless permutations. Even newer are the growing fundamentalist movements in the major world religions, including Christianity, Judaism, Islam, and even Hinduism.

This brief sketch of the panoply of new religious impulses is cursory, but telling. What we see is a growing eclecticism among those who accept liberal versions of traditional religions. It is not uncommon to find individuals who simultaneously study Kaballah, attend an Episcopal church, go to Buddhist retreats, visit shamans in Peru, have Tarot readings, practice yoga, and meditate. This movement toward eclecticism and the privatizing of religion has long been noted by scholars of religion. In the 60's, Thomas Luckmann (1967) called this form of spirituality "the invisible religion"; in the 70's Agehananda Bharati (1976, p. 11) referred to the "aloha-amigo" syndrome, which he described as "pathological eclecticism"; and in the 80's, Robert Bellah (1985) coined the term "Sheilaism". Each term refers to the assertion that religion is essentially a private matter to be constructed idiosyncratically and that no particular constraint is placed on individuals by a historic church or religious community.

Bellah (1986) found in the 1980s that 80% of Americans agreed with the statement: “an individual should arrive at his or her own religious beliefs independent of any churches of synagogues”(p. 2). When such privatism combines with eclecticism, we see a ‘make your own’ religion, as each person can pick and choose what he or she prefers from the smorgasbord of beliefs and practices that is openly available. Among some, the ability ‘to make your own’ religion has also become valorized under the term “spirituality”, as distinct from religion. Others define the eclecticism of the smorgasbord as pathological; especially if, as most traditions assert, one must go deeply into one tradition to benefit from its wisdom and transformative promise.

Also new, but in opposition to this sampling at the smorgasbord of belief and practice, is an entrenchment in various traditions in order to preserve what is considered a “pure” but threatened religious tradition, usually to a depth of conservatism and rejection of interfaith dialogue that supersedes any previous stage in the tradition. This phenomenon includes the growing fundamentalisms in several world religions, a decidedly important trend—but not part of our consideration here—because the fundamentalist impulse of exclusivism runs counter to the impulse toward integral consciousness.

Esotericism

Esotericism, broadly understood as the hidden side of any institutionalized religious tradition, has many definitions. For our purposes, we emphasize the personal struggle for progressive elucidation at multiple levels of reality. Esotericism involves submitting oneself to a conscious and transcendent reality that is contacted within the self. It is a psychological enterprise that includes both the sacred and the profane in a quest for self-knowledge, which does not depend upon acceptance of any system of belief or morality. Although the site of transformation is the psyche, esotericism relies on communities of practice and teachers to provide conditions for transformation. Thus, the esoteric enterprise cannot be completely privatized. Esotericism involves a way of engagement quite distinct from institutionalized or exoteric religion.

Exoteric religion contrasts with esotericism in that traditional exoteric religion in the West defines the human condition as one of sin and the goal of life as salvation—this is particularly true of Christianity. The means to salvation include belief, faith, and doctrinal orthodoxy. We even refer to individuals who practice a religion as ‘believers’. Western exoteric religion is dualistic, dividing morality into good and bad elements and cosmology into the creator and the created. Exoteric religion involves membership in an institution (e.g. church, synagogue, or mosque) that promotes practices and rituals derived from faith and belief.

Esotericism, on the other hand, defines the human condition as one of ignorance and fragmentation and the goal of life as gnosis, evolution, and transformation, with different degrees of emphasis on these goals in various traditions. The means to transformation include inquiry, self-observation, knowledge, and integration of the parts of the self into a whole. Esoteric religion is non-dual, emphasizing universalistic themes; members can be in all faiths. Instead of membership in a religious institution, esotericists belong to schools and follow a teaching rather than a belief system. Their practice is more akin to an exploratory inquiry than a faith-based orthodoxy. Instead of being a “believer,” an esotericist is more properly termed a ‘student.’[2]

What does the shift from exoteric religious belief to new religions and esotericism signal? The answer is multi-faceted and requires considerable explanation. I point here to only a few themes that are salient for our consideration because these themes also participate in what we identify as integral consciousness.

How New Religions and Esotericism Contribute to Integral Consciousness

The search begins as a yearning for authenticity. We are not as we can be and in our fragmented and conflicted state, we are not whole. We are able to be greater and are called to be greater than we are. We sense a personal obligation to search for a change in our state of being. Some impulse calls for a rebellion against the unresolved compartmentalization and contradictions in modern society, in all of its manifestations—religion, family, education, science, ethics, art, etc. In a quest for wholeness, many attempts are made, sometimes misguided, to grapple with the ethical and metaphysical relativism that defines our age.

A mechanistic model of the universe no longer suffices. We learn from indigenous, pagan, and Eastern traditions that the universe is not inanimate, but rather conscious and that the universe constitutes a teaching in itself. Nature is thus living and conscious and we participate in its unity, not as separate entities, but as fractals of a whole. We learn that study of our psychology and study of the cosmos are mutually reinforcing. In fact, one learns about oneself through knowledge of the workings of the larger cosmos. We begin to see relationships and identity between the microcosm and the macrocosm. Individual healing reflects cosmic principles, as in the alchemical axiom ‘as above, so below’.

Although acutely aware of the many differences among us, we recognize a universalizing principle that rises above sectarianism to affirm that all humans are in a common struggle for liberation from the bondage of conditioning. In recognition that we can be liberated only after intense study of ourselves, we have an impulse to unite with others in an effort, a work, to make more of ourselves and our communities than we can even comprehend at this point. A local exemplar of this impulse is the Cultural Integration Fellowship[3] in San Francisco founded by Haridas Chaudhuri. In our intent to transform self and society, we find that our efforts need to be trans-religious, trans-cultural, and trans-gender. Frithjof Schuon (1984) refers to the transcendent unity of religions; Robert Bellah (1986) asserts that “the religious heritage of the human species is one”(p.3). Somehow we reckon that we are deeply interdependent.

---

[2] Western esoteric movements have existed much like an underground stream throughout Western history, surfacing in distinct places and times, but with similar principles and practices. A few examples to illustrate the breadth of esotericism include: Essenes, Greek Mystery Cults, Pythagoreanism, Kaballah, Sufism, Theosophy, Freemasonry, Anthroposophy, Rosicrucianism, Alchemy, Hermeticism, and groups following specific teachers such as Jacob Boehme, Rene Guenon, G.I. Gurdjieff, and Adyashanti.

[3] for more information see: http://www.culturalintegrationfellowship.org/

Part of the universalizing principle is a rejection of partisan, sectarian religious tenets that have been integral to the American worldview. The traditional civil religion that saw America as God's new Israel and as the exemplar of absolute good is suffering a crisis of legitimacy. As is the Protestant Ethic—also known as the American Success Ethic—which defines poverty as disreputable and justifies accumulation of wealth. In place of these divisive belief systems that justify social and cultural hegemony without a trace of self-criticism, we find an ethic of community arising in a number of new religious forms. We recognize a dimension of humanity that the modern secular world denies and we acknowledge a quest for direct experience of this dimension, variously referred to as the divine, the sacred, the transcendent, the mysterious, the participatory. In reaction to the emotional blandness of the modern world, an impulse arises to integrate body, mind, spirit, and emotions. Wholeness requires that we honor the teachings of the past through myth and story and discover a sacred dimension to humanity that calls for expression.

Similarly, the impulse toward integral consciousness originates from a higher level of ourselves, a level that is 'esoteric', hidden or inaccessible to us because we habitually identify with a surface consciousness that is fragmented, isolated and alone. How do we search for this authenticity, this integrity of being? One fundamental esoteric principle is that we are not alone, that there exists a locus of conscious energy that calls to us and speaks to us through the diversity of forms we call 'art', 'religion' and even 'science', provided we know how to listen with a more whole, integral self. What we have not understood and what is problematic is that the attention we bring to these areas of interest is always insufficient because it is always the same fragmented attention we occupy daily in our ordinary state. Attention is not theoretical but so long as it evades itself, allows itself to become absorbed in its various momentary interests to the exclusion of its integral potential, we necessarily suffer the consequences of a fragmented and incomplete existence.

All of these impulses constitute a desire for a religion or a teaching that makes a difference in our everyday lives. It is not enough to be a nominal participant in a faith-based institution. Spending one hour on Sunday morning in church, going to High Holy Days each year or observing Namas each day does not satisfy the urge to change one's state of being. To change, to transform, to transmute, to integrate, to individuate are processes that require more than nominal allegiance. They require diligence and energy.

I conclude by citing Jacob Needleman, "What we find in these movements is the hope of a worldview for modern people, a sense of the wholeness and purposiveness of reality within which individual human beings are called to discover their own natural place, bringing with them everything of their minds, hearts, and instincts. This impulse has the virtue of joining the inner life of each person in all its possible levels to the world of nature and beyond, even to the Highest" (Faivre and Needleman, 1995, pp. xxiv-xxv).

In these ways, the deeper aspects of the new religious phenomena represent the reemergence of esotericism in our time and contribute to the foundations of integral consciousness.

Rethinking the Future of World Religion:[1]
A Conversation with Jorge N. Ferrer[2]

Bahman A.K. Shirazi

When it comes to religious consciousness, the turn of the 21st century presents an unprecedented and challenging time in human history. On the one hand, the long-standing chasm between premodern theocentric religious traditions, and the modern anthropocentric, scientistic, and materialistic worldviews is widening. On the other hand, unlike what some may have anticipated, not only religion and spirituality are not on the decline, they are as strong as they have ever been.

Hundreds of new religions, cults, sects, and spiritual communities have emerged in recent decades. These new religious movements, along with globalization of religion, multiple-religion explorations, ecumenical services, religious syncretism, and secular spiritual orientations are among the many trends that shape today's religious landscape. Despite the widespread materialism in a technology-dominated world, we live in times of rich spiritual diversity, experimentation, and innovation. Our postmodern world seems to be evolving at an increasingly accelerated rate. While some are very comfortable moving along at such a fast pace, others, unable to cope with this rapid change, have either resorted back to religious fundamentalism, or have become profoundly confused and disenchanted.

Jorge Ferrer is one of few thinkers who have tried to map out the current landscape: He reflects on whether humanity will ultimately converge into one single religion, or will it continue to diversify into numerous forms of spiritual expression? Or perhaps, a middle path capable of reconciling the human longing for spiritual unity, on the one hand, and the developmental and evolutionary gravitation toward spiritual individuation and differentiation, on the other hand, is more likely?

In this interview he discusses four possible scenarios for the future of religion: global religion; mutual transformation of religions; interspiritual wisdom; and spirituality without religion—*as well as discussing his own participatory vision.*

* * * * *

---

[1] Jorge N. Ferrer presented the four scenarios mentioned in this interview in the spring of 2011 in a keynote presentation at the *Symposium on Integral Consciousness* at the *California Institute of Integral Studies*. These scenarios are further elaborated on in Ferrer, J. N. (2012). The Future of World Religion: Four Scenarios, One Dream. *Tikkun*: *Culture, Spirituality, Politics, 27*(1), 14-16, 63-64.

[2] Jorge N. Ferrer, Ph.D., is chair of the department of East-West Psychology at the California Institute of Integral Studies in San Francisco. He is the coeditor of *The Participatory Turn: Spirituality, Mysticism, Religious Studies* (SUNY Press, 2008). In 2009, he became an adviser to the organization: Religions for Peace, at the United Nations on a research project aimed at solving global interreligious conflict.

BS: *Thank you very much for this interview! I would like to start on a personal note regarding your own background in terms of religion and spirituality. Were you brought up religious or secular? Were you ever part of a religious community?*

JF: I was born in Barcelona, Spain, and was educated in a Catholic school (Maristas la Imaculada) where the object of devotion was not God, but the Virgin Mary. In retrospect, I can see how this impacted my spiritual orientation, which could be seen as more feminine, organic, and embodied than most traditional ones. Thus, I had twelve years of elementary and high school Christian education that was less rigid and more liberal than the one offered by other orders such as the Jesuits.

During my school years, I had some unusual experiences such as states of absorption or trance in the classroom. I remember that a teacher once abruptly woke me up during one of those trances and I broke up crying. I was sent to the school psychologist to see if I was epileptic—which was not the case. Then during my pre-adolescence I had numerous out-of-body experiences. These nonordinary experiences, as well as an increasing awareness of psychological wounds, impelled me to study psychology.

BS: *So you were already aware of these psychological issues?*

JF: I was aware of a number of energetic blocks and associated psychological neuroses by the time I was seventeen years old. I was also fascinated by those nonordinary experiences, so I went into psychology to both try to understand them, and heal myself. Mainstream psychology in Spain was then dominated by cognitive psychology and neuroscience, which provided neither answers to my questions nor any healing. Thus, I launched a personal search through autodidactic study. I read most of Freud's *Collected Works* and from there I went on to read Jung and Fromm. Reading Fromm, Suzuki, and de Martino's *Zen Buddhism and Psychoanalysis* was a turning point in my search. That was my first contact with Eastern philosophies, which in turn led me to Alan Watts and eventually to the field of transpersonal psychology. At that time, I also joined a Hindu meditation group in Barcelona called the Brahma Kumaris—do you know them?

BS: *Yes, they have a center in San Francisco too.*

JF: I was with them for about half a year and had beautiful meditative experiences, but some aspects of the group's philosophy, such as apocalyptic thinking and the belief that "they would be the only ones who would be saved", didn't sit well with me. Since I appreciated Zen, I moved on to study with the female Korean Zen teacher Ji Kwang Dae Poep Sa Nim for a couple of years in Barcelona.

BS: *Were you in college at this time?*

JF: Yes, I was at the university studying psychology. Korean Zen is influenced by both Taoism and shamanism and the practice involved not only meditation, but also energy work, mantras, and magic. I was still nineteen when my teacher proposed to me to move to her center and become celibate for three years. At that time, however, what I actually needed was to explore and heal my sexuality. It was obvious that my Zen teacher, who was supposed to be a psychic reader, 'did not get it'. I left her school, entered psychotherapy, and eventually attended workshops to explore my sexuality, which were deeply healing and liberating. This event is at the root of my valuing my internal spiritual authority over external sources such as scriptures, doctrines, or spiritual teachers. Interestingly, much later I naturally entered a period of almost three years of celibacy that was both effortless and profoundly transformative. All this led me to conclude that a healthy celibacy cannot emerge from a mental or even spiritual imposition upon our primary world, but should rather organically flow from the inner dynamics of our sexual energy.

During this time I also had some very formative experiences with psychedelics. I experimented with combining psychedelics and meditation and continued psychotherapy. When I arrived in the U.S. in 1993, I attended individual and group psychotherapy, and immersed myself in meditation practices such as vipassana at Spirit Rock center and Zen practice with Joan Halifax (who is ordained in Thich Nhat Hahn's Order of Interbeing). For a time, Joan became the closest to having a traditional spiritual teacher I have ever had. At that time, she used to teach at CIIS and I also went to her center '*Upaya*' in New Mexico to do a vision quest under her guidance.

Later on, I connected with Donald Rothberg and became a member of the *Buddhist Peace Fellowship*'s (BPF) *Buddhist Alliance for Social Engagement* (BASE) for a few years, doing volunteering service with homeless Latino women in the Mission district of San Francisco. Thus, for about 10-12 years I was affiliated with various kinds of Buddhist practice from Korean Zen to Thich Nhat Hahn's Zen to Theravadin vipassana and to socially engaged Buddhism. I also attended many talks by Tibetan Buddhist teachers and regularly practiced *tonglen* (giving and taking suffering) and other Tibetan practices, but never studied Tibetan Buddhism formally.

I should add here that right before coming to the U.S. I had my first encounter with the body of work called *Holistic Sexuality*, co-created by Ramon V. Albareda and Marina T. Romero. I was doing a personality study with Ramon when he invited me to a Holistic Sexuality workshop. The workshop was so powerful that for a few years I would go back for more in the summers, sometimes with other CIIS students. This work has been very important for me and provided essential experiential seeds for my participatory approach to spiritual growth. Eventually, I invited Marina to the States and for a few years I became involved in the facilitation of this work at the California Institute of Integral Studies (CIIS), Esalen Institute, Institute of Transpersonal Psychology (ITP), and other institutions. Although Buddhist practice had given me a lot, I experienced a lack of vitality in Buddhist circles that was not nourishing my soul. Holistic Sexuality was the perfect remedy and provided the right balance for my integral practice.

Finally, shamanism has also been very influential in my spiritual practice. Starting from intensive reading on the topic in Spain, I then studied it with Joan Halifax (whose teachings combine Buddhism and shamanism), and worked with Mexican mushrooms and ayahuasca for many years in both the United States and South America. About five years ago, I came across San Pedro (Wachuma) in Peru and felt a deeper calling I had never felt with other plants. Since then, San Pedro has become a very important plant teacher for me.

***BS**: In what way is the future of religion important to your worldview and current work?*

JF: Well, whether in my approach to intimate relations or the way I live by, I have always been naturally attuned to what is next—what is unfolding. I do not get too excited about what has already happened, but more about what is emerging and is new. Thus I am interested in the evolutionary spirituality that Sri Aurobindo, Haridas Chaudhuri, Ken Wilber, and many others talk about—which gives a sense of adventure to both being alive and spiritual inquiry. It is in this context that I am interested in the future of religion.

***BS**: You spoke about four scenarios in your presentation. In the first scenario you talked about* the emergence of a global religion *or a single world faith for humankind—the possibility of a global religion where either one religion will come to dominate others, or a synthesis of many or most traditions will emerge realizing the dream of a global spirituality; and you said that this scenario is not likely. Is this just a hypothetical possibility or is there more to this beyond a desire on the part of some religion for it to prevail over others?*

JF: I think that most religious traditions explicitly or implicitly aspire to have their creed prevail over the rest, because they genuinely believe that it is the best; that is, it represents the highest truth and is good for everybody. In some cases, this attitude (which I have called “spiritual narcissism”) manifests as problematic fanaticism, in others simply as a candid belief. Spiritual narcissism is pandemic and not necessarily associated with a narcissistic personality.

For example, the Dalai Lama is very likely among the least personally narcissistic, but he firmly believes that his particular school of Tibetan Buddhism holds a higher truth than any other Buddhist school or religion. He supports a diversity of religions on psychological grounds (i.e., on the basis that people have different psychological dispositions), but he still believes that it is a temporary situation, and that, after the necessary reincarnations people will come to realize the superior truth maintained by his school.

***BS**: Also for example, in Islam there is a belief that it is the last religion and the last word!*

JF: Exactly. I believe this situation invites us to wake up to the possibility that there might be another way to hold the plurality of religions beyond believing that one must own the highest truth. I don't believe that any of the existing religions will become global, in part because there is tremendous spiritual diversification, even within each religion. For example, which particular kind of Buddhism would prevail, as they are fighting internally over doctrinal issues? And the same is true with other religions.

In my view, the evolutionary move towards differentiation is positive and a sign of spiritual creativity. If spiritual diversification is a good thing, then the whole dream of a global religion becomes both illusory and misleading. If there is anything that might become global, it may take the form of a number of interreligious principles that all good-hearted people might agree upon.

***BS**: Are many of the other scenarios that you talked about more like a reaction to this first scenario?*

JF: Exactly, many are a reaction to spiritual narcissism, the deep-seated belief that one's spiritual choices are best for everybody.

***BS**: Yes, it is like a kind of provincialism—as all of these religions started as local practices.*

JF: Exactly, this is also true with Ken Wilber's proposal in transpersonal and integral studies. He articulates a spiritual meta-framework that is supposed to be universal, global, and truest, so his model functions like a dogmatic religion—the Wilberian-integral religion.

***BS**: You refer to the second scenario as the* mutual transformation of religions, *where religious traditions conserve their identity but are deeply and perpetually transformed through a variety of interreligious exchanges. The distinctive feature here is that religious cross-pollination will lead to spiritual creative unions in which diversity is not erased, but rather intensified. You maintain that this vision is consistent with not only the adoption of practices from other traditions by members of different faith communities, but also with the deepening or re-envisioning of one's own tradition in light of other religious perspective.*

You have given examples of this type of religious syncretism: the Haitian Vodou's blending of Christianity and African traditions or the Brazilian Santo Daime Church's incorporation of the indigenous use of ayahuasca into a Christian container. You maintain that currently this religious cross-fertilization is visibly taking place in interfaith dialogue, the New Age movement, and a number of eclectic and integrative spiritual groups. You have also included in this category the growing phenomenon of "multiple religious participation," in which an individual partakes in the practices and belief systems of more than one tradition, which can potentially result in the renewal of existing religious traditions through cross-cultural encounters

So, this seems to be the next natural reaction to, or movement from, the first scenario. You mentioned that interreligious dialogues are a part of this trend. Many people say that the interreligious dialogues that they have seen are more about stating your case, honoring or acknowledging the other, but sticking to your own truth and boundaries. I was wondering if you were inspired by certain kinds of interreligious dialogues that go further than that and the parties are really mutually interested in one another?

JF: I have read a lot about interreligious dialogue and attended a number of interreligious encounters, including the Parliament of the World Religions and others organized by Religions for Peace at the United Nations.

There are a variety of attitudes within the interfaith movement. What you described is a kind of tolerant dialogue in which people have an interest in each other but there are clear limits regarding how deeply transformative the dialogue can be. In some circles interreligious dialogue moved beyond that. In many cases, for example, Christians not only gain a deep understanding of say Buddhism, but also state that such understanding helped them to recognize aspects of Christianity that they would have otherwise overlooked. In addition, there are increasing numbers of interfaith experiments that move beyond verbal dialogue to include exchange of spiritual practices.

Interestingly, perhaps because of their self-critical postcolonial awareness, Christians seem to be the ones more open to these kinds of deeply transformative exchanges. What I see in the Buddhist-Christian dialogue is that many Christian theologians are ready to transform Christian doctrine through engagement of Buddhist teachings, but this is not always the case in the other direction. In any event, this is the direction I would like to see the dialogue move forward—toward mutual transformations not just at the level of doctrine, but also of spiritual practice. The reason for that is that I believe that different traditions have stressed, cultivated, and developed different human potentials.

***BS**:* *Exactly, each tradition seems to have mastered a certain aspect of reality or a part of the larger whole.*

JF: And this cross-pollination can allow different traditions to remain in their identities and simultaneously be enriched by contact with other religions. One phenomenon that fascinates me is cross-fertilization at the visionary level. There are the levels of doctrine and practice, but what about the visionary, ontological, or metaphysical levels? In some contemporary ayahuasca ceremonies, for example, people access visionary worlds that combine indigenous and Christian motifs. I think we are going to see more of that in years to come. What people bring with them to these dialogs is key, and many involved in interreligious dialogues are practicing more than one tradition.

***BS**:* *Do you think practicing more than one religion is just a temporary phase? Or is it really possible to continue with multiple traditions?*

JF: I think it's perfectly possible. It is well documented in individual biographical cases, but also in the case of entire societies, such as contemporary Japan. Many Japanese people practice a combination of Shintoism, Buddhism, and Confucianism side by side. They tend to compartmentalize it; for example, Shintoism for nature, Buddhism for the self, and Confucianism for politics. On an individual level, Raimon Panikkar's case comes quickly to mind. He was both a Christian priest and Hindu *sanyasin*, and his influential approach to interreligious dialogue emerged from his own intra-religious dialogue.

***BS**: This has also been true in the past, for example, in Southeast Asia the animistic and indigenous traditions are just part of the Buddhist religion today. Buddhism has not washed over them and somehow has incorporated the older traditions into its religious practice, so it's possible that this will continue.*

JF: The phenomenon of "multiple religious participation" is increasing and has been well documented sociologically. For example, Judaism and Buddhism seem to somehow easily go together; many Buddhist teachers in the United States were Jewish by birth and there are many Jewish people who practice Buddhism.

***BS**: One individual explained the reason for this being that in Judaic theology there is not enough explicit acknowledgement of human suffering; and that Judaism tends to be a life-celebratory and God-glorifying tradition. So there is little acknowledgment of personal suffering in Judaism—and thus attraction to Buddhism.*

JF: I do believe that many people have the psychospiritual capability to hold different beliefs and practices in their lives. What we don't know is whether the phenomenon we are seeing now will eventually lead to syncretic religions or more to situations like the one in Japan.

***BS**: It seems that if there is a certain element of truth in any faith, it should withstand the test of time, and the reason for something to disappear would be its inability to hold true over the course of evolution of consciousness.*

In the third scenario you talked about the affirmation of interspiritual wisdom emerging from spiritual teachings, principles, and values endorsed by all religious groups and traditions. You have mentioned a number of people whose philosophy falls under this category such as Hans Küng's proposal for a global ethics, or the work of Christian author Wayne Teasdale who proposed a universal mysticism grounded in the practice of "interspirituality". Additional examples you have given are Beverly Lanzetta's proposal for an "intercontemplative" global spirituality that affirms the interdependence of spiritual principles giving birth to new spiritual paths, and Robert Forman's "trans-traditional spirituality" that feeds on the teachings of all religious traditions but is not restricted by the confines of any particular credo.

This may sound somewhat like the previous scenario, so I was wondering if you could elaborate on the difference? Is this true more at one end of the spectrum or limited to certain individuals? Is it starting to happen more and more?

JF: As you mentioned, this proposal has been articulated by a number of scholar-practitioners such as Brother Wayne Teasdale and Beverly Lanzetta, who were very engaged in the interfaith dialogue. In a way it is connected to the second scenario; their proponents hope or believe that the interfaith dialogue will lead to agreement upon a certain number of spiritual teachings or understandings such as the ethical principles of Hans Küng's Global Ethics. But this proposal goes farther than just ethics to include core spiritual teachings or doctrines.

I am fascinated by this proposal and would like to see it unfold. I can see how this might be more feasible with ethics than core spiritual doctrines, which I'm rather skeptical about, given the huge doctrinal differences among traditions.

***BS**: Küng got his license to teach revoked by the Vatican!*

JF: Still, I could envision that a minimum of core shared principles might emerge in the future.

***BS**: It seems like a pragmatic possibility; as these religious worlds come together, there will be some obvious issues and people can agree upon some shared realities regardless of the deeper end of these philosophies and develop a foundation on that pragmatic level.*

JF: I am a spiritual pragmatist and I'm interested in what works for people. In terms of the validity of doctrines, I also take a more pragmatic approach inspired by the Buddhist teaching of "skillful means" (*upaya*). I posit that spiritual teachings are valid insofar as they work; that is, insofar as they help people become less self-centered, create wholesome communities, lead to better relations with the environment, and so forth. This is connected to my non-objectivist participatory approach to spiritual truth.

***BS**: Do you see a possibility that while on the exoteric side world religions will stay as diverse as they are today, on the esoteric level there will be more mutual understandings in such a way that will influence the exoteric level—the emphasis being on the latter, since I have seen many individuals on the contemplative side fairly easily get along. But do you think that it will affect a larger population and the effect would disseminate through the mainstream traditions themselves?*

JF: I have no doubt that the more mystical or contemplative strands of religions cultivate their traditions' living fire, and that those practitioners tend to become beautiful human beings. But this is different from the perennial assertion that there is greater agreement in spiritual doctrine and truth at the esoteric or mystical dimension of the traditions.

The whole esoteric/exoteric distinction is problematic in many ways. I think that the Schuon-Smith hypothesis is erroneous and it does not stand against historical, textual and phenomenological evidence. Even within a single tradition, disagreements among contemplative practitioners abound. Take Buddhism for example: Zen and Tibetan Buddhist monks strongly disagree about the ultimate nature of reality; are they not considered Buddhist esoteric or mystical practitioners?

Although I question the hypothesis, contemplative practitioners do seem to get along better among themselves than believers who engage in religion on conceptual and doctrinal levels, which tends to lean more easily to fanaticism (and this is not to say that mystics cannot be religiously zealous!).

BS: *I recall from Haridas Chaudhuri's book: Modern Man's Religion, that he made a distinction between the 'universalist individual' within a religious tradition—since all of the major religions have a universal outlook and a person within that tradition could reach or embody the universal teachings, higher ethics and values etc.—and a 'universal religion'.*

JF: My dream or fantasy is that those practitioners get along, appreciate each other, and are engaged in spiritual cross-fertilization, but we know that many are actually trying to convert the other; you know that this happens even within the mystical branches.

So, can we embrace all this incredible spiritual diversity as something positive? Can we contemplate that different traditions may have found different soteriological solutions for the human dilemma, and that they may be advancing the evolutionary creativity of Being in different directions?

If we accept this view, there may be overlapping qualities among traditions, but we don't need to come to identical agreements, truths, or principles. These kinds of (failed) attempts have plagued the religious history of humankind. In my view, the objectivist perspective about spiritual truth underlying these attempts is not very generous regarding the creativity of spiritual unfolding.

BS: *There seems to be strong tendencies to stick to the form of things—the way things are presented on the outer level—and the problem you are talking about is that perhaps we can get along on a more essential level, but there is still a tendency to understand that essence in the familiar forms and not recognize it in the outer forms of other traditions.*

JF: That's true and my sense is that at the essential level there are important differences too. For example, when Theravada Buddhists talk about *sunyata* (emptiness) and Mahayana Buddhists talk about the *dharmakaya,* or Christians talk about God-the-Father, they are talking about radically different things.

BS: *There was a tendency thirty or forty years ago to say that all religions have a common core; it was well intentioned toward bringing about peace.*

But at the same time I have been thinking that certain kinds of layers might exist starting with forms on the outermost level, and then deeper or underlying structures that some phenomenologists are interested in; and then there is the meaning level, and deeper within there is the essence or essential layer. We may not know what 'essence' really means but perhaps 'essence' of, let say, water can take many forms and names in different languages and at the chemical level we refer to it as H_2O*. But when you taste or experience water there may be many dimensions to that experience.*

JF: In my work I advocate for the existence of diversity beyond form, that is, at those essential, cosmological, or metaphysical levels. However, I also believe that we can legitimately talk about a mystery out of which everything arises. Perhaps this mystery is closer to what you call the essential quality of all religions, but as soon as anyone 'essentializes' the mystery in terms of particular qualities (e.g., empty, personal, nondual, etc.), the challenges of spiritual pluralism re-emerge.

BS: *Yes, especially if it is done prematurely. I am still working with a gradient of these different levels in terms of epistemology or ways of knowing with respect to various levels. For example, there is outer empiricism, and also inner empiricism and eventually more direct or immediate ways of knowing pertaining to the innermost levels. So there may be something there, but it certainly is not that simple and they cannot be equalized simplistically.*

JF: Exactly, and it is important to consider that such essence that we may think of as primordial may be also evolving with us through co-creative participation! For example, nondual consciousness might be the origin of things, but that doesn't mean that that's where we want to go spiritually speaking. Taking such origin as a goal might be actually regressive in an evolutionary context. We might be able to access such foundation of existence, but my question is, where do we want to go with that today?

BS: *The last scenario before we get into the participatory paradigm is spirituality without religion. You include in this scenario a number of contemporary developments—from secular to postmodern, and from naturalistic to New Age spiritualities—that aim for the cultivation of a spiritual life free from traditional religious dogmas and/or transcendent or supernatural beliefs.*

You consider postmodern spiritualities, which remain agnostic about supernatural or transcendent sources of religion, and the New Age movement that tends to uncritically accept them, as the two most prominent trends that value the primacy of individual choice and experience, criticize the "received" religious doctrines and authoritarian institutions, and call for a democratization of spirit and a direct path to the divine. Lastly in this scenario, you included modern religious quests, secular surrogates for religion, and *postsecular spiritualities that use mottos such as "spiritual but not religious", "religion without religion," and "believing without belonging."*

Many people nowadays talk about being spiritual, but not religious. What is your own view on the difference between spirituality and religiosity?

JF: My sense is that this distinction has practical value for people who have been brought up in religious contexts that were rather oppressive. In those cases, the distinction can allow such individuals to embrace spiritual values free from dogmatic specters.

Historically, there is a distinction between the terms *spirituality* and *religion*. For example, in the history of Christianity the term *spirituality* came to be used to refer to the more personal, affective, and experiential dimensions of religion— vs. its more communal, cognitive, liturgical, and doctrinal aspects.

But when it comes to judge whether particular groups or individuals are religious or spiritual, the distinction doesn't make much sense. Practitioners from the world traditions are usually considered to be religious, whereas many operating outside traditions identify themselves as "spiritual but not religious". But, to what extent are Christian monks (who in my experience can be non-dogmatic about Christian doctrine) less spiritual than New Age practitioners (who can hold their spiritual beliefs rather dogmatically)? Are those New Age people religious or spiritual? It seems like the dividing line here is between being doctrinal or dogmatic (religious) and practicing a more open-ended path (spiritual), and I think this can be helpful. But at the same time I don't think that we can use this distinction for mapping or categorizing. Why would one want to categorize someone as religious, and not spiritual, if she belongs to an organized religion? That doesn't make sense! But again, the distinction can have practical value for individuals who have been oppressed by an organized religion and want to take up a spiritual path.

***BS**: So, I wonder if the distinction between exoteric and esoteric would be more meaningful in terms of 'religion vs. spirituality', where religious refers to the exoteric level, and spirituality to the esoteric?*

JF: My sense is that the distinction you are referring to does have some validity, but I hesitate to use the terms *spirituality* and *religiosity* as a way to distinguish mystical from non-mystical practitioners. You see, the overwhelming majority of mystics of the past considered themselves to be *very* religious; so who are we to say that they are "spiritual but not religious" according to our modern categories? The distinction is important but I wouldn't use those terms to make it.

***BS**: Are there experiential illuminations that mark the exoteric/esoteric distinction?*

JF: There are actual experiential illuminations, as well as degrees of apprehension of spiritual truths in all religions; but again I would not use these terms as distinguishing categories.

***BS**: In your* participatory *paradigm religious worlds and experiences are understood as co-created and emerging from the interactions of the entire range of human faculties: rational, imaginal, erotic, somatic, and so forth. Here you emphasize a shift from searching for spiritual unity in a global religion organized around a single vision, to recognizing an already existent spiritual human family that branches out in numerous directions from the same creative source. In other words, religious people may be able to find their longed-for unity not so much in an all-encompassing megasystem or superreligion, but in their common roots—that is, in that deep bond constituted by the undetermined creative power of spirit, life, and/or the cosmos in which all traditions participate in the bringing forth of their spiritual insights and cosmologies.*

You have said that in this scenario, it will no longer be a contested issue whether practitioners endorse a theistic, nondual, or naturalistic account of the mystery, or whether their chosen path of spiritual cultivation is meditation, social engagement, conscious parenting, entheogenic shamanism, or communion with nature. The new spiritual common ground will be the degree to which each spiritual path fosters overcoming of self-centeredness and a fully embodied integration that make us not only more sensitive to the needs of others, nature, and the world, but also more effective agents of cultural and planetary transformation in whatever contexts and measure life or spirit calls us to work.

This sounds like a whole-person or integral orientation. So I was wondering if there are participatory models that you are aware of that don't necessarily include this level of depth and breadth, and is that your contribution to bring the whole-person orientation into the participatory paradigm?

JF: Yes, there are various participatory models that emphasize different things. John Heron's work, for example, stresses the political dimension, although he has a holistic view of the person too. My work with Holistic Sexuality is very important here. In this approach, the spiritual path unfolds through the co-creative participation of all human attributes and ways of knowing (i.e., vital, somatic, emotional, mental, contemplative, etc.) in a spiritual power or creative dynamism of life or the cosmos.

***BS**: That seems to be the key as you bring the whole person into the relationship. One can have all kinds of interactions and transactions, and even relationships, without engaging the whole person!*

JF: In the context of a participatory worldview, we could say that everyone *always already* participates in the creative unfolding of life, the cosmos, and/or the mystery. However, we can talk about different degrees of participation and also different gradations of participatory awareness. Owen Barfield's distinction between original (or unconscious) participation vs. final (or conscious) participation was influential for me here. Degree of participatory consciousness is as important as the engagement of the whole person.

Later I learned that other approaches such as integral yoga have similar aims. As you know from our previous conversations, I feel that Sri Aurobindo de-emphasized the importance of the vital world and sexuality for a fully embodied spiritual participation—although I know that Chaudhuri appreciated better the integration of sexuality and spirituality. My sense is that the participatory paradigm is an academic and spiritual sensibility that each scholar or practitioner can shape in unique directions. In general, this sensibility could be said to stress the embodied, integrative, inquiry-driven, and relational dimensions of spirituality.

BS: *One might say that in the traditional religious settings there has been a lot of emphasis on the social dimension; however, the religious traditions do not emphasize the subjective, the inner experiential dimension. In reading some of your works one might think that you emphasize the subjective dimension, the experiential dimension, but you are coming into that in a different way— more consciously.*

JF: It could also be said that my work expands the value of the subjective dimension by including experiential dimensions that have been previously suppressed in religious inquiry, such as the body and sexuality. At the same time, its relational emphasis underlines the inter-subjective dimension of spiritual practice and understanding. Our subjectivity is co-created through inter-subjective engagements.

BS: *Haridas Chaudhuri has this simple teaching on the triadic principle of* uniqueness, relatedness *and* transcendence *that I like a lot. Actually, John Welwood used slightly different terms*—personal, interpersonal, *and* transpersonal *dimensions—for these in the 1980s. It seems like your approach does engage all of these three dimensions, even though it might appear as emphasizing the relational dimension, which has been missing and only recently being emphasized in psychology and psychotherapy?*

JF: Yes, this is great! My work also emphasizes these three dimensions equally as the intrapersonal (i.e., collaboration of all human attributes), interpersonal (i.e., cooperative relationships among human beings), and transpersonal (i.e., interaction between human beings and the mystery) dimensions of participation.

BS: *How about the uniqueness of individuality?*

JF: I talk about this dimension in terms of "spiritual individuation" that emerges from the unique unfolding of the person as it becomes whole and co-creatively engages with the mystery.

***BS*:** *The transcendent aspect seems to have two different dimensions to me. One has been described using the metaphor of the overarching sky, but the other one is the underlying ground that connects everything—as in the case of a tree with the roots, the trunk, and the branches. A tree gets the food and water from the earth, but the air and light come from above; so that transcendent dimension is actually both of these. I wonder what your thoughts are on this issue?*

JF: Yes, the transcendent and the immanent have been usually antagonized in terms of different spiritual orientations, but my sense is that both are equally vital spiritual aspects of the mystery that transcend the person. Thus, my sense is that an integral or fully embodied spirituality requires the individual to be open to both types of transcendence.

BS: Yes, there is an issue here potentially with the mind being the medium of expression, but when you translate that into yogic terms, or Kundalini experiences, it really takes on a different experiential form.

JF: Yes, and I want to stress that the aforementioned polarity is not a duality. Immanent life and transcendent consciousness are two sides of the same coin—they are connected like sides of a Mobius string. This helps to understand why when we open into consciousness deeply enough, a sense of the erotic emerges, and when we delve deeply enough into the body and sexuality, the transcendentally numinous appears.

***BS*:** *Yes, in Sri Aurobindo's Savitri after one goes deep into the core of matter, one experiences light. I guess we will leave that to the Great Mystery!*

What is the role of the Divine Feminine in your view?

JF: The feminine and the masculine dwell at all levels. They exist in the immanent and the transcendent, as well as in all aspects of the human being and all levels of reality.

Because of our patriarchal history, however, masculine values have been privileged over feminine ones, leading to a marginalization of the embodied, vital, and erotic aspects of spirituality. In addition, the masculine and the feminine have been associated to antagonistic spiritual orientations such as transcendence (masculine) and immanence (feminine). Part of our evolutionary challenge is to restore balance both personally and collectively in the spirit of healing and integration.

***BS*:** *Is this part of your second and third scenarios?*

JF: Certainly in the interfaith movement there have been an increasing number of women participating. Of course, participatory spirituality could be seen as stressing "feminine" values such as full embodiment vs. the heart chakra spirituality characteristic of most patriarchal traditions. But again, this emphasis seeks to counter our historical imbalance—the true horizon is integration.

BS: *Lastly, what about the distinction between religious vs. secular? Is that included in your work?*

JF: Let me tell you two short personal stories that will convey my sense of this distinction. First, I remember that members of the Buddhist Alliance for Social Engagement (BASE) would go to meditation centers such as Spirit Rock to invite practitioners to provide service for the homeless. This was not very successful. Everybody had plenty of time for meditation practice (at times, entire months for retreats), but virtually nobody had an hour a week to offer to the homeless.

Second, my brother is a militant atheist and secular humanist who teaches sociology and politics at the University of Barcelona. He holds a scientific materialistic worldview and despises spirituality and religion. However, he fought for women's rights for years and is one of the main proponents of a universal basic income in Spain and Europe—for me there is a profound spirituality in what he is doing! What matters ultimately is what people actually do, not how they define themselves, "secular" or "religious." (I am not questioning here the value of personal retreats but this contrast brought to me this insight very sharply).

BS: Hopefully the secular dimension would be included in the interfaith dialogue as it seems to be missing now.

Thank you very much for your time—it is much appreciated!

JF: Yes, this was a great interview. Thank you!

Transformative Body Practices and Social Change: The Intersection Between Spirituality and Activism

Don Hanlon Johnson[1]

Abstract: This paper examines the intersections of embodied spiritual practices—breathing, sensing, postural awareness, moving, touching—and organizing for social change. The perspectives of two leading revolutionary theorists, Mahatma Gandhi and Wilhelm Reich, provide a basis from which to analyze the importance for body cultivation in addressing social issues. There is an analysis of how traditional practices might be taught in a context which opens the practitioner to the grief of the world and the energy to address it.

Key Words: Somatic Spirituality; Transformative Body Practices; Embodied Spirituality; Social Activism; Mahatma Gandhi; Wilhelm Reich.

The orderly form of this clean title belies the bloody historical conflicts in which various societies have tried to blend spiritual values, physical needs, and social justice. Grand spiritual visions continually veer into a fanaticism which becomes blind to many who are targeted as 'other', even to the point of questioning their humanity. Attention to physical needs collapses into narrow-minded squeezing of the human spirit.

Gandhi knew this. In his long struggles in South Africa and India to invent an Indian identity of freedom and social justice, he kept bumping up against the bitter resentments that turn us against one another even while we desperately seek to join together. It was for this reason that he was virtually obsessed about seemingly minor personal issues of diet, exercise, and sexual control. "It is easier," he wrote, "to conquer the entire world than to subdue the enemies in our body. . . The self-government which you, I and all the others have to attain is in fact this. . . . The point of it all is that you can serve the country only with the body" (Gandhi as cited in Alter, 2000, p.3).

It is astounding to go through his writings and discover how much of his energies he poured into the smallest details of self-cultivation in the midst of world-changing activities with thousands of people. Water cures, mud-packs, herbalism, Western gymnastics, vegetarianism, and other body disciplines are the stuff out of which non-violence (*ahimsa)* was derived and made possible in the face of colonial domination. Gandhi's notion of non-violence was far from passivity, born of intense work with the self, disciplining its automatic reactions, toughening its fibers, learning to bring into clear, useful focus its wild impulses. The truth of being that flowed

---

[1] **Don Hanlon Johnson**, PhD, is the founder of the Somatic Psychology Program at the California Institute of Integral Studies where he is currently a professor. He is the author of several books and journal articles, whose repetitive theme concerns the networks of relationships among individual bodily experience, a sense of self-in-community, and the larger worlds of culture and politics.

from these practices, *Satyagraha*, was truth enfleshed, full-body truth, whose bearers stood firmly in that truth against the purveyors of illusion.

His rigorous attention to the body served the obvious purpose of strengthening the revolutionary for the severe challenges of resistance to violence. In addressing a national association of youth, he said:

> Try to follow my ideals as far as you can. For that we should have a good physique. We have to build up our muscles by regular exercise. But that should not be done to indulge in violence. . . Our ideal is to become tough labourers, and our exercises should be toward that end. (Gandhi as cited in Alter, 2000, p. 16)

A secondary purpose was to discipline the hard edges of emotional reactions that fragment the revolutionary community and keep it from harmonious and effective action. Perhaps the most important dimension of his body concerns had to do with purging the body of the effects of colonization which promoted food habits and medical practices, on top of wanton sexual behavior, that weakened the Indian population. His pleas for vegetarianism and celibacy were based on his arguments that these were strategies of resistance and liberation:

> We have more than an ordinary share of disease, famines, and pauperism—even starvation among millions. We are being ground down in slavery in such a subtle manner that many of us refuse even to recognize it as such, and mistake our state as one of progressive freedom in spite of the triple curse of economic, mental, and moral drain. (Gandhi, as quoted in Alter, 2000, p. 11)

While Gandhi was working to change the conditions of Indians in apartheid South Africa and colonialized India, Wilhelm Reich was addressing the social devastations in Europe that were the results of the Industrial Revolution, pogroms, and unending military conflicts. Despite their enormous cultural, psychological, and spiritual differences, these two men shared a core belief in the central importance of the body in social change.

As a young physician, Reich was shaped both by psychoanalysis, and by Marxist humanism. Freud made him aware of the roots of impotence within the fluids and nervous channels of the psyche. He saw that the innate energies of the organism became so distorted by the family and religion that they lost their capacities to energize a truly free adult, producing instead passive citizens subject to manipulation by charismatic leaders. From Marx, he became aware of the effects of the larger industrial society on the organism, how the conditions of mass populations of factory workers robbed them of their internal sense of agency. Like Gandhi, he understood that the struggle for freedom required intense practices of transforming the body: "As a result of thousands of years of social and educational distortion, masses of people have become biologically rigid and incapable of freedom. They are not capable of establishing peaceful coexistence" (Reich, 1970, p.319).

In the early 1930s, Reich wrote a hauntingly prophetic analysis of how Hitler succeeded so rapidly in mobilizing hordes of people to engage in a mass movement that seemed obviously contrary to the most basic human values. He raises the question of why it was that countless thoughtful people were unable to stem the tides of the apocalyptic tragedies they could see bearing down upon them. From his view, the missing piece in revolutions that doomed them to repetitive failure was the anchor of passivity in the body: "... we set out to show the miscalculation that all freedom-fighters until now have made: *The social incapacity for freedom is sexual-physiologically anchored in the human organism*"[2] (Reich, 1970, p. 346).

Despite profound similarities in their analysis of social impotence, they differed radically in their prescriptions for addressing it. For Gandhi, the inner preparation of the body required severe repression of sexual urges. Reich, by contrast, developed the practice of psychoanalysis in the direction of transforming sexual urges into full-bodied, transgenital orgasm. I use the word 'transgenital' to avoid certain oversimplifications of Reich's bioenergetic psychology into a raw form of sexual release. If one studies his texts carefully, what is at stake is mobilizing the fullest capacities of the body's energies and in contact with other persons. Sheer localized orgasm is for him a deficiency, like gulping one's food. Though certainly rooted in nurturing sexual excitement, the discipline of his work consists in allowing that primal excitation to radiate throughout the entire organism, creating a sense of a fully energized self, a free person grounded in the fullest of his or her agency (Reich, 1972, pp. 318-325).

Like Gandhi, Reich inspired communities of revolutionaries-in-training who still work together to implement his theories for internal transformation with the goal of creating more humane civil societies. Throughout Europe, various communities organized around Reichian personal analytic work focus on bodily energies, combined with pre-natal and peri-natal care, education in early child care, couples counseling, and social advocacy around issues of health and sexuality. The utopian hope is that as healthier children are born and raised, a healthier mass population of more independently minded adults will replace the overwhelming percentage of people who are subject to fascist manipulations.

As one is beset today by the unending debates in US politics about contraception, abortion, gay rights, and uses of violence, the history of Reich's efforts seems all the more relevant. As Reich ended his life scarred by his long experiences of being hounded by psychoanalysts, Marxists, and democratic capitalists, he came to realize that fascism is not a peculiar characteristic of ephemeral political movements in Germany, Spain, Italy, and Japan. It is a universal phenomenon because it is rooted in the human body. When the multiple layers of bodily movements, impulses, and perceptions are not creatively transformed into lives of purpose, mass media and ideologues find it easy to create mass movements based on fear and disorientation.

Neither Gandhi nor Reich achieved enormous successes in the long run. Gandhi was painfully aware that his constant experiments with various strategies of changing himself and changing the nation enjoyed only modest successes. There were the small failures in his attempts to regulate his sexual desires, which may be strangely related to his larger failures as in his tragic inability to forge an alliance with the Muslim communities.

Reich was ousted by every community he tried to join. In 1956, he had been imprisoned in Lewisburg, Pennsylvania, on spurious charges of transporting so-called medical equipment across state border. Shortly before he died there in 1957, the F.D.A. held a medieval-style book-burning of everything he had published.

---

[2] Italics are original.

Although their great hopes are dashed in the ruins of fragmented India and Pakistan, and in the depredations of the West, Reich's analysis of fascism and Gandhi's of colonialism are crucial in getting beyond the tragic patterns of revolutions in which the old oppressed, when they succeed in getting power, regularly become the new oppressors. In her book *On Revolution*, Hannah Arendt (1965) draws out the implications of the fact that the word means 'revolve'. Reich argues that it is not possible to break the cycle without getting at 'the social incapacity for freedom rooted in the human organism.' The repetitive good-willed efforts to create a just social order keep foundering on the shoals of closed-off bodies.

Can we learn from them and move forward taking note of what they missed?

> I am in a workshop with Charlotte Selver, the late founder of Sensory Awareness[3]. We are each standing behind a partner. She is giving us instructions about how to be present to our partner by placing our hands on their shoulders, simply, not trying to do anything, just being there but intricately aware of the fullest possible contact between the contours of our hands and the contours of their shoulders. We do this experiment for some 5-10 minutes. After it is over, one of the touchers complains that her shoulders got a little uncomfortable doing this. Charlotte replies with her characteristically feisty tone of voice, "So?".
>
> Her response hit me like a koan from a Zen patriarch. Here was a 95-year-old woman who had fled to New York when the Nazis first ordered her to wear the arm-band in her German university, who had gone on to wander the world dedicated literally to waking up people to what was happening all around us, living simply and teaching radically, keeping to her task even when deaf and having broken several bones. In that light, her impolite response to a complaint of muscle discomfort was a powerful assault on self-indulgence in a radically embodied way: how could I complain about my tiny aches and pains when the grief of the world was so overwhelming that it needs all the healing we can muster?

In his final years, the late particle physicist David Bohm left his lifelong work to help create more effective communities of social change. He was prompted in that life change by his intimate awareness of the dangers facing us, while bewildered by the difficulties of maintaining collaborative movements towards resolving those dangers. He joined Krishnamurti in developing a web of dialogues around the world to address the seemingly intractable problem of collaboration on social values. In his analysis of entrenched patterns of dominance, aggression, and violence, he found that a primary factor was the forming of false wholes, whose boundaries split people apart. The purpose of the dialogues was to address head-on what they considered to be the heart of those false wholes: the addiction to ideas, particularly 'big' ones—Christian, Islamic, Jewish, and Hindu fundamentalism; Marxism; Scientism; Neo-Capitalism, etc. These big ideas are, he felt, tenacious enough to keep people from mobilizing sufficient unity to transform the radical problems that we all share: global warming's serious threat to the planet, poverty, hunger, violence (Bohm, 1988).

---

[3] For more information on sensory awareness see Selver & Brooks (2007).

Bohm's unique characterization of mass addictions to ideas as the foundations for false wholes led him to become interested in the role of the body as an underlying ground of the fragmentation. Often disguised in fine language and gentle demeanor, the addictions reveal their true selves in bodily comportment. When the ideology is confronted with the ‘other’ from a different 'whole', a delicate veil descends over the face, the eyes narrow, muscles betray at least a slight hardening, a contrived smile appears along with an unctuous tone of voice. Edging too close to the core of the addiction can provoke a hostile response out of keeping with what seems to be the person's warm personality.

Compared to such gifted leaders as Carl Rogers, Eugene Gendlin, Joanna Macy, and many others, Bohm's dialogue methods are not particularly effective. I introduce him here because of his diagnosis of the addictive nature of societal fragmentation. It had an important impact on my own longstanding attempts to study how ideas are generated by, and anchored in, one's repetitive patterns of breathing, moving, tensing, sensing. Emerging as we are from a long history of institutional dualism, it is only very slowly that we are becoming aware of the central role the body plays in the evolution of consciousness and community.

A key person in bringing this theme to the fore was the cultural historian Norman O. Brown. In his seminal book, *Love's Body* (Brown, 1968), he advances this radical revision of the perennial philosophy:

> Union and unification is of bodies, not souls. . . [S]oul, personality and ego are what distinguish and separate us; they make us individuals, arrived at by dividing till you can divide no more—atoms. But psychic individuals, separate, unfissionable on the inside, impenetrable on the outside, are, like physical atoms, an illusion; in the twentieth century, in this age of fission, we can split the individual even as we can split the atom. Souls, personalities, and egos are masks, specters, concealing our unity as body. For it is as one biological species that mankind is one. . .; so that to become conscious of ourselves as body is to become conscious of mankind as one. (p. 82)

When I first encountered this passage, I had a strangely paradoxical reaction. On the one hand it countered the belief in which I had been schooled that it was the soul's abstract ideals—peace, justice, compassion—that would bring humans together. As bodies, we were just windowless monads moving in the void. And yet, I knew from that same schooling that our sorry history is of a succession of idealistic communities using all means possible, including torture and murder, to get other communities to adopt their values, no matter if the cost means rationalizing an abandonment of their own ideals of love and compassion. I began to study how direct work with such intimate realities as breathing, sensing, moving, and touch might loosen the hardpan that anchored such infertile ideological conflicts.

Over some forty years, I have been trying out various experiments aimed at bringing to the fore the consensual bodily matrix in which we engage with others. I have found again and again that people who were ideologically in conflict—Muslims/Jews, Whites/Blacks, Native

Americans/Christian evangelists, atheists/theists, young/old—would find themselves interested in each other if given the chance to work silently and simply with one another, breathing, touching, and moving. Learning to stay connected with the 'Other's' facial responses, or maintaining a gentle tactile contact, or listening to each other's breathing, reduced the charge provoked by abstract preconceived differences, and allowed people to settle into a more primal level of shared values about the grief of the world and focus more on how to ameliorate it than on differences of opinion.

> I am in a workshop which Emilie Conrad Da'Oud and I organized with some fifteen African-American somatics practitioners. Emilie has us in partners. I am standing behind a seated man, a clinical psychologist the same age as I. She asks us to put our hands on our partner's shoulders in simple contact. I do this for some few minutes. At the end, we two exchange feedback. He says at first "I cringed, expecting to be pushed down once again by a white guy. But I felt such relief when I felt you were just there with me".

How to think of the body as a source of collaborative visionary efforts to shape a more just world? What images might galvanize our desires for a more effective way to join with one another?

Richard Niebuhr makes a fruitful distinction between the body as missionary and as pilgrim:

> Our bodies are vehicles of passage, and to make pilgrimage is to exercise our inborn motility. It is in this natural propensity to motion that our future as pilgrims is formed. But to discern this fact properly, we have first to attend to another fundamental trait of our being, a pervasive yet determinate feeling that is a ground tenor accompanying all the music of our activities. I will call this ground tenor attachment to place. (Niebuhr, 1984, p. 8)

Reich and Neibuhr join together: the healthy free adult is mobile, not frozen; and the pilgrim is of necessity mobile. To walk the *Camino de Santiago de Compostela*, circumambulate Mount Kailash, or embark on the *Hajj* one has to be in shape, physically vital, capable of handling the rigors of weather and terrain, knowledgeable about how to carry food and water for the journey, skilled in necessary clothing and footwear. Small rigidities will emerge over the long haul to create serious dysfunctions. In this long journey, the pilgrim needs help from others: the ordinary gestures of food, drink, shelter, and directions; the extraordinary ones in case of emergency. Like the Good Samaritan, the pilgrim's helpers do not inquire into the religious proclivities of the person in need before they offer help.

At the same time, the pilgrim has to develop a sensitivity to place. Because *here* (San Francisco) is not *there* (Kailash). There is a deep meaning in undertaking these journeys; they presuppose that place affects one's spiritual life. The pilgrim is in a position to learn that all spiritual viewpoints are rooted in the places where they evolved: the Sinai desert, the polar tundras, the Amazonian and Southeast Asian rain forests. If place is nothing but an accident of ephemeral reality like one's underwear, if each place is essentially like every other, there is no real point in making a difficult journey.

The missionary is a different being. His or her anchor is neither body nor place, but floating entangled in elaborately defined ideas of salvation and virtue. Places are irrelevant in the grand scheme of eternity. The body is important primarily as the dangerous playground of desire, needing to be corralled. Mobility is not one of their virtues; they are more like stone pillars. Conversations inevitably bump up against a stance impervious to any assault: some usual triggers are homosexuality, contraception, earth-based or tribal spiritual practices, etc. Bring any of these topics forward, and the unchanging responses are predictable.

I paint this hard-edged portrait not as an outside elitist critic, but as one who is recovering from a very sophisticated training as a missionary. I have been a zealot for Roman Catholicism, for Rolfing, for various forms of spirituality. For a good part of my life, I firmly believed that I knew something that others needed to know, and I worked to convince them of such. Only slowly over many years of practice, have I learned to situate myself in my own standing and walking and breathing, here, where I, not you, exist. Learning to inhabit this place, I see that you are indeed a being who knows, if different from me. Perhaps we can walk this land together, even if our notions about it are different. But only if we walk hand-in-hand, sensitive to each other's movements, paying more attention to our rhythms of sound and movement and less to the occasional abstraction.

> *A friend, trained in a discipline called "Authentic Movement,"[4] is on the staff of a company that does diversity trainings for corporations. For some years, he had tried without success to get his team to consider incorporating body movement practices in their work. One week, they had begun a seminar at a company in Albuquerque, New Mexico, where most of the employees are from the Rio Grande pueblos. During the first day, the participants were unusually passive and resistant. In their discouragement at the end of the day, his co-leaders said to my friend that since nothing else was working, he could try some of his body stuff. The next morning he did a long session of authentic movement. At the end, the participants said, now we can tell you our names.*

I conclude by addressing the difficult tensions manifest in history between spiritual idealisms and social justice. In every spiritual tradition there are transformative body practices: breathing, awareness of bodily sensations and reactions, healing touch, sacred dance, whirling, chanting, meditative postures and mudras. The shapes of communal consciousness that emerge from long practice of any of these are not automatically programmed; they are largely shaped by particular spiritual teachings which vary widely. Sometimes, the meditator is encouraged to cultivate the ways in which these practices open him or her to the greater world; often, the direction is more internal.

In the various transformative practices that have emerged more recently in the West, the evocation of the fuller energies of the body into speech and action dictate radical changes in the world itself. Social change is always in the background. The above analyses suggest the importance of shifting the context of these practices from one in which their content is taught within the confines of preconceived sacred writings to one that builds on the opening of the practitioner to the Infinite Unknown within which other persons are situated in their unfathomable depths.

---

[4] For more information see Pallaro (1999).

The negative theology of the medieval mystics, the *Via Negativa*, holds a clue. In the light of carrying any of these processes far enough, the meditator's sense of self and fixed concepts can dissolve in the immensity of the transconceptual, eventually revealing in its depth and density the earth and our fellow beings together, a matrix on which we can craft a better home, a shelter for all in the great storms.

The New Myth: Frederic Spiegelberg and the Rise of a Whole Earth, 1914-1968

Ahmed M. Kabil[1]

Abstract: The present article provides, through the life and teachings of a little-known German scholar of religions named Frederic Spiegelberg (1897-1994), a novel account of some of the unique historical and intellectual developments that converged in the San Francisco Bay Area in the mid twentieth century and subsequently informed and enabled many of the defining chapters of recent global history. Separately, these developments are known as the dissemination in the West of Asian religious perspectives and practices, the San Francisco Renaissance, the rise of the counterculture, the widespread blossoming of environmental awareness, and the information age revolution. Together, they comprise *The New Myth*: synchronous with and in reaction to the planetary spread of technology and the global experiential horizons such technology discloses, a constellation of holistic integral thought emerged in various domains in the West that was characterized above all by a spatiotemporal emphasis on the '*Here and Now'* and the realization of unity through the recognition and transcendence of polarity. The origins, afterlives, and implications of this constellation of thought are only now being discerned. The story of Professor Frederick Spiegelberg's life—little known and largely forgotten—functions as the conduit through which the New Myth's historical and intellectual contours are traced and thereby rendered intelligible.

Keywords: Alan Watts; Counterculture Movement; Cybernetics, Frederick Spiegelberg; Haridas Chaudhuri; Martin Heidegger; Integralism, San Francisco Cultural Renaissance; Sri Aurobindo; Steward Brand; Whole Earth Catalog.

The following article presents a vignette of the life and teachings of a little-known and largely forgotten professor of comparative religions named Frederic Spiegelberg (1897-1994). My central contention is that the path of Spiegelberg's life discloses a constellation of holistic, integral thought and the network of thinkers who disseminated it. The constellation of thought and the network of its promulgation reveal a history of the spiritual revitalization of the West, one undertaken through rediscovering and appropriating the West's shared origins with the East. The goal was to discover a way of being suitable to the age of global technological modernity. I call the network the drive towards wholeness. I call the constellation of thought the New Myth.

Synchronous with and in reaction to the planetary spread of technology and the global experiential horizons such technology discloses, a '*New Myth'* emerged in various domains in the West that was characterized above all by a spatiotemporal emphasis on the Here and Now and the realization of unity through the recognition and transcendence of polarity. These efforts

---

[1] **Ahmed M. Kabil** is a recent graduate of Reed College majoring in history. He wrote his senior thesis on Frederic Spiegelberg, with Dr. Benjamin Lazier serving as his advisor. His primary interests include the history of religious thought, Chinese and Greco-Roman humanities, and postwar and countercultural American intellectual history.
ahmedmkabil@gmail.com

SOME RIGHTS RESERVED

culminated in a convergence of developments during the mid-twentieth century that have informed and in ways enabled many key developments in world history since—most notably the rise of environmentalism and the information age.

A theologian by training and a professor of comparative religions by vocation, Spiegelberg was in a sense an ideal albeit typical scholar, occupying a stable post at Stanford University for three decades with the odd publication here and there before retiring to a quiet life in his Bay Front apartment overlooking Ghirardelli Square in San Francisco.

But Spiegelberg was anything but conventional. His interests ranged far and wide, and East and West. As well versed in Greek and Latin as he was in Sanskrit, Spiegelberg administered Rorschach tests to Indian yogis, dabbled in the ‘dark and disreputable’ arts of alchemy and gnosticism, and exalted heresy and iconoclasm as paths to salvation. He possessed the largest collection of Tibetan ghost traps in the West, and grew convinced that an earlier encounter with the great Indian yogi, Sri Aurobindo, infused him with a divine energy he could summon and transmit in lectures. Spiegelberg warned his followers he was not a prophet, yet made prophecies nevertheless. He spoke of vast changes in store for the world, and believed his endeavors were to play a key part. And he was right.

Spiegelberg stood knee-deep in the currents of East and West at the crucial moment of their confluence. His actions were pivotal in transmitting the strains of Ch’an (Daoist/Zen) Buddhism, Hinduism and existentialism that would influence the Beats, 1960s counterculture, and the developments in technology and environmentalism that followed. Spiegelberg’s story tells of three overcomings; the first, of the spiritual crisis of Interwar Europe symbolized by world war; the second, of the mechanized outlook of postwar cold war American society symbolized by the mushroom cloud; and the third, of the widespread belief that technology was an antagonistic force in the aim of global unity, symbolized by the whole earth.

Many parts of the tale have been told before. But the whole, as history, has not. To be sure, the full breadth of the story, with all the origins, afterlives, and implications is outside the scope of this article. The goal here, then, is to point to key moments in a tale that stretches across traditions, continents and eras. Part I, World War (1914-1945), traces Spiegelberg’s early years as an academic in Europe seeking alternative approaches to discuss the experience of Being, culminating in the crystallization of his seminal intellectual contribution, the *Religion of No-Religion*. In Interwar Europe he found himself drawn to the work of Martin Heidegger in philosophy and Carl Jung in psychology, and brought his unique understanding of both scholars to San Francisco when he was forced to flee Nazi Germany in 1937. Part II, Mushroom Cloud (1945-1957), follows Spiegelberg as a teacher at Stanford and the American Academy of Asian Studies as he becomes one of the principal transmitters of integral yoga, Chan Buddhism, Heideggerian existentialism, and Jungian psychology to the West.

Many of the students and colleagues influenced by his teachings and projects would go on to become key players of the San Francisco Renaissance, 1960s counterculture, and information age revolution. They include Alan Watts, Allen Ginsberg, Gary Snyder, Michael Murphy and Dick Price (who co-founded the Esalen Institute in 1962), and ecologist/futurist Stewart Brand (who spearheaded modern environmentalism and ushered in the digital age through his Whole

Earth projects). Part III, A Whole Earth (1957-1968), examines a lecture Spiegelberg gave in 1958 comparing the ideas of Heidegger, Sri Aurobindo, and the "Beatniks of North Beach" concerning Being and global unity. From there, we see the influence of Spiegelberg's thought on the Whole Earth projects of his student Stewart Brand. The article concludes by comparing two incarnations of the *Religion of No-Religion* in Heidegger, Spiegelberg's teacher, and Brand, Spiegelberg's student, concerning the role of technology in the global age.

Part I. World War (1914-1945)

Born on May 24, 1897 in Hamburg-Harvestehude, Germany to liberal-minded Lutheran parents, Spiegelberg had a fairly leisurely and aristocratic upbringing. He displayed voracity for learning early on, and his father prudently allowed him an unusual amount of freedom in pursuing his interests. The defining moment of Spiegelberg's life occurred when he was a 20 year-old Latin theology student at the University of Holland in 1917. After reading some verses of Rilke, Spiegelberg went on a walk through wheat fields dotted with flowers and had his first spiritual experience. It came as the edifice of his Christian faith was crumbling under the weight of philosophy and the steady pounding of academic rational inquiry.

Staring out on the fields, he perceived holiness as existing everywhere and in everything around him. Past and future receded into the present moment, and the young Spiegelberg's normal categories of ego-bound experience dissolved into "an eternal bliss of the all-penetrating holiness" (Spiegelberg, 1948, p.18). Spiegelberg (1960) called this experience the *miracle of being*. "The moment," he wrote of the miracle of being:

> … that I get over the narrow limitations of my reasoning and feel driven instead to experience the bewildering, monstrous miracle of this our being here and now, in this moment on earth, […] When, instead of raising my eyes to nowhere beyond in order finally to hallucinate some Life Power there; if, instead of doing anything like that, I am puzzled, stimulated, enthused by the hardness of metal, by the clicking of time, by the warmth of your breath, by the sound of my own voice and the movement of my own fingers – the moment that I touch this bewildering, surprising, unexplainable, perfectly miraculous reality itself as an astounding mystery,—*that* is the miracle of being. (p. 53)

He brought this understanding of being and the spiritual experience that informed it with him to the German Academy. He arrived there at a unique time in modern European history. World War I eroded faith in the liberal ideal—an ideal that was supposed to deliver modern man from the dark ages and religious superstitions with its vaunting of the liberal trappings of the rule of law, a constitution, individual liberties, property rights, and a market society. Yet here we were, having marched headlong down the long bloody path from the French revolution in 1789 to the upheavals of 1848 to the aftermath of the bloodiest moment in human history. If this was the path to Enlightenment, it appeared as if the final nirvanic insight would all but confirm Hobbes' words spoken three centuries earlier in *Leviathan* that, rather than promises of life, liberty and property, man's lot was a life "solitary, poor, nasty, brutish, and short."

The result was crisis. "The liberal project," writes Benjamin Lazier (2008) in a study on theology in Interwar Europe,

> … had derived much of its impetus from a confidence in the capacity for human progress, and could not help but falter as the trust proved folly. The war in particular dealt a deathblow to a faith in the progressive moral perfection of man, and in its wake came a post-liberal ethos more at home in crisis than in calm. (p. 5)

In theological circles this ethos manifested as crisis theology. Age-old debates about man, god and world were revived as many of Europe's greatest thinkers broached the crisis of the West through resurrecting the heretical traditions of gnosticism and pantheism to ask whether and why God had forsaken them.

Spiegelberg saw it differently. God had not forsaken us, we in our abstract rationalizing had simply forgotten that he was as near to us as the present moment. "It is," Spiegelberg (1961) later wrote "the instantaneous experience of the Being of Being in all its transcendence in and as this most immediate Here and Now" (p. 22). Through identifying with the fundamental aspect of Being rather than the constricted ego, we experience a world transformed.

The problem, then, was to develop modes of thought that reacquainted us with this fundamental component of our experience since forgotten in the modern age. To do this Spiegelberg turned east. "Today," he wrote in a set of notes from the period, "we realize [the divine reality] has to come from within and beyond. Yet maybe the direction from where to get the stimulation could still be East".[2]

These first inklings of East-West synthesis led Spiegelberg to taking full advantage of the German academy's offerings on windows to the East that at the time were rather extensive. Yet Spiegelberg recognized that one could not turn Eastward and assimilate its beliefs and practices wholesale, and so he found in his Western teachers similar attempts to discuss the fundamental experience of being, here and now, that he experienced in the wheat fields.

Martin Heidegger's thought would ultimately prove the most influential for Spiegelberg, though more so in later years than as his teacher in Marburg. "No other philosopher," he reflected, "seemed to me so immediately related to my own search for the essential answer to the ultimate questions of existence" (Mukowsky, 1976, p.1). In Heidegger he found a true revolutionary, a thinker whose ideas on being (*Dasein*) and the here and now (*hic et nunc*) resonated deeply with Spiegelberg's own experience and were unlike anything he had ever read by a Western philosopher. He immediately drew connections between Heidegger's insights and those of the East, despite Heidegger's apparent fidelity to his Greek and German intellectual heritage. "It was too obvious, to too many of his students," Spiegelberg put it (1960), "that a certain amount of parallels were there" (p. 51).

Spiegelberg started teaching at Dresden in 1927, and it was there that he met Carl Jung. Through Jung's pioneering work on myth, symbols, and the relationship between self and world, Spiegelberg found an interpretive model for comparative religions far surpassing contemporary approaches. Jung determined through his confrontations with the unconscious that the experiences disclosed to him were not random permutations of neurosis rooted in sexual trauma as Freud proposed, but rather transmitted symbols from the unconscious to the conscious mind. These symbols pointed to the perennial experience of man's attempts to balance the complementary facets of consciousness and unconsciousness. As Sharpe (1975) notes, the "recognition, acknowledgement and control of the unconscious by the conscious" is called by Jung the process of individuation, the "process by which a person becomes a psychological 'in-dividual', that is, a separate, indivisible unity or 'whole,' the process of coming to selfhood" (p. 206).

---

[2] Source: Frederick Spiegelberg archives. Note: about Eighty percent of Spiegelberg archival sources are held at Stanford University Archives, and the remaining are held at the California Institute of Integral Studies archives.

The purpose of myth has always been to tell this story of individuation. That is, Jung found that the symbols expressed in his personal experiments and in the dreams and psychoses of his patients shared striking parallels with the myths of myriad spiritual traditions, past and present. He concluded that the symbols disclosed an archetype—"a symbol of the unity of conscious and unconscious and a link between the individual and the cosmos of which he is part" (Sharpe, 1975, p. 207). A Tibetan mandala, for example, is an archetypal symbol signifying the wholeness of the individuated self as a microcosm of the macrocosm of which the self is part.

The two outlooks of Jung and Heidegger informed Spiegelberg's seminal intellectual contribution, the *Religion of No Religion* (Spiegelberg, 1948), first published as a lecture in 1938 at the London Buddhist lodge. Spiegelberg was a refugee at the time, having fled Nazi Germany in 1937 after being dismissed from Dresden for going to a conference banned by the Nazis.

While in London, he serendipitously wandered into "the only Zen Buddhist specialist in England," a brilliant 21-year old named Alan Watts (1915-1973). Watts would go on to become the principal popularizer of Zen Buddhism to American audiences in the 1950s and 60s, as well as the central teacher of Zen to the Beats. In 1937, he was simply a prodigy hanging around the London Buddhist Lodge. He had already written a book on D.T. Suzuki's interpretations on Zen Buddhism, and Spiegelberg found him "an almost superhuman being, a young lad with eyes of an angel".[3]

Spiegelberg begins the *Religion of No Religion* by asserting that the spiritual experience of Being Here and Now is the ground for the forms, symbols and rituals of religions to emerge. These symbols, if they are to be successful, must point to that fundamental experience of the miracle of being as well as to the unity of man and cosmos. Inevitably, the time will come when these symbols become meaningless because they fail to adequately convey the experience to which they point. What results is an iconoclastic reaction in which the symbols are thrown off as illegitimate, because they do not accurately express the miracle of being. But the cycle is ever to repeat itself. Indeed, it is the repetition of this cycle of the change and renewal of the miracle of being that is the history of religions.

The process begins with the *astonishment* or *miracle of being*, in which the individual realizes that God or Being is in all and everything. Following the astonishment is a feeling of *pantheistic mysticism*, "which means here that the limits between the ego and its opposites, such as the cosmos or God, are wiped out, and one all-combining feeling of community spreads over the entire universe" (Spiegelberg, 1948, p. 22). All symbols of God must be abolished, for they can only mean a separation from him. This pantheistic moment results in a *psychological inversion* where that which stands before man becomes an inner reality of what Spiegelberg calls the “all penetrating holiness.” Inevitably, the process repeats itself, as the astonishment of being always culminates in new attempts to reify it through names and symbols: “The paradox of a ‘religion of no-religion’ is produced by the fact that the human mind cannot grasp and realize any feeling or fact without giving it a name” (Spiegelberg, 1948, p. 55). Spiegelberg mentions Zen Buddhism, the burgeoning field of psychoanalysis, and the teachings of Martin Heidegger as three incarnations of the *Religion of No-Religion.*

---

[3] Source: Frederick Spiegelberg archives

The *Religion of No-Religion* was the fruit borne by Spiegelberg’s experience as a refugee, of being forced down to the barest essentials, of holding on to only that which is wholly necessary for survival. It was at once a dialectical theology, a mode of being-in-the-world, and an explanatory tool for the historical trajectory of religious traditions. Spiegelberg saw it more as a passport, a belief of universal currency necessary for safe passage through the coming turbulent Atomic age—an age, he feared, where many would wander futilely in search of home amidst the ruins of the world’s spiritual traditions as visions of mushroom clouds dotted the skies and obscured the divine light. “We are rapidly moving away from traditions and former ways of life that, in a few years, will be no more than distant memories,” he wrote:

> The sudden developments of technology are changing our life beyond recognition. We are passing into an era of unknown experiences, call it the atomic age, or what you will. All that we can carry with us from the past is essential, the things without which men cannot live. And to cross the border safely, we will need some sort of passport that all men will recognize, some belief that has a universal currency. (Spiegelberg, 1968, pp. 18-19)

And so, Spiegelberg made his way to America, bouncing around on the East Coast for a few years before winding up at Stanford University in 1941. He carried little with him but his own ideas. But as we shall soon see, that was more than enough.

Part II. Mushroom Cloud (1945-1957)

At Stanford Spiegelberg grew entranced by the writings of Sri Aurobindo, the 20th century Indian freedom fighter, poet, and sage whose spiritual practice is known as integral yoga. He traveled in India in 1949 on a Rockefeller grant and eventually received *darshan* from Sri Aurobindo. Upon his return, he helped found the American Academy of Asian Studies in San Francisco—a pioneering independent academic institution the likes of which had never existed before. “There was at that time not yet any competition in the way of live Asian studies in America, not even in the Bay Area,” Spiegelberg reflected later. “We did not have at that time any ashrams or Zen monasteries, of which we have so many today” (quoted in Mukowsky, 1976, p. 5).

Indeed, in a *New York Times* book review of D.T. Suzuki’s *Essays in Zen Buddhsim* written the year before the Academy’s founding, Gerald Heard (1950) reacts positively to the promise of Zen Buddhism for American society, yet notes the unsuccessful reception the Eastern faiths typically elicit out of American audiences. He attributes the lukewarm response to the West having “outgrown its medieval regard for contemplation as a high or even respectable vocation” (p. 19).

In the article, Heard singles out the Eastern interpretations offered by Alan Watts, now a 36 year-old Episcopal chaplain at Northwestern, as having “roused little more than a faint esthetic curiosity” (Heard, 1950, p.19). Watts left Europe in 1938 not long after Spiegelberg and went to New York to study Zen. Dissatisfied with his teacher yet still committed to spiritual pursuits, Watts decided to enter the priesthood in 1945 and moved to Evanston, Illinois. And in the priesthood he may well have stayed had not a fortuitous string of events taken place in short succession in 1950. The first was an extramarital affair; the second, his young wife annulling their marriage; the third, getting expelled from the ministry; the last, a letter he received from Frederic Spiegelberg who was charged with starting a graduate institute to open in 1951 geared towards a wide-scale spiritual transformation of the consciousness of the West through the teachings of psychology, Zen Buddhism, and the integral ideas of Sri Aurobindo. Would he like to join him in San Francisco? “Happily,” Alan Watts replied, “Circumstances are so arranged at present that I could come out to San Francisco this winter”.[4]

Spiegelberg then set about calling “a first-rate man” from Aurobindo’s ashram to join him and spread Aurobindo’s message to the West. After some correspondence, the Bengali integral philosopher Haridas Chaudhuri was recommended, who at the time was the head of the Philosophy Department at Krishnagar College in Bengal. “The question was brought to Sri Aurobindo himself,” Spiegelberg recalled. “He approved of Chaudhuri’s coming with us with the word ‘*acha*’ (‘Of course!).”[5]

Two months later, in December of 1950, Sri Aurobindo left his body. In his letter to Chaudhuri inviting him to join him at the Academy, Spiegelberg wrote that Sri Aurobindo “is the guiding light of this earth and the prophet of our age. I believe that the last most important contribution that Sri Aurobindo made before passing was to send you here” (http://www.mysterium.com/aaas.html, p. 4). And just like that, the man who would become the most popular Western interpreter of Zen Buddhism (in Watts) and Sri Aurobindo’s vision (through Chaudhuri) were brought to San Francisco. And here Watts and Chaudhuri would remain until their deaths in 1973 and 1975, respectively.

The Academy was a brazen attempt to expand the consciousness of the West so that the world did not end in a nuclear holocaust. Initially, the institute [Academy] had all the expected struggles, namely, difficulties in acquiring funding and credibility. “Clearly,” recalled Watts (1972):

> We were just another California cult trying to assume the mask of a respectable educational institution. But then—only twenty years ago—it was not as easy to see as it is today that when you make a powerful technology available to human beings with the normal form of egocentric consciousness, planetary disaster is inevitable. Moreover, the point had to be made that the egocentric predicament was not a moral fault to be corrected

> by willpower, but a conceptual hallucination requiring some basic alterations of common sense; a task comparable to persuading people that the earth is round rather than flat. This was very largely the subject of discussion at the weekly colloquium of the Academy's faculty, at which Spiegelberg was the invariably provocative moderator, and which became an event increasingly attractive to San Francisco artists and intellectuals. (pp. 286-7)

The Academy functioned as a hub around which ideas on Being influenced by the East and the interwar scene were promulgated to the Beat Generation. Like their interwar counterparts, the postwar Beats were disillusioned by the mechanized ideals of cold war American society, the "valueless abyss of modern life" (Holmes, 1952, p.10). After World War II, Allen Ginsberg recalled:

> There was a definitive shrinkage of sensation, of sensory experience, and a definite mechanical disorder of mentality that led to the cold war….the desensitization had begun, the compartmentalization of the mind and heart, the cutting off of the head from the rest of the body, the robotization of mentality. (quoted in Conners, 2010, p. 62)

And like Frederic Spiegelberg, they were after "the ragged ecstatic joy of pure being," as they put it, in which "existence itself was God" (Kerouac, 1957, p.195). Through the American Academy of Asian Studies, the Beats saw that the East could provide paths to the experiences they sought.

Here's Michael Murphy, a student of Spiegelberg's at Stanford and the Academy whose life was changed by Spiegelberg's courses on Sri Aurobindo, on what the Academy was like in the early days:

> The electricity then was really enormous. There were some hundreds of students who started to gather around that Academy. In those early days there were a number of poets who contributed later to the San Francisco Renaissance: Gary Snyder used to come to those colloquia, and occasionally Allen Ginsberg. Most people forget this, but a considerable amount of the inspiration for the poetry of the Beat Generation came right through that Academy of Asian Studies. Michael McClure and David Meltzer, Phil Whalen, Ginsberg and Snyder...I would say all of them either directly or indirectly were influenced by Haridas Chaudhuri, Alan Watts and Frederic Spiegelberg, either directly or indirectly, and some of them would be in the audiences of those early colloquia and in those classes. (http://www.mysterium.com/aaas.html, pp. 6-7)

The Academy collapsed by the mid-1960s but its progeny live on today. Michael Murphy established the Esalen Institute in 1962 in the spirit of the American Academy, Spiegelberg's *Religion of No-Religion*, and Aldous Huxley's ideas on human potential; the California Institute of Asian Studies (later renamed the California Institute of Integral Studies) was established by Spiegelberg's colleague Haridas Chaudhuri in 1968; and the Institute of Transpersonal Psychology, where Spiegelberg served on the Board of Advisers, was founded by his colleagues and friends Robert Frager, Jim Fadiman and David J. Hall in 1975.

Assessing its legacy shortly before his death in 1973, Alan Watts wrote:

> The American Academy of Asian Studies was one of the principal roots of what later came to be known, in the early sixties, as the San Francisco Renaissance, of which one must say, like Saint Augustine when asked about the nature of time, "I know what it is, but when you ask me, I don't." I am too close to what has happened to see it in proper perspective. I know only that between, say, 1958 and 1970 a huge tide of spiritual energy in the form of poetry, music, philosophy, painting, religion, communications techniques in radio, television, and cinema, dancing, theater, and general life-style swept out of this city and its environs to affect America and the whole world. (Watts, 1972, p. 284)

Spiegelberg maintained his post at Stanford during his tenure at the American Academy of Asian Studies, where he could oscillate between the roles of spiritual teacher and professor depending on the situation. If an impressed student in one of his introductory courses to comparative religions at Stanford stayed after class asking for more, Spiegelberg directed him or her to the “Beatniks of North Beach.”

Such was the case in 1957 when a young student from his comparative religions class approached him asking where he could find people who thought this way.

> “Oh, well you’ll find none of that in Stanford,” Spiegelberg chuckled. “When I want the news, I don’t look for it in the paper. I go to the poets.”
> “What do you mean,” the student asked.
> “North Beach,” Spiegelberg said after a pause. “Go to North Beach.”
> And with that, young Stewart Brand made his way to North Beach. And in a sense, he never left. (Steward. Brand, personal communication, December 13, 2010)

Part III. Whole Earth (1958-1975)

How to describe those strange things that happened in the decade we call the sixties? To say nothing of the unprecedented global upheavals, wars, crises, movements, and protests, how to describe the sequence of events that led to the technologies of the military industrial complex merging with the ideas of the counterculture to inaugurate the information age? How to describe the shift in the attitude towards the boogeyman of technology, long-seen as an instrument of government control and worldwide uprooting and annihilation, now seen as a tool of personal liberation and global unity? How do we account for the fact that, for the thinkers of the drive towards wholeness in the 1960s, technology, systems theory, integral yoga, Zen Buddhism, and psychedelic experiences all came to be seen as methods to bring about a consciousness of “the miracle of this, our being here and now”?

A Liberation of Earth and Being through Technology

In an essay based on a lecture given on August 21st, 1958, Frederic Spiegelberg used the example of the Beats to compare Martin Heidegger’s thought with that of Sri Aurobindo. Speaking on the occasion of Sri Aurobindo’s centenary birthday, Spiegelberg’s goal was to show that the ideas of Aurobindo and Heidegger were compatible and manifested in the example of the Beat Generation. Time was of the essence for the ‘Beatniks of North Beach’—as Spiegelberg called them. They were no longer a secret now that Jack Kerouac’s *On the Road* (written in two weeks in April 1951 but left unpublished until 1957) was a mainstream cultural phenomenon. In the essay, he groups Heidegger and the beatniks together by virtue of their shared central message: an emphasis on the ‘here and now’ and directly experiencing the present moment. Both Heidegger and the Beats hold that the rational mind is overemphasized, and here Spiegelberg feels they share the outlook of Vedanta and Aurobindo particularly. Spiegelberg also wanted to use the examples of Aurobindo and the Beats to broach Heidegger’s new ideas on technology. Indeed, since Heidegger’s (1927) publication of *Being and Time*, his writings took an increasingly mystical turn as he devoted more and more of his attention to what he called the question concerning technology. As he had before, Spiegelberg drew attention to the “Zen-like” quality of Heidegger’s message, yet also found in him a global vision that strikingly called to mind Sri Aurobindo. Heidegger had not yet been translated to English, but Spiegelberg nevertheless engaged in a detailed exposition on the congruence of thought between Aurobindo, Heidegger, and the Beats using his own translations of Heidegger’s (1977) work. In his essays in *The Question Concerning Technology* Heidegger, mysteriously speaks of a saving power in the essence of the danger of technology, and associates this saving power with the coming to presence of a god. “But where danger is,” writes Heidegger quoting the poet Holderlin, “grows the saving power also” (p. 28). Only when we can reach the insight of how technology enframes us, how technology challenges us forth to order the world as standing-reserve, do we see how the truth of Being is hidden from us (Heidegger, 1977, p. 48). It is only once we can discern that “all mere willing and doing in the mode of ordering steadfastly persists in injurious neglect [of Being]” that we are free to “give utterance to insight into that which is”…When we give utterance into that which is, “it is the constellation of Being that is uttering itself to us” (p.48). “Will we correspond to that insight,” asks Heidegger, “through a looking that looks into the essence of technology and becomes aware of Being itself within it?” (p. 49).

Esoteric remarks, to be sure. Spiegelberg understood Heidegger’s ideas on the saving power as countenancing technology as a tool to achieve Being’s task of liberating earth. In this Heidegger strongly echoes Aurobindo’s ideas on global unity. Comparing the two, Spiegelberg believes they both share the same understanding of *Dasein* (being-there). Spiegelberg feels translating this term to Being in English is inaccurate. It is, rather, “the be-power itself” (Spiegelberg, 1960, p. 53). In Aurobindo’s schema, the equivalent term would be *sat* (pure or absolute Being) rather than *bhava* (existence/being).

“It is the essence and key word of Heidegger’s existentialism,” Spiegelberg writes. “Everything is *Sein*. And there cannot be anything that is not ultimately a part of that all-comprising Beingness. Even becoming is an expression of Being. This statement can be found in Aurobindo” (p. 53).

The limited personal subjectivity of the ego veils man from understanding the divine as Aurobindo’s gnostic being. As such, the world’s spiritual traditions have declined and the miracle of being is forgotten because of man’s rationality. For both Heidegger and Aurobindo, writes Spiegelberg, there is only one hope. Here, they both quote Nietzsche’s idea of the Superman:

> When it comes to testify to a mentality that is greater than the degenerated mentality in which we find ourselves as a whole in this century, superman is called for, and to

> characterize him we must say he will have true existentialist mentality, which looks for the direct experience rather than for the taming of reality by our mentality. This superman will have to be more daring than any man who ever walked. And therefore, because he is more daring, he will be able to say more. (Spiegelberg, 1960, p. 54)

For too long we have cried for individual salvation, thinking only of ourselves in the constricted terms of our egos, when our task has been otherwise. “What is the task then, if it is not man?” asks Spiegelberg. “Aurobindo and Heidegger have the same answer: the earth.” For both Heidegger and Aurobindo, “Earth needs man to liberate her, maybe even Being itself. *Dasein* needs man” (Spiegelberg, 1960, p. 55).

Heidegger and Aurobindo agree that because all is *sein*, because all is *sat-chit-ananda*, nothing is to be thrown out or rejected. Everything has meaning as expressions of *Dasein*. Spiegelberg then draws a link between the Vedantic understanding of the divine play of Brahman, *lila*, where the divine plays hide and seek by searching and finding itself through us (coming to consciousness of itself), with Heidegger’s notions that “*Dasein*—Being itself—comes to self consciousness in our own longing”(p. 58).

We do not need to escape technology to achieve Being’s task of liberating earth, Spiegelberg says of Heidegger:

> The world of science and technique does not at all preclude a jump beyond itself, says Heidegger. We do not have to get away from civilization, to do away with all our gadgets and with the all-too-fast progress of technique and science. Rather, the more you go into science, the more you talk to the great men of science, the more you meet an awareness of the mystery, the more it becomes possible to take science itself as a jumping board. It does not any more today seem that science would drive us away from the opening of the greater gates toward higher realization. Aurobindo in his *Savitri* has said that many times. He agrees completely with the existentialist message as Heidegger presents it (Spiegelberg, 1960, pp. 58-9).

In the essay, Spiegelberg provides his own translation of Heidegger’s quote of the poet Holderlin concerning Being’s task of liberating earth:

> *Earth. Is not this what you long for?*
> *To be resurrected invisibly in us.*
> *Is it not your dream one day to become invisible?*
> *Earth invisible.*
> *What, if not transformation*
> *Would be your urgent task?*
> *Earth – O Beloved One,*
> *I will*
> *(*Spiegelberg, 1960, p. 55*)*

The Iconoclasm of Stewart Brand

Stewart Brand has dipped his finger in many jars. As Andrew Kirk (2007) notes:

> [Brand] was present at, and instrumental in, the creation of the American counterculture, the birth of the personal computer, the rise of rock and roll, the back-to-the-land and commune movement, the environmental movement, and a crucial reorientation of western politics. He was an experienced LSD veteran before practically anyone had heard of the drug and advocated a new view of the earth that set a standard for how six billion people view their home world. (p. 31)

Indeed, it was his role in spearheading NASA to release images of the earth from space in 1968 that will stand as perhaps his greatest legacy. Poole (2008) has called the initial instance of man seeing the whole earth as the defining moment of the twentieth century (p. 198). The sight prompted a revolution in the global imagination, and furthermore, catalyzed an understanding of the interdependent relationship between man and his environment:

> The sight of the whole Earth, small, alive, and alone, caused scientific and philosophical thought to shift away from the assumption that the Earth was a fixed environment, unalterably given to humankind, and towards a model of the Earth as an evolving environment, conditioned by life and altered by human activity. (Poole, 2008, p. 198)

For Brand, the whole earth was an icon, one he hoped would supplant the mushroom cloud as the dominant lens through which we saw the world. In this iconoclastic overcoming, Brand exemplifies Spiegelberg's *Religion of No-Religion.* As an icon, the whole earth symbolized two facets of Brand's philosophy: first, a holistic, integral, microcosm-macrocosm understanding of reality expressed through cybernetic whole systems theory that sought to overcome eternally troublesome distinctions between, among other things, man and his tools, organisms and artifacts, and self and world; second, the conviction that technology, when used appropriately, can function as a tool for personal liberation.

Brand took a course on comparative religions with Spiegelberg at Stanford in the fall of 1957 when he was 19 years old. It stands as his first exposure to the Eastern idea systems that, along with his ecological studies and the use of psychedelics, informed his cybernetic systems-based understanding of the world. In examining his notes from his course with Frederic Spiegelberg, Brand appears most struck by the paradox of unity within polarity and the various means to express that paradox, such as the symbol of the mandala and the Ch'an (Daoist/Buddhist) notions of *yin*, *yang*, and *Dao*. He quotes extensively from Carl Jung and Richard Wilhelm's (1931) *Secret of the Golden Flower*. The boxed exclamation points after the quoted passages appear to register the shock of influence. The trajectory of his later life and projects confirms it.

A noteworthy quote speaks of Jung's notion of "outgrowing," whereby an individual may outgrow an insoluble problem through "raising…the level of consciousness." From a wide view, the insoluble problem "lose[es] its urgency."[6] For Jung, "[t]he greatest and most important problems of life are all fundamentally insoluble. They must be so, because they express the necessary polarity inherent in every self-regulating system. They can never be solved, but only outgrown.”[7]

---

[6] Source: Frederick Spiegelberg archives

Brand would seize upon this notion of the polarity inherent in every self-regulating system. Though here applied to the individual, the idea applies in the *Golden Flower* to the cosmos at large:

> [The philosophy of *The Secret of the Golden Flower*] is built on the premise that the cosmos and man, in the last analysis, obey the same law; that man is a microcosm and is not separated from the macrocosm by any fixed barriers. The very same laws rule for the one as for the other, and from the one a way leads into the other. The psyche and the cosmos are to each other like the inner world and the outer world. Therefore man participates by nature in all cosmic events, and is inwardly as well as outwardly interwoven with them. (Jung & Wilhelm, 1999, p. 11)

Hence, the polarity inherent in the self-regulating system of man the individual is the same as that of the self-regulating system of the world at large. If this sounds familiar, it’s because it’s a hallmark insight of cybernetics and systems theory—the very approach Brand would later vaunt in his *Whole Earth Catalog* (1968).[8] Here the cybernetic insight is expressed almost verbatim, but in a spiritual context. This spiritual expression of the polarity in every self-regulating system stands as Brand’s earliest known exposure to systems theory.

Embracing the potential of technology as a tool for personal liberation, Brand and Spiegelberg each collaborated with the Stanford Research Institute (SRI) and Douglas Engelbart’s

[8] A word on cybernetics: In the early 20th century, the sciences came to grapple with the breakthroughs in quantum mechanics that tore asunder the Classical Newtonian paradigm of physical processes. From out of the wreckage emerged the field of thermodynamics unscathed, and with it the principles that gave birth to the whole system models of the ecosystem and biosphere. The whole system model eschews the traditional boundaries between organic and inorganic entities by centering them within the supraentity of the system, of which they are mutually formative. According to this line of thought, there’s no distinction between organism and artifice because both are self-organized and self-regulating, reflecting a certain systemic wholeness. Out of whole systems theory emerged cybernetics in the postwar era, and through its study of information, communication, and feedback reframed the ecosystem conceptual tool in techno-scientific terms. By focusing on behavior rather than structure, cybernetics founder Norbert Weiner placed organisms and self-directed machines in the same order on the basis of the “purposeful behavior” that both share. Weiner saw in information feedback the mechanism by which entities fight entropy. Systems use information feedback to maintain dynamic equilibrium, or homeostasis. Cybernetics demonstrated the potential for systems to go awry by way of positive feedback loops. The techno-scientific discourse of cybernetics reframed the debates of various fields in terms of information feedback. In the sciences, cybernetics met with ecosystem theory and redefined organisms as self-regulating machines. When applied to social systems, we begin to see the far-reaching implications of positive feedback: unless variables within systems respond to one another through communication, feedback, and circular causality within the set limits, system failure may result in the form of, say, an escalating nuclear arms race.

Augmentation Research Center (ARC) separately over the course of the 1960s.[9] Spiegelberg's friendship with Stanford psychologist James Fadiman and SRI Research Engineer David J. Hall led to consulting opportunities and eventually to Spiegelberg serving on the Board of Advisors for their Institute of Transpersonal Psychology in the 1970s. Brand, for his part, hung out often with the community, and was videographer for Douglas Engelbart's infamous "Mother of All Demos" event in 1968 that showed off the framework of tools that would one day become the personal computer.

Most interesting is a project Spiegelberg collaborated on with the Stanford Research Institute in 1969. Titled "Computer Processing and Bibliography of Literature Related to Voluntary Improvement of Individual Performance", the project had as its aim the production of a global network of research information exchange concerning literature on yoga, meditation, "physiological feedback training," "altered states of consciousness," and "other subjects related to voluntary improvement of individual performance."[10] As a consultant to the project along with Haridas Chaudhuri, Spiegelberg was tasked with providing direction in assessing a literature that was global, ancient, immense and "poorly classified." The idea was to use the latest technologies of SRI and SRI's Augmentation Research Center both to create and catalogue the information service as well as to perform a series of experiments relating to that literature. SRI had just become one of the first four nodes on ARPANET, the forerunner of the Internet.

Why yoga and meditation? A few reasons: The first was, simply, to catalyze a mode of being suitable to the modern technological age, one that could lead to the "voluntary improvement of individual performance." Here, from the research proposal:

> Improvement of human performance has for some time been one of the prime aims of our technology. This has been achieved, in our society, largely by providing the human with significant tools and automation procedures that, with proper training, augment his abilities to perform […] The goals of our technological culture at this time are epitomized by our exploration into outer space, such as our landings on the moon and other technological feats requiring a high degree of skill and expertise in controlling our external environment… However, for the exploration of the inner man, our educational concepts, training methods, and research, seem less suitable[11]
>
> 'Far out' is the only adequate term that could encompass the long-term goals of the project. Through cataloging, researching, and integrating all the data on yoga, meditation, and altered states into an information system, the engineers hoped that man would soon, through mastery of yoga, reach the ability to control computers directly through the voluntary use of brainwave signals.
>
> Studies will undoubtedly soon be carried out using these physiological instruments in conjunction with computers, in the most advanced type of man/machine communication and human augmentation system we can imagine […] Many years may pass before

---

[9] ARC and SRI, along with centers on the East Coast, were hubs of innovation that ushered in the information age.

> significant progress and useful results can be produced in the control of computers directly from brainwave signals. In the meantime, it would seem prudent to explore the use of yoga, meditation, and other techniques as a means of developing the brainwave control that will be necessary for the direction of computers.[12]

While Spiegelberg was getting his computer kicks, his student Stewart Brand was becoming a celebrity. His "Why Haven't We Seen a Photograph of the Whole Earth" campaign put him in the papers, and his *Whole Earth Catalog* (first released in November 1968) was a tremendous success. By 1971, at the height of the project's success, Brand decided that the time had come to move on, "just to see what happens." After all, he realized that his catalog would soon become an artifact of its own. As he would several times in his life, Brand presciently understood that he stood at the forefront of a constellation of changes to come, and wanted to describe what he saw there. After bumming around the computer programmers at SRI and MIT, Brand declared in a 1972 *Rolling Stone* article that Ready or not, computers are coming to the people.

Brand's (1971) *Last Whole Catalog* was his most successful, winning the National Book Award in 1972 to the horror of book critics everywhere. He decided to throw what he called the "Whole Earth Demise Party," to be held at the lavish and expansive Palace of Fine Arts on June 14th, 1971. Anyone who had anything to do with "making" the Whole Earth Catalog was invited. Expecting a raucous bash, thousands packed the auditorium with all the countercultural trappings, regalia, and contraband. Brand wandered around barefoot in a monk's black Cossack meeting and greeting. But the reason for the party soon emerged.

At 10:15 pm, the director of the event, Scott Beach took the microphone and addressed the audience. He held up a thick wad of cash - $20,000 in *Catalog* profits. "There is to be a consensus of opinion on what to do with the money," Beach directed. "And then the money is to be signed over to one person, to do whatever is decided" (Lopez, 1971, p. 1).

With that, Stewart Brand stepped back and observed. He was aiming to make a point about the counterculture, that it "wasn't ready to do much of anything"; and for most of the evening, and for some time after, it would appear Brand proved his point. "Burn it!" cried some. "Flush it down the toilet!" cried others. The sum was reduced to $15,000 after a participant made off with the money. "Brand stood on the stage with a straight face," an article at the time noted, "writing every suggestion on the blackboard" (Lopez, 1971, p. 1).

By dawn, Brand was asleep on the floor, "with the smile of a man at peace with himself, satisfied that his ploy had revealed more about the values of the counterculture than the contents of his magazine – the magazine that had become so much a part of it" (Lopez, 1971, p. 1).

Perhaps 100 people remained. The decision was finally made by vote: The remaining $15,000 would be given to a young man nobody knew named Frederick L. Moore, Jr. "Most guests said they had not seen Moore before the party," the article reported. "'But we know him because he introduced himself,' one girl explained. Moore gave his occupation as 'human being' and left in a van" (Lopez, 1971, p. 1). "Stewart Brand just shook his head," Markoff (2005) reports. "It had been an interesting experiment, but he never really expected to see Moore again. *Maybe he'll send a postcard from Mexico*, Brand thought as he left the Exploratorium" (p. 237).

---

[12] Source: Frederick Spiegelberg archives

Throughout the night, Moore made his way to the open microphone struggling to make his voice heard about the personal and collective empowerment that comes through sharing information:

> If we are going to build a change—in a changing new world, or whatever we want to call it, 'new age,' then it's going to be because we are going to work together and we are going to help each other… We feel that the beginning of a union of people here tonight is more important than letting a sum of money divide us. (Markoff, 2005, pp. 236-7)

And with that, Frederick Moore and $15,000 made off into the night—or early morning, to be exact. In the spring of 1975 he catalyzed what would become the personal computing revolution through cofounding the Homebrew Computer Club with the *Catalog* profits. The club, writes Isaacson (2011), "encapsulated the *Whole Earth* fusion between the counterculture and technology" (p.60). From the first flyer: "Are you building your own computer? Terminal, TV, typewriter? If so, you might like to come to a gathering of people with like-minded interests" (p. 60). Perhaps Brand was mistaken. Maybe the counterculture was ready to do something.

An engineer at Hewlett Packard saw the flyer and showed up to the meetings in cofounder Gordon French's Menlo Park garage. He was incredibly shy and nervous, yet undeniably brilliant. His name was Steve Wozniak. Soon, he'd start bringing along his old friend from high school, a bearded and impetuous acidhead with a messianic complex, fresh from a trip to India motivated by Dr. Richard Alpert's (1971) *Remember, Be Here Now*. His name was Steve Jobs.

And the world would never be the same. Because the people who are crazy enough to think they can change it, are the ones who do!

Conclusion

I have said that Spiegelberg's is a story of three overcomings: of the spiritual crisis of Interwar Europe symbolized by world war; of the mechanized outlook of postwar cold war American society symbolized by the mushroom cloud; and of the widespread belief that technology was an antagonistic force in the aim of global unity, symbolized by the whole earth.

Through an emphasis on Being, the '*Here and Now*', and the realization of unity through the recognition and transcendence of polarity, the thinkers on the network of the drive towards wholeness sought to establish modes of being suitable to the technological age of global modernity that transcended the dominant approaches in the West that Martin Heidegger called calculative thinking.

Certainly, Spiegelberg's understanding of Heidegger was unique. Nihilism and pessimism are hallmarks of Heidegger's thinking, and the notion that technology could aid in man's task of liberating earth (and thereby Being itself) seems far out of line with most Heideggerian interpretations. Indeed, it seems plain far out. And if Heidegger were here I suspect he would disagree with Spiegelberg's interpretation. Cybernetics, viewing the world as system, seeing technology as a tool—all of these epitomize for Heidegger the very apotheosis of calculative thinking in the modern age. But then, we're still left with those curious comments on the saving power in the very essence of technology. Here is not the place to go down such a rabbit hole (and it is a rabbit hole, be assured of that).[13]

Regardless, the contrasting yet complementary views of Brand and Heidegger live on in what Benjamin Lazier (2011) dubs the Earthrise Era—the age inaugurated by images of the Whole Earth taken from space that Brand in large part catalyzed. Cosgrove (2001) elucidates this nicely when he contrasts the two discourses that have framed the Apollo images since the 1970s, the "one-world" discourse, on the one hand, and the "whole earth" discourse, on the other:

> A "one-world" discourse […] concentrates on the global surface, on circulation, connectivity, and communication. It is a universalist, progressive, and mobile discourse in which the image of the globe signifies the potential, if not actual, equality of all locations networked across frictionless space. Consistently associated with technological advance, it yields an implicitly imperial spatiality, connecting the ends of the earth to privileged hubs and centers of control. (p. 263)

Here we see Heidegger's concerns well represented, echoing statements he made as early as the 1930s.[14] But in the one world discourse we also see the cybernetic systems view of reality epitomized by Stewart Brand—a world viewed in terms of interconnected networks. Now, Consider Cosgrove's (2001) definition of the "whole earth" discourse:

> A "Whole-Earth" discourse stresses the globe's organic unity and matters of life, dwelling, and rootedness. It emphasizes the fragility and vulnerability of a corporeal earth and responsibility for its care. It can generate apocalyptic anxiety about the end of life on this planet or warm sentiments of association, community, and attachment. (Cosgrove, 2001, pp. 262-3)

Here we see implications of rootedness associated with the images, rootedness of the sort Heidegger claims has been lost in modernity. This reciprocal interplay between the two discourses lies at the heart of our modern attitude towards technology. Spiegelberg allows us to see the interdependent nature of one world and whole earth, and how we came to live in both at once.

---

[13] Recall, for example, Spiegelberg's lifelong comparisons of Heidegger and Eastern thought. Recent studies have conclusively demonstrated that many of Heidegger's central concepts—those that would establish him first as philosophy's secret king and then, after his ascension, as arguably the twentieth century's most important thinker—were lifted in secret and at times wholesale from German translations of East Asian texts. These include ideas on Being (*in-der-Welt-sein*, *Dasein*), nothing, emptiness, and the clearing, and the conceptual centerpiece of his arguments on technology, enframing (*gestell*). Heidegger displayed a systematic method for concealing East Asian concepts in Heideggerian garb until scarcely a trace of the original source material remained. Heidegger's appropriation allows us to understand how Spiegelberg could claim in 1976 that "no other philosopher […] seemed to me so immediately related to my own search for the essential answer to the ultimate questions of existence" (Mukowksy, 1976, p.5). It renders understandable Spiegelberg's lifelong suspicion that Heidegger was influenced by some degree by the East. And it lends credence to Spiegelberg's unique interpretations of Heidegger's work.

[14] See Heidegger (2000), p. 40.

Heidegger reminds us of the dangers of technology. And they are real dangers. But the simple fact remains that, even if it's a whole earth disclosed by the very process he assails, it is one that can and has instilled the rootedness he feels has been lost in modernity. Where the danger is, grows the saving power also. Yes, we live in one world, with all the planetary imperial spatiality that goes along with it. But we also inhabit a whole earth.

Much ink gets spilled over Brand's remarks in the opening pages of the *Whole Earth Catalog* that "We are as gods." (Why 'gods', and not god? Is the statement alluding to the Greek deities? Perhaps the Zen conviction that we are all endowed with Buddha nature?); We would do well, however, to remember 'Genesis', specifically 'the Fall'. Adam and Eve, having eaten the fruit of the tree of knowledge, became "as gods, knowing both good and evil."[15]

This has been the story of a peculiar tree of knowledge that bore some strange fruit. Certainly, few wound up taking a bigger bite than Steve Jobs. But the central seed sower was Frederic Spiegelberg, who experienced a miracle while walking in the fields that he spent the rest of his life trying to remember. Remembering that miracle is also what this story is about. Each of these thinkers did so in their own way, and each for their own reasons. "It's all the same, it's all the same," wrote Richard Alpert in1971; "Any trip you want to take leads to the same place." The miracle is always the same, and so the lesson is always the same:

Remember, *Be Here Now*.

The Future History of Consciousness

David Hutchinson[1]

Abstract: Consciousness is the key fact of life, yet the study of it is in its infancy. Spirituality and science both hold valid truths in this field, and they are bound to meet in a practical sense as science is moving rapidly into the subjective areas such as dreams, thought processes, and awareness. We are on the edge of a momentous shift in knowledge and ability with consciousness, driven by exponential change in theory and technology.

> "The only way of discovering the limits of the possible is to venture a little way past them into the impossible." (Clark, 1962, p. 32)

For every one of us, the experience of consciousness is the key fact of life—its highs and lows, agonies and ecstasies, beauties and transcendences, poetry and squalor, fears and loves, the tingle and spark and slap of every moment. Experience happens to the individual, and is filtered through billions of unique bodies and minds. For millennia, the turn and shape of consciousness has been a personal matter, subject only to the influences on an individual: reading, thought, diet, illness, drugs, meditation—but no more. The times are changing, and the twenty first century will see a revolution in the way we understand, work with, and experience consciousness. We can prepare for it, brace ourselves, use it wisely, or let the rising swell sweep us out to a vast and uncharted sea.

The understanding of consciousness and the mind is in its infancy today, especially as it relates to technology. Tools to analyze the brain at the working level of neurons are just emerging, and maps of the brain are about as detailed as Columbus used when sailing out for the New World. But watch out. The future is tapping on the windowpane, asking to come in. Neuroscience, computational models of cognition, and analytical tools are racing ahead, but nobody knows what is around the next turn.

Technology is not a settled field; I suspect it never will be. It is moving too fast, and its knowledge and effects are multiplying at an exponential rate. Nobody knows what will be possible in fifteen years, much less a thousand. A thousand years from now there will be human beings, but will they have the same limbs and organs as today? Will they have new senses, augmented brains? What will they think, dream, imagine? What stories will they tell their

---

[1] David Hutchinson has degrees in physics and nursing, and has spent his career at the intersection of the body and science/technology. In the 1990s he published books on the medical Internet, and since then has been active in every aspect of electronic health records. For the past twenty years he has organized conferences, moderated listservs, and played a leading role in organizations in Integral Yoga. For the last three years he has published a blog on the boundaries of science as it relates to consciousness, with a particular interest in artificial intelligence.

children? Will they be as gods, and look back with fondness on their mortal ancestors of the 20th century?

“Two voices speak for the future, the voice of science and the voice of religion. Science and religion are two great human enterprises that endure through the centuries and link us with our descendants” (Dyson, 1998, pp. 6-7).

In my life I have sat around campfires, and dissected corpses; pored over Sanskrit verses, and visualized tesseracts; I have listened intently to the voices of science and the spirit. They both speak with authority, and both have a claim to describing reality. How can that be?

For several hundred years, religion and spirituality have railed against the notion of scientific reductionism, seeing it as a kind of blindness to a true understanding, and the depiction of the world as mechanical, inert, dead. William Blake wrote, “May God keep us from single vision & Newton’s sleep" (Blake, W., quoted in Damon, 1965). Science is rejected by theologians east and west as the great Satan.

A hundred years ago Sri Aurobindo described two negations. “Thought comes to deny the one [spirit] as an illusion of the imagination or the other [physical reality] as an illusion of the senses.” (Sri Aurobindo, 1972, p.7). He was addressing the problem of how the mind responds to two radically different experiences (physical sensation versus the inner spirit), and how a strong belief in one leads to an absolute denial of the other. It is more than a difference of opinion or culture. It is a complete denial of the one by the other. He wrote that at the dawn of relativity and quantum theory, but it is still valid. The paths of science and spirituality were never farther apart than they are today.

The divide between singularitarian technodreamers and spiritual savants is as wide as the universe. You will not find chanting or prayer at a transhumanist conference, nor will you find a demonstration of artificial intelligence at a spiritual gathering. They are members of separate clans who speak different languages. Chakras? fMRI? Reincarnation? Neural decoding? Even their gods require interpreters if they want to speak to each other. Language, books, computers and networks have each brought spectacular leaps forward in the development of consciousness.

But we stand on the edge of a shift that will dwarf all the preceding. Imagine: it is a few years in the future, and machine learners will be reading through millions of books and journals, billions of web pages, trillions of pieces of information, to save, categorize, parse, summarize, and synthesize. Then in the blink of an eye, a natural language interface will be marketed, allowing you to have a discussion with this worldwide exocortex, a brain outside your brain holding the world’s knowledge. A year later there is a brain-mind interface available that gives you instantaneous access to the world brain. And then you can talk to anyone, anywhere, through this medium, with the power of thought alone.

Through this series of inevitable, fantastically realistic, and fully practical steps we have entered a new world, where our understanding of knowledge, wisdom, education, and the very nature of humanity has shattered, and must be put back together again, like Humpty Dumpty.

It is premature to postulate a theory of everything, one that would link the arrows of Kurukshetra to the arrow of time, the eight siddhis to Hebbian synaptic learning. No person today has caught the formula that can simultaneously measure enlightenment and Kolmogorov complexity. We need a Turingesque Patanjali, an Einsteinian Aurobindo. Unexplored mountain ranges loom austere and white in the distance, harboring unmet and unimaginable civilizations.

Some believe that a single parsimonious equation holds the key, a lucky theory found in a dusty book or in the racetrack trails of bosons around a supercollider. They look with sinking hope to quantum mechanics, holography, zero-point energy, entanglement, or field theory. Despite long debates and enthusiastic conferences, however, none have explained mind or consciousness. Not really. They have not solved problems in cognition, generated testable and falsifiable hypotheses, created syntheses between existing accepted sciences, or opened new areas for investigation. What we have right now are philosophies, intriguing analogies, tantalizing hints, vague abstractions—not workable solutions.

Are we due for a Kuhnian revolution? Yes and no. Kuhn saw one half of the problem; his conceptual beast, hopping on one leg, can’t quite run the race. Science walks on two legs: theory *and* practice, idea *and* technology. The two are not separable. As Freeman Dyson (1999) notes, tools bring observation that stimulate new theories, and theories stimulate the development of new technologies, in an ever-increasing progression.

Humanists, priests, and hippies perennially wring their hands over the encroachment of the machine, and with good reason. The ugliness of concrete bunkers, the fumes of combustion engines, and the narrow lanes of rational argument have choked the human spirit. But we need to look beyond the past, zoom in with the eye of imagination and see what is happening: exponential change, driven by information technology. We are asleep at the wheel—governments, institutions, universities, humanity. “God will grow up while wise men talk and sleep” (Sri Aurobindo, 1972, p. 55). What will we do when our Lilliputian world is shaken by the first steps of this Titanic Being?

> Humans are not evolutionarily prepared for exponential change; it has rarely happened in the past, and has never been sustained as it is today. “It’s as if you kneel to plant the seed of a tree and it grows so fast that it swallows your whole town before you can even rise to your feet.” (Lanier, 2010, p. 8)

Or try taking a checkerboard, and put one grain of rice on the first square, two grains on the next, four on the next. Watch out: by the last square of the checkerboard, the final amount would be enough to cover India with a blanket of rice two meters deep. Exponential change is unthinkable for the human mind.

The word du jour to describe the point of explosion is singularity. The idea has caught fire among those who dream of radical technology—immortality, vast augmented intelligence, disembodied light-speed travel among the stars, the Last Generation, Humanity 2.0 playing at will with the structure of space and time.

A singularity in mathematics and physics represents a phase shift, a radical transformation, a boundary point where reality morphs beyond recognition. The phase shift that modern visionaries are speaking of is consciousness, though they use the word intelligence. John von Neumann used it first in this sense, saying that we are “approaching some essential singularity in the history of the race…” (quoted in Dyson, 2012, p.299). I.J. Good spoke of it in 1965 as an intelligence explosion, adding “the first ultraintelligent machine is the last invention that man need ever make” (Good, 1965, p. 3). In the 1980s Vernor Vinge established the word singularity as a technological tipping point.[2]

Slow down, says ‘the pessimist’. Humans occupy an insignificant corner of the cosmos; our frail and fugitive species has arisen in the last fraction of cosmic time. Not so, says Big History: the cosmos, life, and mind are a continuous, connected process. Each step tends toward greater complexity and consciousness.[3] In this cosmic view, science and technology are the growth tip that Gaia is using to feel her way into the future. Language, writing, books, science, computers, and networks form a progression through time; they are naturally artificial extensions of human consciousness. Each was a leap forward allowing the knowledge and ability of our species to extend beyond what a single person could understand, remember, or accomplish.[4]

In this idea of a continuous process linking the evolution of the cosmos, the emergence of life, the development of intelligence, and the emergence of science we can find a first hint of how science and spirituality may be integrated.

A snail, crawling on the Grand Canyon of geologic history, fails to feel the tectonic shift. Forty years ago a brain-computer device (cochlear implant) was considered science fiction, yet these implants are routine today.[5] Ten years ago nobody thought that a computer program could beat the world chess master. Five years ago the notion of working with single neurons through light (optogenetics) was unheard of. Three years ago the idea of telekinesis (moving matter by thought) was still a dream. A year ago recording inner consciousness, such as dreams, was unimaginable. Last year the notion that a computer could out-perform people in answering questions in natural language, over the entire realm of human knowledge, would have been laughed at. Yet all of these impossibilities have come to pass, and the trend is accelerating. This future isn’t what it used to be. Denial of scientific progress in the realm of mind and consciousness is like closing your eyes to avoid a lightning strike.

---

[2] The first description of this was “intelligence explosion” by the mathematician and cryptologist I.J. Good, in 1965. See “I.J. Good, "Speculations Concerning the First Ultraintelligent Machine", *Advances in Computers*, vol. 6, 1965. “Let an ultraintelligent machine be defined as a machine that can far surpass all the intellectual activities of any man however clever. Since the design of machines is one of these intellectual activities, an ultraintelligent machine could design even better machines; there would then unquestionably be an 'intelligence explosion,' and the intelligence of man would be left far behind. Thus the first ultraintelligent machine is the last invention that man need ever make.”

[3] See Fred Spier’s *The Structure of Big History*, or David Christian’s *Maps of Time*. Kevin Kelly also discusses this in *What Technology Wants*. “Big History studies the past across physics, astronomy, geology, biology, and human history. As it does so, it seeks common themes, paradigms, and methods…” (*Big History*, p. xxiv). The six epochs that Ray Kurzweil describes (physics, DNA, brain, technology, mind-machine interface, singularity) describe a similar continuity and progression.

[4] *Hamlet’s Blackberry* by William Powers (2010) describes these revolutions as technologies “of the mind,” and examines their potentially disruptive influence.

[5] After all, the auditory nerve has 16,000 channels, and at the time one or two channels were the only technology possible. See *World Wide Mind* (2011) by Michael Chorost.

If you want a glimpse of this future history, there is a borderland where science and consciousness meet, in the dead of night, glance at each other in passing, dimly recognize the other, and set up housekeeping. That borderland is science fiction, where telepathy and reincarnation, transcendence and uploading, biology and spirit come together to romp and beget strange offspring. Many a programmer is steeped in spiritual visions from science fiction literature, and many a meditator grew up on dreams of lasers, computers, and robots. Science and spirit may be segregated in the halls of Academe, but in the lands of literature and the imagination, they are producing chimera worthy of the 21st century.

If technology were to enable a leap in consciousness, it would precipitate a Cambrian explosion of creativity, development, and transformation. Why? Even in a mundane sense, consciousness is the force behind the major events in life and the world. Ants may build hills, but humans terraform the world.[6] Consciousness acting through human beings is the predominant force for better or worse on all life on the planet. Its development is more earthshaking than any other, including Darwinian evolution. In one possible future, humanity may evolve into something different, a transhuman and perhaps non-human species. Such a being will have a mind that is unknowable, beyond today’s conception. This is because that it will stand beyond today’s human.

Okay, let’s face it; it’s time to set down our prejudices, walk across the aisle, and shake hands.

Science and spirituality need to be brought together in practice. The theories and descriptions of the one must connect with and explain those of the other. Their phenomena must be related. Their tools and techniques must work together. There is no other future. Unfortunately, nobody even knows how to begin. Prayer and machine algorithms, incense and fMRI, meditation and brain-mind interfaces, the occult and optogenetics exist in two mutually-exclusive universes. The twains need to walk hand in hand, but they appear to walk right through each other, ghostly presences inhabiting different dimensions.

Science is rapidly moving into realms long thought to be the exclusive domain of the Romantic poet and the armchair psychoanalyst: dream, thought, awareness, meditation. Science is breaking down the barriers and letting light into rooms long locked with scriptural mantra and ecclesiastical legerdemain. The meeting of science and spirit is inevitable. Truth be told, they have been enmeshed in the mind for thousands of years, unbeknownst to all but the rare polymath. As soon as there were tools, they were used for spiritual practice as much as for tilling the earth or cooking food. Language, books, and the arts all use technology, understood in the wider sense, and the practice of spirituality has made these an essential part of its practice throughout history.[7]

The study of consciousness itself is fraught with disagreement—optimists expect a techno-rapture any day, pessimists deny that humanity will ever change. A vast muddled middle, go happily about their lives, unaware that the tsunami is racing for their cozy beach huts.

[6] For an ecstatic meditation on this idea, see the short video by Jason Silva: http://vimeo.com/29958619.

[7] Many modern writers (e.g. Kevin Kelly, David Deutsch, W. Brian Arthur, William Powers, and David Nye) see a linked series of successive technological “revolutions” starting with language and progressing up to current information technology.

Spirituality has ignored science, assuming that growth can only occur through the innate tools of consciousness itself: concentration, prayer, meditation, visualization. Even if we set aside a protected corner in the temple of mind for them, the future will not be limited to purely interior practices. In a few short years, less than a generation, it will include the rapidly advancing techniques of neurology, brain-machine interfaces, nanotechnology, algorithms, implants. Wild branches of the scientific vine are pushing into the temple, cracking the comfortable walls that have stood for millennia, bringing a paradoxically organic growth spurt. The resultant symbiosis of spirit and science will be stranger than technologists or mystics have imagined.

"We are creating a blueprint together—a design for our collective future. The possibilities for… spiritual progress are tremendous" (Rushkoff, 2011, p.8). Spirituality is facing its most important challenge in history. Will we be able to detect and measure spiritual consciousness? Will an artificial entity supersede humanity? Will thought projection or telepathy become routine? Will human beings augment their mind/brain, producing radically new kinds of awareness? Will the spirit itself change?

Change is upon us. A new normal is chipping through its egg, and looking around in wonder. How will coming generations integrate this with their understanding of intelligence, consciousness, and the human being? What is needed is a synthesis of neurology, information science, artificial intelligence, and spirituality. I believe it will happen; it must happen. It will be unprecedented, extraordinary, beautiful, and frightening. New entities will walk into our dreams and visions, and our lives.

Sri Aurobindo's Lila
The Nature of Divine Play According to Integral Advaita

Matthew W. Morey[1]

Abstract: This essay addresses the concept of Lila, or Divine Play, in the context of Integral advaita as described by Sri Aurobindo and Haridas Chaudhuri. In order to convey the characteristics of Integral Lila, the first part of the essay examines Integral Advaita. The second part of the essay directly addresses Sri Aurobindo's description of Lila, a play that is at once a dalliance of the Divine and a teleological drama unfolding toward a denouement that may be at hand. In the context of Lila, the essay examines evolution, the individual poise of Brahman and the participatory nature of Integral Yoga.

Keywords: Haridas Chaudhuri; Integral Non-dualism; Integral Philosophy; Integral Yoga; Integral Advaita; Sri Aurobindo; Lila; *Purnadvaita*.

> *The slow self-manifesting birth of God in Matter is the purpose of the terrestrial Lila.*
> (Ghose, 1997, Vol. 12, p. 247)

Lila, as a concept denoting play, is applied to much of Indian thought, both spiritual and secular. According to Apte's *Practical Sanskrit-English Dictionary*, the noun *lila* means anything from "Sport, dalliance, play" to "any languid or amorous gesture in a woman" (Apte, 1965, p.813). Clearly not reserved strictly for the spiritual, lila is nevertheless employed as a justification for the mystery of existence in various Indian religions. Depending on the spiritual system claiming the term, lila denotes a specific Divine play whose nature corresponds to the fundamental epistemological and spiritual beliefs of the tradition in question. Thus the tenor of the definition of lila provides a unique vantage point for any spiritual tradition that utilizes the term.

In this essay I will examine the concept of *Lila*[2] in the context of Sri Aurobindo's Integral yoga. The essay is divided into two sections: The first examines the distinguishing characteristics

of *purnadvaita* (integral nondualism) in the context of Integral yoga. In this section I use primarily the material from Haridas Chaudhuri who has produced numerous studies examining and comparing Sri Aurobindo's Integral advaita, a complex and nuanced distinct interpretation of nonduality, with other religious schools. His studies have distilled out the major characteristics of Integral advaita that will be used in the remainder of the paper. These characteristics, which will be examined thoroughly in the section on purnadvaita, include the following: validity of three quasi-independent poises of being within the larger framework of Brahman[3]; the evolution of consciousness from the nescient world of matter toward superconscious beings who will evolve past a sense of separation from, and ignorance of Brahman; and the participatory role of human beings in this unfolding evolution.

The distinguishing properties of Sri Aurobindo's Integral advaita provide the philosophical and spiritual framework in which Lila is embedded. The second section examines the concept of *Lila* as referenced in the works of Sri Aurobindo, focusing primarily on passages form *The Life Divine*, and the implications of this interpretation of Lila.

Lila in Integral yoga is indeed the idle play of the Absolute, but the play involves a uniquely teleological and participatory agenda—an agenda that the Absolute has somehow put forward—that leads toward the evolution of consciousness. The three poises of being provide a context for this evolutionary agenda. The participatory nature of the individual poise of being creates a quasi-independent dynamo for the evolution of consciousness. But this evolution is conceived "in sport" (Ghose, 2009, Vol.2, p.611) in that its denouement, the recognition of Brahman in all things, has never been absent; or as Chaudhuri describes it, liberation or "*mukti* [is the] realization of eternal identity with the Divine" (Chaudhuri, 1950, p.221). Thus the Lila of Integral advaita is a specific play at once teleological and idle, and one in which humans are definite distinct players with unique agency to further Brahman's game.

Advaita in the Context of Integral Philosophy

Haridas Chaudhuri explores Integral Advaita from several perspectives. In *Being, Evolution & Immortality* (Chaudhuri, 1974) and in the essay, *The Integral Philosophy of Sri Aurobindo* (Chaudhuri, 1960), he compares eastern nondual practices with western dualistic ones, examines the various ways in which nondual Advaita Vedanta traditions have manifested in Asia and distinguishes Integral advaita from the other nondual traditions. Chaudhuri takes on a perennialist perspective with regard to advaita, suggesting that the traditions that emphasize the nondual realization include, among others, "Vedanta, Tantra, Vaisnavism, Taoism, and Zen," and he suggests Christian mysticism and Sufism also have qualities of nondual traditions (Chaudhuri, 1960, p.26). He speaks to the wisdom of these philosophies, discussing their strengths and shortcomings. Though each has its own wisdom and practices that emphasize the ever-available access to the lived experience of the Absolute, Chaudhuri contends that none of these schools embraces the whole of human experience.

---

[3] In this paper the use of the word Brahman is synonymous with the Absolute, the Infinite, God and Being. Though at certain points Ishwara, Purusha and other terms might be more specifically appropriate, this level of parsing the nature of existence is beyond the scope of this essay. The chapter "Brahman, Purusha, Ishwara—Maya, Prakriti, Shakti" in *The Life Divine* (Ghose, 2009, Vols. 21-22, pp. 336-379) distinguishes the nuances of these different expressions of Being. Brahman contains them all: "Brahman the Reality is Atman, Purusha, Ishwara….The Supreme Brahman is that which in Western metaphysics is called the Absolute: but Brahman is at the same time the omnipresent Reality in which all that is relative exists as its forms or its movements…" (p. 338).

According to Chaudhuri, only Sri Aurobindo integrated the strengths and wisdom of these various religious traditions to create a *purnadvaitavada*, or Integral Advaita. Chaudhuri (1950) clarifies the inclusiveness of Integral advaita in *Sri Aurobindo: Prophet of the Life Divine*[4], identifying the distinctions between Integral nondualism and *kevaladvaitavada* (unqualified nondualism), *visistadvaitavada* (qualified nondualism) and *dvaitavada* (dualism). He discusses how each of these three spiritual schools have a legitimate contribution to make, but none of them alone can be said to honor the full range of the existence: the co-existence of the individual along with the cosmic contexts and the transcendent Sachchidananda. Any of these three schools of Eastern thought touch on an abiding truth of existence, but only Integral advaita finds an integral poise including the three into a larger whole.

The key to Chaudhuri's analysis is the observation that the absolute can have paradoxical manifold simultaneous expressions without diminishment. Brahman can divide itself into individual beings with agency and self determination, while expressing the unfolding cosmic designs as well as the inescapable ultimate transcendent Sachchidananda.

> [I]ntegral nondualism affirms being as the undivided unity of the formless and multiple forms. According to ancient nondualism, ultimate reality is the formless, the indeterminable. Forms and determinations are unreal from the ultimate standpoint. In the view of Integral nondualism, forms and determinations also are very real from the ultimate standpoint. They are the glory of the creative urge inherent in Being. They provide meaning and reality to the self-expressive impulse of Being. (Chaudhuri, 1974, p. 31)

This affirmation of formlessness and form sets the stage for an exploration of distinct poises of being that exist inseparably within the cognitively incomprehensible seamlessness of Brahman. "As supra cosmic transcendence, Brahman is not a blank featureless unity, but an infinitely opulent unity embracing an unlimited wealth of content and measureless possibility" (Chaudhuri, 1950, p.218). Chaudhuri suggests that no previous religious tradition has effectively integrated the truths in the various nondual and dual wisdom traditions in Asia. Exploring *kevaladvaitavada*, *visistadvaitavada* and *dvaitavada*, he details both the accuracy and the limitations of these schools of thought, and sets up an interpretation of Integral advaita that includes the wisdom of each.

With regard to unqualified nondualism, whether that of Shankaracharya's advaita, Buddhism, Samkhya yoga, or other traditions, Chaudhuri has a mixed review. These wisdom traditions have brought to consciousness the capacity to experience the ineffable unity of being at the very heart of the mystery of existence, which has of course been a gift to humanity. But two shortcomings exist about their interpretations of the range of existence. First, the emphasis on the transcendent has uniformly minimized the immanent expression in this world. Involvement in this world is, according to these advaita schools, a potential "entanglement either in the meshes of Prakriti

---

[4] Much of the material Chaudhuri uses can be found in *The Life Divine* in the chapter "The Triple Status of the Supermind" (Ghose, 2009, Vols. 21-22, pp. 152-160). Chaudhuri's work is both an exegesis of this chapter and a comparative analysis with other religious traditions in India.

(Samkhya) or in the cobwebs of Maya *(Shankara Vedanta*), or in the fetters of Karma *(Buddhism*)" (Chaudhuri, 1950, pp. 44-45). The shortcoming in this perception of the manifest world is the conviction that involvement in this world of nature and people is entangling illusion fraught with dangerous spiritual setbacks.

Integral advaita emphasizes that depths of sustained liberation should include the embodiment of the individual in the realm of this cosmic expression of Brahman; the world is nothing other than Brahman's creative expression and the liberated individual is the fruition of Brahman rising to consciousness in Jivatman. As Chaudhuri (1950) describes,

> The empirical individual is without a doubt a product of Ignorance, but the same cannot be said of the spiritual *individual* (*jivatman*) which is essentially a particular poise of being or mode of manifestation of the supreme Spirit. Identical with Brahman in essence and existence, the spiritual individual has also a unique function and form of manifestation of its own, in consequence of which it differs from other poises of being of Brahman, the supreme Reality. (p. 216)

From this point of view the world itself—again provided that the individual has been liberated from "all taint of ignorance" that keeps the ego in a state of illusion of separation and self importance—is an inseparable expression of Brahman, valid in its own right and, as a creative manifestation of Brahman, worthy of creative interface and participation by the individual.

Qualified nondualism or *visistadvaita*, according to Chaudhuri, makes the contribution to the dialogue of religious wisdom that *jivatman*, the spiritual self of each individual, is in fact an inseparable aspect of Brahman. *Jivatman* "is not ontologically separate form the supreme Lord, but is rather eternally dependent upon Him as His standing self-differentiation" (Chaudhuri, 1950, p.213). However, the insufficiency of the qualified schools of Advaita, according to Chaudhuri, is that their understanding of the nature of existence fails to capture the nature of relationship of the Jivatman and Brahman.

No analogy or conceptual framework can do justice to the mysterious nature of Being. The term *self-differentiation* from the passage above speaks to the wisdom of both unqualified advaita and qualified advaita: This is all Brahman, all without the possibility of otherness. But paradoxically—and as the qualified advaitans emphasize—the human aspect of Brahman does in fact have a quality of independence within the larger frame of being Brahman.

Chaudhuri (1950) suggests that humanity is an aspect of Brahman, but with a standing independent agency. This paradox is of course at the heart of liberating insight. "The Individual Self is not a mere power or form or quality or function of the Absolute; it is the Absolute itself in a particular poise of being" (p.213). The shortcoming of the Qualified Nondualism is summed up as a sort of inverse to the Unqualified Nondualism:

> In other words, *visistadvaita* is mistaken in emphasizing the Saguna aspect of Brahman at the cost of the Nirguna aspect. Brahman is at once Nirguna and Saguna. And the liberated soul is at liberty to choose either the state of blissful absorption in Nirguna Brahman or the state of rapturous communion with the Saguna Brahman (p. 214).

Here the Nirguna aspect of Brahman is the transcendent state of the movement beyond form. The Saguna aspect is the world of form that is a poise subsumed in the formless unfolding. Both poises, Chaudhuri suggests, are valid.

Dualism, or *dvaitavada*, validates the abiding quality of the spiritual individual before, during and after spiritual awakening. What liberation eradicates is the ego, the "empirical self which is an organization of Nature (*prakriti*) for the centralization of man's manifold experience" (Chaudhuri, 1950, p.212). The spiritual self is in fact "an eternally real component of ultimate reality"(p.212). However, Dualism overshoots the mark when it perceives each Jivatman is ontologically independent from one another and the larger scope of Ultimate existence. Dualism as a system of thought acknowledges the individualization of Brahman into component parts "*as if* it were entirely separate from other individual soul forms and also form the universal Divine" (pp.210-211). This "poise of being in the Spirit" is critical to Integral nondualism, but it must be taken within the larger truth of Being: "The basic and essential unity of Spirit is in no way abrogated by this free play of differentiation" (p. 211).

Integral advaita reconciles the validity of all three of these spiritual schools.

> When the Spirit is realized in its full Integrality, it is found that advaita, visistadvaita, and dvaita are all true, although none of them represents the whole truth. They are all true in so far as they endeavor to translate in terms of logical thinking three equally real poises of being—three supramental forms of self-manifestation—of the same indivisible ineffable Spirit. (Chaudhuri, 1950, p. 211-212)

Thus each is valid, but not sufficient to embrace the range of being that is described by Integral advaita. Below is an extended passage from *The Life Divine* (Ghose, 2009, Vols. 21-22) in which Sri Aurobindo describes the coexistence of three poises of being, all of which, he proposes, can be grasped by the Supermind:

> We, human beings, are phenomenally a particular form of consciousness, subject to Time and Space, and can only be, in our surface consciousness which is all we know of ourselves, one thing at a time, one formation, one poise of being, one aggregate of experience; and that one thing is for us the truth of ourselves which we acknowledge; all the rest is either not true or no longer true…. But the Divine Consciousness is not so particularized, nor so limited; it can be many things at a time and take more than one enduring poise even for all time. We find that in the principle of Supermind itself it has three such general poises or sessions of its world-founding consciousness. The first founds the inalienable unity of things, the second modifies that unity so as to support the manifestation of the Many in One and One in Many; the third further modifies it so as to support the evolution of a diversified individuality which, by the action of Ignorance, becomes in us at a lower level the illusion of the separate ego. (pp. 155-156)

This passage speaks to the limitations of the human mind such that we embrace a single poise of being that is true and limit that observation as the exclusive truth. Thus *advaita*, *visistadvaita* and *dvaita* all have truths to offer humanity, but none are sufficient to describe the paradoxical inclusive expression of Brahman. The three poises described in the above passage correspond to the wisdom of the three spiritual schools that Chaudhuri analyzes above. The Unqualified Nondualists describe the "inalienable unity of things"; the Qualified Nondualists adhere to the "manifestation of the many in the one"; and the Dualists affirm "the evolution of a diversified individuality." The coexistence of the three poises of Being is beyond the scope of our conceptual analysis of the regular human mind, but the profound expression of the three can be simultaneously experienced by the Supermind, toward which Sri Aurobindo suggests consciousness, in the guise of humanity for the time being, is evolving. Chaudhuri (1950) captures the inclusive and indefinable nature of the coexistence of the three poises of being within Integral Nondualism:

> The spiritual individual is, in point of truth, a center of universal consciousness, a focus and medium of the transcendent Divine. Eternally free in itself, the spiritual Individual is essentially identical with the All of existence and also identical with the all-transcending One. That is why *purnadvaitavada* maintains that supra-cosmic transcendence, cosmic universality and unique individuality are three equally real, non-temporal poises of being of the same supreme Spirit. (p. 220)

Lila

> *All exists here, no doubt, for the delight of existence, all is a game or Lila; but a game too carries within itself an object to be accomplished and without the fulfillment of that object would have no completeness of significance.*
>
> (Ghose, 2009, Vol.2, p.867)

Sri Aurobindo's Commentary on Other Spiritual Views of Lila

To understand the unique manner in which Sri Aurobindo applies *Lila* to Integral Yoga requires that we first explore what he asserts Integral Lila is not. In his chapter, "The Divine and the UnDivine" (Ghose, 2009, Vols. 21-22, pp. 403-427), Sri Aurobindo describes possible variations on a doctrine of Lila that other religions and advaitin points of view might advocate. First with regard to dualistic thinking, whether some schools of Sankhya and Vaishnavism or certain Christian interpretations, Sri Aurobindo distinguishes his interpretation of Divine play from theirs. According to the dualistic schools, this worldly life is often seen as unDivine.

> The soul by taking on manhood, perhaps by the very fact of birth itself, has fallen from the Divine, has committed an original sin or error which it must be man's spiritual aim, as soon as he is enlightened, thoroughly to cancel, unflinchingly to eliminate. In that case, the only reasonable explanation of such a paradoxical manifestation or creation is that it is a cosmic game, a Lila, a play, an amusement of the Divine Being. (Ghose, 2009, Vols. 21-22, p. 424)

Birth as an original sin or error clearly does not fit into the Aurobindonian understanding of Integral advaita. This understanding might be seen as teleological, but with these dualistic schools the teleology is promoted in the sense of eradicating a mistake. Sri Aurobindo's teleological play, which will be further examined below, does not start with a separation from or mistake of the Divine. Clearly, *Lila* of the dualistic schools could be employed to their explanations of the mystery of existence, only the play involves a very different paradigm.

Sri Aurobindo (Ghose, 2009, Vols. 21-22) goes on:

> Or, perhaps, as some religions curiously suppose, He has done this so that there may be inferior creatures who will praise and glorify Him for his eternal goodness, wisdom, bliss and omnipotence and try feebly to come an inch nearer to the goodness in order to share the bliss, on pain of punishment—by some supposed eternal—if, as the vast majority must by their very imperfection, they fail in their endeavor. But to the doctrine of such a Lila so crudely stated there is always possible the retort that a God, himself all-blissful, who delights in the suffering of creatures or imposes such suffering on them for the faults of his own imperfect creation, would be no Divinity and against Him the moral being and intelligence of humanity must revolt or deny His existence. (p. 424)

This dualistic rendering of a narcissistic God not only misses the mark of Lila in the Integral sense, but would demand a sort of spiritual call to arms by Sri Aurobindo, were it to be the case.

The applications of the term *Lila* to various other nondual schools of thoughts are dealt with subtly. With traditional Advaita in the Shankaracharya tradition in question, the obvious question of what is the motivation for this mask of imperfection on the ultimate transcendent Brahman that underlies all of our experience of existence?

> It may be He pretends to be unDivine, wears that appearance like the mask or make-up of an actor for the sole pleasure of the pretence or the drama. Or else He has created the unDivine, created ignorance, sin and suffering just for the joy of a manifold creation. (Ghose, 2009, Vols. 21-22, p.424)

Perhaps for the advaitin sages that have experienced the Absolute, an explanation of any kind seems unnecessary. To transcend this realm of earthly experience and to see the vaster beautiful truth that embraces all possible manifestations is enough. Many advaitins may feel that the realm of seeking a logical explanation of any kind is to reenter into the small provincial world of our human drama. Since many nondual teachers do describe the typical human experience as an illusion, far removed from the liberating insight of true revelatory experience, engaging the mind to begin to fathom the mystery of Brahman's purposes may seem not just idle, but counter to the experience of insight into the absolute, often described as sheer wisdom, love or bliss.

Sri Aurobindo offers—and then refutes—two possible traditional nondual explanations of the mysterious puzzle of our existence within Brahman.

He suggests that the human drama with its shrouded comprehension of the Absolute is, a) an aspect of Brahman that He created of Himself as an idle pleasure of enactment or; b) simply the experience of the joy of being variously manifested. These two explanations affirm the status quo. One might argue that if bliss simply exists as the backdrop to all this creation, there is no need to meddle with complex thoughts of Brahman's intention. The fundamental knowledge that Atman is Brahman is enough to trust in the Divine and let the unfolding creation take care of itself. The direct experience of Brahman, beyond the grasp of most of humanity, is sufficient. To fathom the intention of Brahman is unnecessary and quite possibly counterproductive to that direct experience.

Sri Aurobindo, however, does not adhere to this relationship between Atman and Brahman. He sees submission to an arbitrary universe with odd-ball beings, a few of whom can glimpse the Divine, as unbecoming to an all-blissful Brahman. Why should the vast majority of beings be destined to live in an ill-suited illusion while in actuality embraced by an abiding Love? With God of creation in all things, would this perspective not be a dim view of his purposes?

> [E]xistence of the individual is not an error in some self of the Absolute which that self afterwards discovers… Neither is the individual existence a subordinate circumstance in a Divine play or Lila, a play which consists of a continual revolution through unending cycles of pleasure and suffering without any higher hope in the Lila itself or any issue from it except the occasional escape of few from time to time out of their bondage to this ignorance. We might be compelled to hold that ruthless and disastrous view of God's workings if man had no power of self transcendence or no power of transforming by self-knowledge the conditions of the play nearer and nearer to the truth of the Divine Delight. (Ghose, 2009, Vols. 21-22, p. 402)

Sri Aurobindo clearly does not adhere to a view of Lila that would affirm the idle cycle of things. The view of a God that would provide for such a turn of affairs in which the mass of beings suffer in a small realm of being while only a very few beings perceive the delight that is Brahman, Sri Aurobindo offers as "ruthless and disastrous." Further, in emphasizing humanity's agency in bringing about self transcendence, Sri Aurobindo suggests that submitting to a worldview that holds with things as they are would indicate that we are missing the value of the very gift we have been given in this human form. He suggests here that we can and should engage in our own transformation.

Lila in the Integral Yoga Perspective

> *[E]ternal and immutable delight of being moving out into infinite and variable delight of becoming is the root of the whole matter…* (Ghose, 2009, Vols. 21-22, p. 111)

As described in the section above, Integral advaita distinguishes three poises of being: transcendental, universal and individual. These three poises exist distinctly within Brahman because Brahman can be paradoxically manifold and beyond manifold without ever losing its Absolute nature as Being. Transcendent Sachchidananda, the laws and expression of the material cosmos and the dawning consciousness of individual beings coexist. Each is a realm valid in and of itself, and each is an aspect of the play of the Absolute Brahman.

> As with the being of Brahman, so with its consciousness, Maya: it is not bound to a finite restriction of itself or to one or law of its action; it can be many things simultaneously, have many co-ordinated movements which to the finite reason may seem contradictory; it is one but innumerably manifold, infinitely plastic, inexhaustibly adaptable. Maya is the supreme and universal consciousness and force of the Eternal and Infinite and, being by its

> very nature unbound and illimitable, it can put forth many states of consciousness at a time, many dispositions of its Force, without ceasing to be the same consciousness-force for ever. It is at once transcendental, universal and individual; it is the supreme supracosmic Being that is aware of itself as All-Being, as the Cosmic Self, as the Consciousness-force of cosmic Nature, and at the same time experiences itself as the individual being and consciousness in all existences. (Ghose, 2009, Vols. 21-22, p. 356)

In order to comprehend *Lila* in the context of Sri Aurobindo's Integral yoga, this point, clearly identified by Sri Aurobindo above, must be understood. A nondual expression can manifest variously, obviously. That is the significance of nonduality: no individual being or object exists outside the creative expression of Brahman. All is Brahman unfolding. But the distinction that Sri Aurobindo makes above is that multifarious poises of being are expressing independently within the larger frame of Brahman. The transcendent, the cosmic and the individual exist on relatively independent levels of existence. Granted a rough conceptual sketch would put the individual consciousness within the cosmic, which in turn exists within the transcendent. But each has an independent expression simultaneously. This distinction of being, examined thoroughly by Chaudhuri (1950), as described above, begins to elucidate the nature of Being within which the Divine Lila of Integral yoga unfolds.

Evolution

The question of why such a complex system of Being exists as the expression of perfect Brahman is addressed repeatedly by Sri Aurobindo. Why, if cosmic material of all nature and life forms of all manner are perfection unfolding, is this delight of Being so hidden from consciousness in this worldly poise? Why do the vast majority of life forms on earth, including humans, in spite of their Divine status, fail to identify themselves as such? Our vision of our divinity is imperfect. If Sri Aurobindo's observations are correct, in spite of our Divine essence, most humans do not perceive this true nature. Is this some sort of deluding ruse that Brahman is playing on aspects of Itself?

Sri Aurobindo's response to these questions is simple: the Lila of Brahman involves the evolution of consciousness toward Sachchidananda.

> In that power [of human capacity of self transcendence] lies the justification of individual existence; the individual and the universal unfolding in themselves the Divine light, power, joy of transcendent Sachchidananda always manifest above them, always secret behind their surface appearances, this is the secret intention, the ultimate significance of the Divine play, the Lila. But it is in themselves, in their transformation but also their persistence and perfect relations, not in their self-annihilation that that must be unfolded. Otherwise there would be no reason for their ever having existed; the possibility of the Divine's unfolding in the individual is the secret of the enigma, his presence there and this intention of the self-unfolding the key to the world of the Knowledge-Ignorance. (Ghose, 2009, Vols. 21-22, p. 402)

Thus the "secret intention" of the Lila is the "transformation" from unconscious matter to conscious beings to individuals in the cosmos who recognize their place in the Divine and the

Sachchidananda that permeates life and existence with that level of awakening. The "self-annihilation" of the schools of Advaita that promote transcendence from this realm of matter and individual consciousness does not agree with the transformation that Sri Aurobindo proposes. The material world and the beings whose consciousness has arisen thereof, are valid expressions per se of this creative unfolding mystery. To emphasize the primacy of transcendence from this world of form and individual life denigrates the miracle of our existence as evolving expressions of Brahman in this realm of cosmic and individual existence. Lila, from the Integral perspective, validates the Maya of this realm, its expression and development, as fundamentally valid expressions of Brahman in the context of the mystery of the play.

However, for Sri Aurobindo the creative and teleological play of Lila is superior to the concept of Maya. In comparing the Integral perspective, which embraces both the transcendent and the material poises, to the advaita of Shakaracharya, which gives primacy to the transcendent poise Being, Sri Aurobindo remarks:

> The world, as God has made it, is not a rigid exercise in logic but, like a strain of music, an infinite harmony of many diversities, and his own existence, being free and absolute, cannot be logically defined….Maya is one realisation, an important one which Shankara overstressed because it was most vivid to his own experience. For yourself leave the word for subordinate use and fix rather on the idea of Lila, a deeper and more penetrating word than Maya. Lila includes the idea of Maya and exceeds it. (Ghose, 2009, Vol. 13, p. 89)

Maya, often translated to English as illusion, indicating the illusion of manifest existence, is understood by Sri Aurobindo differently. He describes Maya as the "consciousness" of Brahman (Ghose, 2009, Vols. 21-22, p.356). This definition of Maya gives it substantially more credibility than regarding it as illusion. If this elevation of Maya is taken as a premise, "then certain consequences inevitably impose themselves" (Ghose, 2009, Vols. 21-22, p.112). These include, first, that we are unknowingly supported by Brahman in this Lila in all moments and realms of being, and, second, that we are only partially evolved toward the desired ends of this Lila.

Lila, the play of affairs of the Divine, involves the transformation of Maya toward the realization of its true nature. In Moksha, the liberated mystics have achieved a level of consciousness that is essentially the Maya of manifest existence perceiving its place as Brahman. The possibility for humanity to rise above the station that it currently holds, that of illusion of separation and suffering, even as it is already one with Brahman, offers a glimpse of evolution and the manifold nature of Being.

> In the first place…since in the reality of our being we are the indivisible All-Consciousness and therefore the inalienable All-Bliss, the disposition of our sensational experience in the three vibrations of pain, pleasure and indifference can only be a superficial arrangement created by that limited part of ourselves which is uppermost in our waking consciousness. Behind there must be something in us—much vaster, profounder, truer than the superficial consciousness—which takes delight impartially in all experiences; it is that delight which secretly supports the superficial mental being and enables it to persevere through all labours, sufferings and ordeals in the agitated movement of the Becoming…. Oneness finds itself infinitely in what seems to us to be a falling away

> from its oneness, but is really an inexhaustible diverse display of unity. This is the miracle, the Maya of the universe, yet perfectly logical, natural and a matter of course to the self-vision and self-experience of the Infinite. (Ghose, 2009, Vols. 21-22, p. 112)

There is no way for us to be anything other than perfect transcendent Being unfolding, yet there is this illusion of separateness. In the larger frame of Being, regardless of our pains, some part of us "takes delight impartially in all experiences." The illusion of separateness and the pains that result are indications of our imperfect evolution toward Sachchidananda. Our divided consciousness is:

> … an imperfect response, a tangled and discordant rhythm preparing and preluding the full and unified play of the conscious Being in us; it is not the true and perfect symphony that may be ours if we can once enter into sympathy with the One in all variations and attune ourselves to the absolute and universal diapason. (Ghose, 2009, Vols. 21-22, p. 112)

This imperfection of human experience is logical from the point of view of the graduated development from nescient matter toward individuals whose consciousness can realize the Sachchidananda that permeates all things. Imperfection is necessary in the movement from inert matter to life to embodied aspects of Brahman experiencing Itself—all of which is part of Brahman's Lila.

> The strangeness of the play diminishes, the paradox loses its edge of sharpness if we discover that, although fixed grades exist each with its appropriate order of nature, they are only firm steps for a progressive ascent of the souls embodied in forms of matter, a progressive Divine manifestation which rises from the inconscient to the superconscient or all-conscient status with the human consciousness as its decisive point of transition. Imperfection becomes then a necessary term of the manifestation: for, since all the Divine nature is concealed but present in the Inconscient, it must be gradually delivered out of it; this graduation necessitates a partial unfolding, and this partial character or incompleteness of the unfolding necessitates imperfection. An evolutionary manifestation demands a mid-stage with gradations above and under it,—precisely such a stage as the mental consciousness of man, part knowledge, part ignorance, a middle power of being still leaning on the Inconscient but slowly rising towards the all-conscious Divine Nature. (Ghose, 2009, Vols. 21-22, p. 425)

This passage describes both evolution, the firm steps for a progressive ascent of the souls embodied in forms of matter, and the position of humanity in this ascent, a "mid-stage" of evolution, part insight, part ignorance. The description of evolution as 'progressive Divine manifestation which rises from the inconscient to the superconscient or all-conscient status with the human consciousness as its decisive point of transition' is both indicative of the evolutionary movement of Maya and the important position that humanity holds in this game of the Divine. Humanity is on the verge of achieving the critical evolutionary step of consciousness toward individual Beings who can achieve and sustain their relation as Brahman in this individual poise in the world of the cosmos: matter, soul, and even community. Sri Aurobindo's Integral yoga proposes that humanity can rise out of its stupor and ignorance, and that each individual should employ the agency to rise up toward the Divine. Lastly, this passage reminds us that the Divine is always in the background, holding and sustaining human beings even when enveloped in the fog of their illusions of separateness: 'since all the Divine nature is concealed but present in the Inconscient, it must be gradually delivered out of it'. The nature of evolution is paradoxical: Humans are unconscious players in a game they have already won. The key to the game is that they must discover this for themselves.

This evolution from a limited largely unpleasant perception of ourselves to the Being-Consciousness-Bliss of Sachchidananda raises the question of cruelty: Why is humanity seemingly unwittingly involved in a game, much of which involves suffering. This game—whose dénouement, which exists just beyond the grasp of the ego for most of us, is incomparable joy—may seem rather tragic to the observer on the sideline: so much suffering to the multitudes of individuals. Why would the Absolute create players ignorant of their role in the game? Sri Aurobindo holds that an aspect of Atman must have consented to this play of the Divine:

> A manifestation of this kind, self-creation or Lila, would not seem justifiable if it were imposed on the unwilling creature; but it will be evident that the assent of the embodied spirit must be there already, for Prakriti cannot act without the assent of the Purusha. There must have been not only the will of the Divine Purusha to make the cosmic creation possible, but the assent of the individual Purusha to make the individual manifestation possible. (Ghose, 2009, Vols. 21-22, p. 426)

Prakriti, in broad terms, refers to the earthly realm of material world and egoic beings that seem, phenomenologically, separate from Brahman. Purusha is the transcendent aspect of Brahman and Atman. That 'Prakriti cannot act without the assent of the Purusha', whether cosmic or individual suggests that the Divine cannot make players completely ignorant of their status as Divine. There is consent of some sort in this realm of Purusha that renders the illusion of suffering separate individuals moot. There is never complete severance from the Divine; our individual Atman is always there just behind the curtain of ignorance.

> But if the human soul is a portion of the Divinity, if it is a Divine Spirit in man that puts on this imperfection and in the form of humanity consents to bear this suffering, or if the soul in humanity is meant to be drawn to the Divine Spirit and is His associate in the play of imperfection here, in the delight of perfect being otherwhere, the Lila may still remain a paradox, but it ceases to be a cruel or revolting paradox; it can at most be regarded as a strange mystery and to the reason inexplicable. (Ghose, 2009, Vol. 21-22, pp. 424-425)

We are each, then, the Divine Spirit's "associate." A part of us colludes with the Divine to play this game of imperfection. This image of individual Purusha admitting us into this game of evolution seems to render the game an odd curiosity, 'a strange mystery and to the reason inexplicable'.

Sri Aurobindo, however, proposes several nuanced justifications for the initiation of this Lila. First and foremost, Sri Aurobindo affirms the mystery of this game. He addresses the question of why we have this game to re-evolve into Brahman, when one has from the start never been separate: "The only question is the reason why this kind of progressive manifestation was itself necessary; that is the sole point left obscure to the intelligence" (Ghose, 2009, Vols. 21-22, p.

426). He offers that the movement is itself a mystery beyond our ken: But it may be said that the Divine Will and delight in such am arduous manifestation and the reason for the soul's assent to it is still a mystery. But he goes on to say that a play of self-concealing and self-revealing is one of the most strenuous joys that a conscious being can experience. More than a mere game of transcendental hide and seek, this play involves the most poignant aspects of being alive. This then, the expression of Brahman in myriad individual forms whose accomplishment is discovering their innate divinity from the shroud of ignorance, might be one reason for this Divine game, the delight of self discovery.

Another sort of proposed justification for the play of the Divine that Sri Aurobindo suggests "is a new affirmation of Sachchidananda in its apparent opposite. If the Infinite's right of various self-manifestation is granted, this too as a possibility of its manifestation is intelligible and has its profound significance" (Ghose, 2009, Vols. 21-22, p. 427). What sort of seamless bliss existed before the poise of cosmos began is, of course, unknowable. But the choice to take this "plunge into Inconscience," (p. 427) to take form in matter and cosmic energy, perhaps was preceded by simple uncomplicated bliss of Brahman. This plunge into the material world followed by a gradual evolutionary uncovering of the divinity innate in all things, then, could be for a freshness of perspective and affirmation of itself from the depths of the inert conditions of cosmic existence.

Whatever the motivation for the source of this teleological Lila may be, Sri Aurobindo is clear that there exists an abiding Sachchidananda at every level of the game. The game's sought resolution, that of abiding creative Being-Consciousness-Bliss, has never been absent, even as evolution of consciousness brings humanity closer to Sachchidananda. Perhaps the motivation for initiating the play is too vast for our psyches to grasp. Sri Aurobindo realized levels of communion with Brahman that unveiled the Being-Consciousness-Bliss, steadily present and gracious, unfailingly behind and within the movement of all things.

> The world of which we are a part is in its most obvious view a movement of Force; but that Force, when we penetrate its appearances, proves to be a constant and yet always mutable rhythm of creative consciousness casting up, projecting in itself phenomenal truths of its own infinite and eternal being; and this rhythm is in its essence, cause and purpose a play of the infinite delight of being ever busy with its own innumerable self-representations. (Ghose, 2009, Vols. 21-22, p. 111)

Thus Lila, idle Divine play, is the most fundamental motivation for existence as it stands.

The Participatory Nature of Evolution

The individual poise of Integral advaita describes beings within the cosmic design of Brahman, mainly ignorant of their Divine status for the time-being, that have agency to further their own evolution. That Brahman should willingly divide itself into micro-beings, fragments of Itself, who don't know what they are, may seem rather arbitrary. This arrangement certainly seems capricious.

However, the cosmic design has given us autonomy to move and develop as we will; hence, we participate in the Lila of immanent consciousness evolving toward Divinity. The aspect of evolution that is participatory for humanity involves choice: to submit to complacency or to live in such a way that moves us toward experiencing the Divine in any given moment. Our position as humans allows us the opportunity to consciously move our souls toward the union with Divine, even as we stay in and engage with the manifest material world. Alternatively, we also can choose to live in the 'sensational experience in the three vibrations of pain, pleasure and indifference'. This latter choice is, of course, compelling to most of us.

This complex evolution is at the heart of Integral advaita and Integral Lila. Brahman has moved into the inconscience of the cosmos for some reason beyond comprehension. But the movement is clearly toward reawakening to our true nature, otherwise why stars? Why planets? Why water? Why life? Why liberation (Moksha)? Humans can choose to fully engage in this game of rediscovery of our Divine nature. Though the opportunity is at hand, we have shown our capacity to decimate our own existence, thus setting back the chance for imminent evolution. Myopic 'greed, hatred and delusion' as the Buddhists put it, may cause humanity to miss this opportunity, not just for the possibility of abiding indescribable Bliss, but toward the achievement of sustained 'God in Matter' and the next step in Brahman's Lila.

The following extended passage from *The Life Divine* eloquently describes the steps of evolution and ends with our participation in the unfolding process.

> But if it is once admitted that the Spirit has involved itself in the Inconscience and is manifesting itself in the individual being by an evolutionary gradation, then the whole process assumes meaning and consistence; the progressive ascent of the individual becomes a key-note of this cosmic significance, and the rebirth of the soul in the body becomes a natural and unavoidable consequence of the truth of the Becoming and its inherent law….Our explanation of the evolution in Matter is that the universe is a self-creative process of a supreme Reality whose presence makes spirit the substance of things—all things are there as the spirit's powers and means and forms of manifestation. An infinite existence, an infinite consciousness, an infinite force and will, an infinite delight of being is the Reality secret behind the appearances of the universe; its Divine Supermind or Gnosis has arranged the cosmic order….The material universe is the lowest stage of a downward plunge of the manifestation, an involution of the manifested being of this triune Reality into an apparent nescience of itself, that which we now call the Inconscient; but out of this nescience the evolution of that manifested being into a recovered self-awareness was from the very first inevitable. It was inevitable because that which is involved, must evolve; for it is not only there as an existence, a force hidden in its apparent opposite, and every such force must in its inmost nature be moved to find itself, to realise itself, to release itself into play, but it is the reality of that which conceals it, it is the self which the Nescience has lost and which therefore it must be the whole secret meaning, the constant drift of its action to seek for and recover. It is through the conscious individual being that this recovery is possible; it is in him that the evolving consciousness becomes organised and capable of awaking to its own Reality. (Ghose, 2009, Vols. 21-22, pp. 784-785)

Evolution, as described here, is the “secret meaning” of the Lila. Out of the nescience of the material universe, we are recovering our wholeness through self-awareness. Fulfilling that awareness of our Divine nature in this realm of being in time and space is the Reality secret behind the appearances of the universe. The evolution will take place through each of our life choices, through the conscious individual being.

Thus as bits of Brahman ignorant of our identity, we are given the capacity to evolve, but with no guarantee of success. The paradox is as brilliant as it is bizarre. The general movement of consciousness in the cosmos is toward awakening: to find itself, to realize itself, and to release itself into play. The force of this energetic awakening is at work in us and in everything. Yet the animal nature out of which we have emerged has consolidated an egoic center that must be transcended to achieve Sachchidananda. We are at once moved by the zeitgeist of this existence which moves us toward self-knowledge and we are left to our own devices to sort out if and how humans will collectively achieve this final step from ignorance to self-knowledge.

The Dénouement: Superhumanity

Evolution’s end, then, is a being in this realm of the material universe and individuality that knows the Sachchidananda of Brahman even as we exist on this cosmic and individual level of being. Sri Aurobindo describes our current status as a penultimate state of consciousness, near to this final stage. Our task as individuals and as a race is to grow from what we are into a more luminous existence—from pleasure and pain into a purer and vaster and deeper bliss, knowledge, and power.

> There is an evolution and we have to complete it: a human animality or an animal humanity is not enough. We must pass from the inadequate figure of humanity into a figure of the Godhead, from mind to supermind, from the consciousness of the finite to the consciousness of the Infinite, from Nature into Supernature. (Ghose, 2009, Vol.12, pp. 227-228)

This notion of Supernature and Supermind are the final stages of this Lila, the achievement of the game’s resolution. *Super-* of course suggests that which is above or beyond. Beyond mind lies the harmonious integration of Sachchidananda with our current practical worldly faculties. The accomplishment of Superhumanity is the fulfillment of the Divine play.

Superhumanity, then is beyond humanity in that it achieves the Supermind or Truth-Consciousness, that which experiences Sachchidananda, the Divinity behind and within all things, and lives in the individual poise ensconced in that level of awakened consciousness. Super-humanity is the next step in evolution and the fulfillments of this Lila.

> A life of gnostic beings carrying the evolution to a higher supramental status might fitly be characterised as a Divine life; for it would be a life in the Divine, a life of the beginnings of a spiritual Divine light and power and joy manifested in material Nature. That might be described, since it surpasses the mental human level, as a life of spiritual and supramental supermanhood. (Ghose, 2009, Vols. 21-22, p.1104)

Our next phase, should we come to achieve it, would involve a disarmingly simple task: To surrender our egos and discover the divinity that has always been there sustaining and delighting in our lives. Then the place humanity would hold is aptly described as a "Divine light" manifested in the cosmos. Humanity has access to this way of being in the world. Sri Aurobindo describes "a new consciousness in which humanity itself shall find its own self-exceeding and self-fulfillment by the revelation of the divinity that is striving for birth within it. This is the sole true supermanhood and the one real possibility of a step forward in evolutionary Nature"(Ghose, 2009, Vols. 21-22, pp. 1105-1106). Yet—to reiterate—there is ample room for failure.

The Lila may or may not be fulfilled by this species of being. Sri Aurobindo, who lived through two world wars and the inception of nuclear violence, perceived our possible failure to achieve our evolutionary potential. He saw humanity's will as central to the possibility for our potential unfolding:

> Not individuals only, but in time the race also...can have the hope, if it develops a sufficient will, to rise beyond the imperfections of our present very unDivine nature and to ascend at least to a superior humanity, to rise nearer, even if it cannot absolutely reach, to a Divine manhood or supermanhood. At any rate, it is the compulsion of evolutionary Nature in him to strive to develop upward, to erect the ideal, to make the endeavor. (Ghose, 2009, Vols. 21-22, p. 745)

The will of Brahman is toward evolutionary development. If the will of humanity is lacking, Sri Aurobindo is clear: "If, then, man is incapable of exceeding mentality, he must be surpassed…" (p. 879).

The movement of Lila, then, involves humanity in this evolutionary drama. The participatory opportunity for humanity includes all the variables in human nature that move us toward insight and wisdom. Primary among these is *will*. Dedication to awaken from our somnambulistic lifestyle will determine the fulfillment or failure of Brahman's Lila through humanity. Understanding the movement of Brahman in this larger frame of Divine Lila gives purpose to nondual insights. Sri Aurobindo's mapping of the evolution of consciousness serves as a source of inspiration to seekers of all sorts, from the committed to the lackadaisical. The movement toward a spiritual Divine light manifested in material Nature, and the knowledge that we ourselves can be that light, ought to be enough to turn our attention toward helping to resolve this Lila.

Lila

In us is the thousandfold Spirit who is one,
An eternal thinker calm and great and wise,
A seer whose eye is an all-regarding sun,
A poet of the cosmic mysteries.
A critic Witness pieces everything
And binds the fragments in his brilliant sheaf;
A World-adventurer borne on Destiny's wing
Gambles with death and triumph, joy and grief.

A king of greatness and a slave of love,
Host of the stars and guest in Nature’s inn,
A high spectator spirit throned above,
A pawn of passion in the game Divine,
One who has made in sport the suns and seas
Mirrors in our being his immense caprice.

(Ghose, 2009, Vol.2, p. 611)

Structure and Process: Integral Philosophy and Triple Transformation

Debashish Banerji[1]

Abstract: This paper looks at the ongoing debate between perennialism and pluralism in religious studies and considers the category of the integral, as described by Sri Aurobindo (1872-1950) in the context of this debate. After exploring the case for perennialism vis-à-vis pluralism, it compares the contemporary taxonomy of a perennial core to mystical experience developed by Robert K. C. Forman with the idea of the "triple transformation" developed by Sri Aurobindo as a way to the realization of an "integral consciousness." Through this consideration, it indicates the aporetic nature of an integralism which can simultaneously uphold the concerns of perennialism and pluralism non-reductively. Such an aporetic goal challenges the epistemological assumptions of the modern knowledge academy and is shown to make sense only as an ever deferred processual ontology as against the knowledge academy's telos of a totalistic structuralism.

Key Words: Integral Consciousness; Integral Philosophy; Integral Yoga; Perennial Philosophy; Religious Pluralism; Sri Aurobindo.

At the forefront of contemporary debates in religious studies is one that pits perennialism against pluralism. The idea of perennialism may be as old as *homo sapiens*, but its early modern origins in the west can be traced to figures like Marsilio Ficino (1433–1499), Giovanni Pico della Mirandola (1463–1494) and Agostino Steuco (1497–1548), Italian Renaissance churchmen and philosophers who taught the consonance of religious and philosophical ideas and the continuity of these principles from Hermetic, Cabalistic and Platonic sources to Christianity. The term 'Perennial philosophy' arose in this milieu, perhaps coined by Steuco and adopted from him by Gottfried Leibniz (1646-1716). These philosophers extended the idea that there was a core of philosophical principles (transcendental) and ideal values (subjective) which were present throughout human history and in many religions and philosophies.

Around the turn of the 19th/20th century, the idea of perennial philosophy revived with some new connotations, influenced by eastern, particularly Vedantic thinking. The mid to late 19th century American Transcendentalist movement may be seen as preparing the ground for this turn, but a hybrid east-west discourse in perennialism gained greater prominence after the 1893 Parliament for World Religions in Chicago. This event has been seen as the start of the modern

interfaith movement and had a strong universalist sentiment behind it. Swami Vivekananda's speech during this parliament highlighted the idea of Vedantic Transcendentalism, particularly through the Upanishadic image of the many rivers which lose their names and forms in the ocean (Swami Vivekananda, 1893, para. 2).

The Sanskrit term *sanatan dharma* soon became privileged as a descriptor of Hinduism tied to Indian nationalist projects. By 1909, we find Sri Aurobindo Ghosh (1872-1950) using this term, which is close to a literal translation of "perennial philosophy," as a synonym for Hinduism (Sri Aurobindo, 1997a, pp. 3-12). In this version of its use, perennialism refers to a transcendental foundation to reality which renews itself in a variety of experience throughout place and time. Though Aurobindo's understanding of the *sanatan dharma* increasingly voiced itself in terms closer to pluralism,[2] the Hindu nationalism which developed around a championing of this term, took its meaning from the privileged transcendentalism of Shankara's Advaita Vedanta. In the U.S., scholars and intellectuals affiliated with the Vedanta centers founded by Vivekananda helped in normalizing the translation of this term in terms of perennialism. Aldous Huxley's compilation *The Perennial Philosophy* (Huxley, 1970) may be thought to have completed this process through its popularity.

The publication of Huxley's book may be seen as the founding moment for the modern scholarly movement of perennialism, one championed overtly or covertly by eminent proponents such as Frithjof Schuon (1907-1998), W. T. Stace (1886-1967), Joseph Campbell (1904-1987) and Huston Smith (1919-present). Perhaps the most prominent contemporary proponent of this school is Robert K. C. Forman.

Today, the notion of perennialism seems to be the politically correct choice for a liberal spirituality, and as such has a number of connotations: (1) At the popular level, it forms the 'gospel' of 'New Age' followers, and in this context, means something vague such as 'All religions say the same thing'; (2) Even in Huxley's book, some of the connotations of the older Renaissance genealogy of 'Perennial Philosophy' continue and a number of 'perennialists' understand its basis in this form: 'There is a core of common ethical and spiritual goals; and practices leading to these to be found in many world religions'; (3) The Advaita Vedanta formulation, which has been touched on earlier: 'All the names and forms through which religions have approached God are names and forms which originate from the single nameless, formless and changeless ocean of Infinite Consciousness'.

If we consider these propositions carefully, we see that all of them are problematic in their own ways. Clearly, all religions are not 'saying the same thing'. If we talk of a core of ethical and spiritual ideals and practices, the question arises on what is to be included and what excluded from this core, as also in which religion or ideology does this core originate and where does it find its best example? Thinking of questions like these makes the contested nature of this proposition evident. As for the proposition that all names and forms of the Divine originate and lose themselves in the ocean of Infinite Consciousness, this is clearly a privileged transcendentalism, a superior truth claim that can and has been contested. Among the schools of Indian Vedanta, for example, it is one of at least three major ontological statuses which claim theistic primacy and Buddhism would not accept it either.

---

[2] See, for example, Aurobindo (2005, pp. 904-906).

The critique of the perennialist position in modern religious studies comes from a variety of directions, but all of these may be seen as forms of pluralism. Pluralism starts from an empirical and anti-idealist position and refuses to privilege a hegemonic transcendentalism. One strand of this position comes from the theological critique of Inclusivism initiated by Paul Hacker (1913-1979) and furthered by his student Wilhelm Halbfass (1940-2000).

Hacker (1983, pp. 11-28) argues that inclusivism is a typically Indian response to the problem of theism and characterizes it as a speaking for the other by co-optation. He sees the transcendental monist standpoint of Advaita Vedanta as a quintessential example of this. Distinct religious identities, histories and soteriologies are erased here in favor of something which subordinates them and swallows them in facelessness. The problematic nature of this kind of inclusivism is seen more prominently in the developmental hierarchism of Ken Wilber (1949-present), who identifies goals of becoming which are increasingly inclusive and find their culmination in a total systemic inclusion and organization corresponding to a state of nondual transcendence (Wilber, 2000). Wilber calls his system integral, but it is better characterized as inclusive in the sense of inclusivism. This can be contrasted to the integral, as I will try to show later.

Pluralist critiques of this kind of perennialism also form a basis for postmodern thinkers who find it important to preserve the right of Becoming over Being. What Hacker sees as a “typical Indian response,” is characterized by Jacques Derrida (1930-2004) as a “white mythology,” the privileging of Logos or the will to rationality, turned systemic in its post-Enlightenment modern phase, and acting as a denaturing agent attempting to translate all singularities into the terms and taxonomies of a universalist anthropology or as in the case of Wilber, a transpersonal psychology. The initiating goals of the Enlightenment are seen here as the search for a totalizing systems theory of everything of exactly the kind being proposed by Wilber, arrived at either through structuralism or through comparative studies, leading to a taxonomic organization of knowledge.

In these two forms of perennialist inclusivism, that of Advaita Vedanta and of the white mythologies of the knowledge academy, we thus find two reductions of the plural transcendental and universal respectively—one which erases the plural through dissolution and the other which tames the plural through structuration. On the other hand, in considering pluralism, an important approach is the neo-Kantian refusal of ontological realities outside the constructions of language. Each religious tradition, here, would be seen as such a construction with its historically generated corpus of signifiers and the qualitative ontologies relating to these. Even transcendence here would be inextricably bound to a linguistic singularity and retain the flavor of its history and its practices.

Are we then left with the perennial and the plural as a binary to which there is no proper resolution? It isn’t that there have been no attempts at dialog. The debate between perennialism and pluralism in our times is perhaps best exemplified in the difference in views between Robert K. C. Forman (1990) and Steven T. Katz (1978, p. 26) (who is a constructivist, holding that mystical experience takes different forms in different religious contexts). Such debates have the benefit of a dialectical engagement, which helps to expand the discourse. To account for differences in articulation of mystical experiences from different religious traditions, Forman has posited the Pure Consciousness Event (PCE), which he claims characterizes an apophatic perennial core to mystical experiences, which is translated subjectively and expressed objectively in a variety of ways. Undoubtedly this is a reduction of the field of mystical experience, and is problematic in this sense, but it is important as an attempt to resolve of the perennialist/pluralist binary.

According to Forman (1998, p.234), the PCE can be subjectively translated in terms of three kinds of experiences: he calls these theistic, monistic and nihilistic. The theistic experience pertains to all religions or sectarian practices which proceed by affective relationship with the Transcendent One. Devotional schools such as Christianity or Vaishnavism could be brought under this rubric. The monistic experience proceeds by attempting to erase all difference and realize an inclusive Unitary Source, or one Reality. Advaita Vedanta is the quintessential example of this kind of realization. The nihilistic experience pertains to a rupture from phenomenal experience and a disappearance into a Transcendental which can only be described in terms of ‘absence’, a negative theology. Various Buddhist schools could be seen as exemplifying this. Forman, therefore, refuses to privilege any of these schools, but indicates something which forms their transcendental core, but which cannot be named, except in abstract terms, such as PCE. Yet, clearly, there is a reduction here, the plural seen as subordinate and phenomenal, while the perennial becomes the noumenal essence.

This brings me to the notion of the integral, which I touched on with respect to Ken Wilber. Wilber, of course, is not the founder of the term ‘integral’, even in its contemporary philosophical or psychological usage, though his popularization of the term is swiftly turning his use of it hegemonic. In the U.S., the academic precedents for this term can be found in Haridas Chaudhuri (1913-1975) (1974), the philosopher and educationist who founded the California Institute of Integral Studies (CIIS), and Pitirim Sorokin (1889-1968), a Harvard sociologist who coined the term “integral culture” (Sorokin, 1964, p.75). The usage of both these figures can be traced in turn to Sri Aurobindo (1872-1950). The use of the term by Wilber himself can also be traced to Sri Aurobindo, whose definitions and contexts of use are thus instructive to our discussion. Sri Aurobindo uses the term “integral” in two contexts, that of an “integral yoga” (Sri Aurobindo, 1999, p.118) and of an “integral consciousness” (Sri Aurobindo, 2005, p.358).

“Integral Yoga” lays out a process of psychological integration. In his own practice of this process, we find the use of disciplines and goals belonging to a number of Indian spiritual traditions, particularly those related to certain schools of Vaishnavism and Tantra, along with practices taken from the Bhagavad Gita, an older Vedanta and the Veda. On the face of it, this may seem like another instance of the attempt to structure an inclusivistic organization of consciousness, as with Wilber. But the traditions from which Sri Aurobindo developed his transformative psychology can be seen to continue in forms which further their own cultural history in his practice. Moreover, they are not used in an additive way as components towards something which includes them, rather each one may be seen as having been expanded into a version which retains its origins but includes other elements.

In this sense, it may be thought of as an enlargement of disciplines along synthetic lines. Such processes of synthetic enlargement are not unique to Sri Aurobindo and continue the ‘unauthorized’ history of Indic spiritual traditions. It is in this sense that Sri Aurobindo’s *magnum opus* on his yoga is called *The Synthesis of Yoga* (Sri Aurobindo, 1999). In this text, we see enlarged descriptions of different traditional disciplines through a development of their own practices and goals, leading towards a point of convergence in something which he has called the Supermind, characterized by an "integral consciousness"(p. 114). It should be pointed out in passing that the term "integral yoga" is better known in the west through its trademarked version, taught by Swami Satchidananda (1914-2002). But this compendium of practices is merely additive and cannot be considered as anything more or other than this. From Sri Aurobindo's description, then, the "integral" in integral yoga pertains to a 'process' of integration which completes itself only in the structure of an "integral consciousness."

What then is an integral consciousness and is it anything different from the inclusivistic erasure of histories and the facelessness of a transcendental monism as in Advaita Vedanta? Taken from Sri Aurobindo, I would like to distinguish the integral consciousness of Supermind in terms of two primary features which distinguish it from the inclusivistic structures either of a transcendental monism or a totalistic developmental systems theory. These characteristics are:

1. The constituents of an integral consciousness are not merely its parts, assembled into an inclusive organization, but each nameable "part" is also the entire integral being.
2. To think an integral consciousness, one must think radical monism and radical pluralism at the same time.

Both these premises obey a mathematic of infinity. The first of them is also related to the famous Upanishadic verse on *Purna* (wholeness) heading the Isha Upanishad (2012):

Purnam adah purnam idam
Purnat purnam udachyate
Puransya purnam adaya
Purnam evavasishyate

That is the Whole, this is the Whole,
The Whole arises from the Whole
Subtracting the Whole from the Whole
Verily the Whole remains.[3]

One could simply replace 'whole' by 'integral' as described by Sri Aurobindo, in this verse, to arrive at an understanding of the first of the features I have laid out. To contemplate the second, it is necessary to realize that unity and infinity are not logically commensurate categories in a finite mathematics. We may think of one as a numerical instance or a grouping of finites but infinity is non-numerical. To think radical unity and radical infinity at the same time defies the laws of reason, and hence from a Kantian viewpoint, can only be considered empirically transcendental. Hence, even if we aim for such an impossibility 'processually', we cannot (and should not) conceive of it 'structurally'.

Yet this transcendentalism is quite different from a transcendental monism or from a Kantian idealism. By preserving pluralism in its fullness, it is better thought of as a Transcendental

---

[3] Author's translation.

Empiricism. In contemporary philosophy, this phrase has been used by Gilles Deleuze (2001, p.25) to describe his condition of direct access to the “virtual field” of ‘univocity’ free from conceptual structures but potent with infinite possibility at each of its points and moments. In Deleuze’s case, this “being of sensation” is arrived at through an unhinging of the mind and a return to it from the vantage of immanence. For Sri Aurobindo, one may distinguish such ontology as belonging to a consciousness “beyond” mind and thus available only to structures of becoming not presently available to us. In both cases, this is to be approached ‘processually’ and cannot be grasped ‘structurally’ due to the constraining limits of reason.

If we try to think of examples in spiritual literature describing such an ontology, where the perennial and plural are not reduced to each other, the Infinite not tamed by the Unitary but retaining its disruptive power, we find an instance in Krishna’s vision or *darshan* in the Bhagavad Gita (2012, XI: 10-46). Throughout the dialog of the Bhagavad Gita, which goes back and forth between Arjuna and Krishna, Arjuna seeks ethical and spiritual conviction for taking arms in this civil war. After many arguments, Arjuna finally questions the authority of Krishna. What is the source of Being and Knowledge which issues this call to Power? In reply, Krishna bestows on Arjuna “the divine sight,” *divyadrishti*. Arjuna then sees Krishna’s “supramental” form, the *vishwarupa*.

In this apocalyptic vision, Arjuna views something completely illogical. The Bhagavad Gita describes this in terms of a plural univocity, something in which radical unity and radical infinity coexist. Arjuna says, “I see before me an infinite radiance extending on all sides, I see all the gods, all the humans, all the sages in your body”[4] (XI: 15-19). He sees impersonality, personality, the formless, the plethora of possible forms, the past, the present and the future. He sees that which can be expressed and that which cannot be expressed. This excessive plenitude of the Personal Instance tears at his mind, since its logic of the infinite is beyond its structural limits and Arjuna pleads for Krishna to revert to his “four-handed” cosmic form. It is clear that Arjuna received something he was not prepared for. Sri Aurobindo comments on this in his *Essays on the Gita* (Sri Aurobindo, 1997b, pp. 377-395).

In trying to think radical unity and radical infinity together, we arrive at an aporia. In the *Viswarupa Darshana* of Krishna, the Bhagavad Gita parts this aporetic curtain and shows us an image which, as human beings, we cannot cognize. This is not a sundering of the knot of Becoming and a plunge into the trance of Being; neither is it a denial of Being and a revelry in the play of signifiers. This is a living at the margins of the messianic, the aporetic impossibility, where two incommensurable infinities meet. It is only at this horizon of Grace that the structures which are yet to be formed can become established, leading towards the incomprehensible ‘integral’. This is what the *Viswarupa* shows us—an evolutionary possibility, an ‘integral’ which has meaning only as emergent process beyond the limits of human capacity, never as pre-conceivable structure.

This understanding of the integral as process is to be contrasted with the inevitable misrepresentation of the idea in its entry into the knowledge academy, whether as integral philosophy, integral psychology, integral theology or integral theory. This eventuates because the modern academy is a discourse with its own rules, boundaries and expectations, and whatever enters these boundaries becomes subject to the *nomos*[5] (Bourdieu 2000, p.96) and *doxa*[6] (Bourdieu 1977, pp. 164-169) which structure these boundaries. The modern academy is a product of the knowledge drive of the Enlightenment, a will to Knowledge construed in the epistemological key, a totalistic theory of everything representable as absolute rational structure or generative grammar. The modern world is held together by the modern knowledge academy and the world market, ubiquitous and universal structures which develop increasingly transnational "integrated" manifestations subsuming cultures and histories into translated universal commodities and flavors in a realtime systemic archive. Modern 'subjects' are in this sense yoked to this enterprise of modernity, as knowledge workers within the walls of the knowledge academy, involved in producing transcendental and universal inclusivistic, referred to by Derrida (1985) as 'white mythologies'.

---

[4] Loose translation by author.

This is clearly not the 'integral' in the sense in which I have defined it, following Sri Aurobindo. It is an addition and structuration of fragments to make a potentially boundless universal fragment with a transcendental erasure of all structures beyond it. It is not the whole which is wholly present in each of its parts, nor the plural which cannot be reduced to a finite unity, nor the singular which co-exists with the infinite. This is a difference in kind not a difference in degree. This structuration becomes most dangerous when it becomes a developmental systems theory to classify things, people, classes, races, qualities in terms of their distances and degrees of progress from/to the integral. It becomes a religion worse than other religions because it harbors pretensions towards a totalitarian religion, a comprehensible and predictable 'theory of everything'.

What Sri Aurobindo's use of the "integral" implies, then, is a theory of praxis, a plural process with an incomprehensible and aporetic goal, not a structural epistemology. Still, considering Sri Aurobindo's metaphysics of the integral, as carried in *The Life Divine* (Sri Aurobindo, 2005) and his outlines of process in *The Synthesis of Yoga* (Sri Aurobindo, 1999), one could ask the question as to how such a metaphysics and psychology escapes from being a universal inclusivistic perennialism? To answer these questions, one must situate Sri Aurobindo's texts in the cross-cultural dialogic context to which they belong. Though this metaphysics and psychology appear to be written for modernist academic reading, they are also translations of an Indic discourse and meant to be considered as methodological interventions in this regard.

What translates into philosophy and psychology in an Indic discursive history are *darshan* and *yoga*, respectively. According to the norms of that discourse, these two, *darshan* and *yoga*, cannot be isolated; they are like two wings of one enterprise which privileges becoming over being—process over structure. Thus it is *yoga*, a transformative psychology which leads and *darshana*, the metaphysics, which provides a structural taxonomy and relational logic conducive to the achievement of the telos of 'yoga'. The categories and relations of theoria (*darshana*) are thus not to be seen as an absolute epistemology, but rather as a practical epistemology subservient to praxis (yoga); or, in other words, both metaphysics and philosophy constitute, between them, a system described through a theory of practice.

---

[5] Term used by sociologist Pierre Bourdieu (1930-2002) to refer to the written or unwritten constitutional law of a field; "principle of vision and division."

[6] Term used by sociologist Pierre Bourdieu to denote what is taken for granted in any society; the experience by which "the natural and social world appears as self-evident."

Metaphysical texts like *The Life Divine* (Sri Aurobindo, 2005) and psychological ones such as *The Synthesis of Yoga* (Sri Aurobindo, 1999) need to be seen as preceded by practices and ideas belonging to an Indic cultural discourse. *The Life Divine* began as a commentary on the Isha Upanishad and translates the core of this text into a metaphysical description and a practical epistemology delineating the philosophical necessity and structural properties of an "integral consciousness" and its relations to Being and Becoming at an individual and cosmic scale. Similarly, *The Synthesis of Yoga* is preceded by practices and experiences that belong to a variety of Indic yoga traditions and are articulated in terminology belonging to the cultural history of these traditions in his diaries under the title *Record of Yoga* (Sri Aurobindo, 2001). The schematic for this practice takes seven lines of synthetic discipline, thus extending a number of yoga lineages, and proceeding synchronically towards an integral consciousness. This simultaneous and synergistic addressing of the different needs and strands of human becoming, aiming each and all together at an integral consciousness, is what makes it an 'integral yoga'.

Still, there is clearly a conscious and deliberate translation from one discourse to another—from a pre-modern Indic discourse which privileges pluralism and process to a post-Enlightenment modern one which privileges a structural totalism. This is a dialogic move, an attempt to reposition the Indic discourse in a post-Enlightenment academic frame. But such a translation is also a strategic revision of the post-Enlightenment discourse, a privileging of process over structure and of the plural over the unitary (universal) or monistic (transcendental) perennial. It is also a redefinition of the perennial in terms of an integral which refuses to erase the plural or contain it in the form of a boundless finite. Such an "integral" refuses structural comprehension except as supramental telos contingent on unpredictable and creative evolutionary development.

Yet, in this translation, Sri Aurobindo does not refuse the drive for simplification or abstraction, possible from structural or comparative perspectives on the plural, so long as they are considered provisional forms of becoming and not static structures. Such simplifications can yield new synthetic practices as part of a continuing evolution with its processual possibilities. Approaching the philosophy of the plane of consciousness that can provide the integration of the plural and the unitary, in this key of a theory of process, Sri Aurobindo (2005, pp. 922-952) later formulated his idea of the triple transformation. The triple transformation is reminiscent of Forman's perennialist reduction, but seen as a creative structure of becoming rather than static structures relatively descriptive of a transcendental core.

The tripe transformation encompasses three approaches to integration, taken separately and synergistically. Actually, one may say this more properly for two of the approaches, the third being dependent on the achievement of the first two. This third is the supramental or integral transformation, which is based on an ontology of integral consciousness, discussed above (Sri Aurobindo, 2005, pp. 951-959). The first two, as preparatory stages towards the third, include a personal (Sri Aurobindo, 2005, pp. 940-944) and an impersonal (or universal) integration (Sri Aurobindo, 2005, pp. 944-951).

The personal integration, known as the "psychic" integration, is aimed at identification with the deep subjectivity' of an immanent Person, and can thus be thought of as inherently relational and theistic. The impersonal integration, known as the "spiritual" integration, is aimed at identification with universal and transcendental forms of Being and Consciousness and thus can be mapped to Forman's monistic and nihilistic perennial ontologies. The achievement of both of these integrations and their normalization in the wakened (*jagrat*) personality are considered preparations for the third integration, which, as discussed above, is indescribable and suprarational, conserving simultaneously radical pluralism and radical unitarianism in its universal and transcendental forms.

From the above, we can see a relation between Forman's perennial categories and Sri Aurobindo's integral consciousness as prepared through the categories of the triple transformation. But the formula of the triple transformation can only be understood processually, with its final integral stage an aporetic unknowable which can be experienced, if at all, through an evolution beyond the ontology of mind. The preparation for this evolution, then, requires an aspiration without content and yet a process towards an inclusivity which refuses the erasure of plurality. With this in mind, we can consider Forman's reduction of the perennial to the theistic, monistic and nihilistic, and the relationship of these categories to Sri Aurobindo's triple transformation in terms of three dimensions of spiritual experience.

The theistic dimension of immanence is the depth dimension, the monistic inclusivism may be considered the width dimension and the nihilistic transcendentalism can be considered the height dimension. These are the three dimensions of mystical mind space. The depth dimension is that which plunges us into the deepest or innermost being within us. This is the immanent divine, the "Psychic Being" or true person in each human being. This hidden subject is the source of a process of internal integration, an alignment of body, life and mind through a one-pointed theistic exclusivism. But this can simultaneously move towards a dialogic universalization, leading towards the transpersonal and impersonal, an identity with the width dimension.

The width dimension is the cosmic consciousness, it is everywhere, spatially pervasive; one can think of a cosmic or universal physical existence, a cosmic or universal life-energy or vitalism, a cosmic or universal ideation or mental existence. The extreme realization of such a cosmic consciousness would be a spatialized inclusivism, the absolute systemic structural epistemology sought secretly by the "white mythology" of the Enlightenment (or its temporal extension, the post-Enlightenment academy). Of course, the academy seeks this as structured information archive, but in subjective space, this inclusivistic cosmic consciousness is given by Sri Aurobindo the name of Overmind. Beyond the structural Monism of Overmind is the transcendental Monism of Sacchidananda, the nameless, formless, causeless and timeless ocean into which all individual and universal categories are swallowed and erased. This can also be seen as a nihilism, since it is absolute and relationless and experienceable only in a trance of exclusion.

Though Forman asserts a common "perennial" transcendental core to these three dimensions, clearly there are discontinuities between these as experienceable by mind-constrained creatures, due to the exclusivism of their categories, including an exclusive monistic inclusivism. A pure or exclusive theism loses both the relative and pure monisms. This can be asserted for each dualistic school of practice. Similarly, a pure or exclusive monism/nihilism loses the theism of the psychic being as well as the relative monism of the Overmind. Yet, as indicated earlier, the Psychic Being can expand its theism dialogically, moving towards the inclusive pluralism of Overmind. Though this may be thought of as a taming of the plural, a boundless finite rather than a radical infinity which co-exists with a radical unity, such a universalized monistic theism may be thought of as a preparation for the aporetic supermind. Refusing both an exclusive theism and an exclusive monism as forms of telos, one may approximate to this human correlate of supermind as a horizon opening to a yet nameless horizon. This purveyor of the unthinkable integral becomes the philosophical telos which magnetizes our becoming, the fourth dimension which gathers to itself the three dimensions of mystic mind without erasing them or their singularities, and capable of projecting them individually and exclusively as dimensional spaces of experience.

Thus, there is no proper order to the process leading to Supermind. Nor is there a proper tradition. One may approach from any tradition, but one must have a will to the integral, as that which is plural, cosmically inclusive and transcendental all at once, without the erasure by any of any of these states. Such an aporetic and unthinkable experience can be an evolutionary telos, approachable from any tradition as starting point. As part of the Enlightenment's academic drive to discover an integral anthropology, we can consider the building of this transhuman/posthuman trajectory through an archive of practices and a phenomenology of experiences that respect these three dimensions of mystical space as the precursor to arriving at integrality. It is when our language culture changes to a point where we can express these dimensions of experience synthetically and can envisage the aporetic horizon in the currency of communication that we can tell ourselves that we are approaching the gates of an integral psychology or an integral philosophy. Before that, not to see it as an incalculable process aimed at the unthinkable, is nothing if not dangerous.

United Religions Initiative: Global Community Emerging

Sally Mahé[1]

Abstract: This article provides a brief introduction to United Religions Initiative (URI), a global grassroots interfaith network that promotes peace and justice through intercultural and interreligious dialogue using a process known as 'appreciative inquiry'. While accomplishments of URI are highlighted, it is emphasized that more cooperation, more compassion, and more commitment to good relationships will be needed across the world for global unity, justice and peace.

Keywords: United Religions Initiative; URI; Global Community; Interfaith Movement; Interreligious Dialogue; Cooperative Inquiry.

In the mid 1990s, as a new consciousness was emerging that advocated cessation of killing in the name of religion and cooperation for peace, a frequent response was: "impossible"! People bantered that the history of humanity overflows with different religions fighting each other. Clearly, something different was needed if "impossible" was going to give way to inevitable.

What can help shift historic patterns of hostility, ignorance, isolation and political manipulation among religions to unprecedented levels of friendship and collaboration among people of different faiths?

In 1995 upon the occasion of the 50th anniversary of the United Nations (UN), Bishop William Swing, the Episcopal Bishop of California, boldly asserted: "If the nations of the world are working together for peace through the UN, then where are the world's religions?**"** (http://www.uri.org/about_uri/charter, Para.1). Experts heard his call. Dr. David Cooperrider, Professor of Organizational Development at Case Western Reserve University, donated four years of commitment, expertise and talent. Dee Hock, founder of VISA turned organizational visionary, brought a design plan and confidence that a "bottom up" organization was not only possible but imperative to accomplish the goals of interreligious harmony. People from all parts of the world were invited to assess the strengths they brought to this possibility and envision a new kind of organization into being. The organization came to be called United Religions Initiative (URI). It was to be: inclusive, self-organizing, dependent on people at the grassroots,

SOME RIGHTS RESERVED

honor equal participation of women and men, encourage youth participation, and bring together a maximum mix of stakeholders from all sectors of society.

The first phrase of URI Charter's Preamble grew from thousands of conversations. "We, people of diverse religions, spiritual expressions and indigenous traditions throughout the world, hereby establish the United Religions Initiative to promote enduring, daily interfaith cooperation, to end religiously motivated violence and to create cultures of peace, justice and healing for the Earth and all living beings.
(http://www.uri.org/about_uri/charter/preamble_purpose_and_principles, Para.1).

Since its Charter was signed in 2000, the United Religions Initiative has grown to include more than 550 grassroots groups and organizations in 79 countries. Each group or organization is self-sustaining and retains its own identity but is also part of URI's global network of Cooperation Circles (CCs). Each Cooperation Circle has its own name, size (minimum of 7 members), governance structure and mission, and they all share a commitment to diverse participation and to advancing the central purpose and principles of URI. As a URI core staff member for over 16 years, I've had a good seat from which to participate in developing a global organization that believes in the power of people to self-organize in order to fulfill their aspirations for peace, justice and healing.

So, what are we seeing? What is our experience teaching us?

A Common Document Rooted in Shared Values Provides Stability

Diverse people are compelled toward action by purpose and principles that articulate their core values, passions and longings. In the United States, citizens are stirred by the words of the Preamble to the Constitution: "We, the people of the United States, in order to form a more perfect Union…" (http://www.archives.gov/exhibits/charters/constitution_transcript.html, Para.1). In the same way, people have consistently been drawn to the United Religions Initiative by the words of its Charter. URI's preamble, purpose and principles call people to a common cause, guide behavior, bind people together and open opportunities for long-term, diverse, and high-functioning grassroots activities.

Recognition and Appreciation: Focusing on What Works Rather Than What Doesn't Work Is Worth More than Money

An enduring reality of a grassroots activity is that most people involved are not paid but act from personal commitment. Working with hundreds of groups in URI and watching when folks come alive and when they wear out, I realized that people, like flowers, respond to essential 'nutrients', among them the need to be recognized, to be successful, to have their value amplified, and the meaning of what they do deepened.

URI as an organization embraced an approach to positive change called Appreciative Inquiry (Cooperinder & Whitney, 1996, 2005; Cooperrider, Whitney & Stavros, 2008). Wilted from tedious work, crises, hatreds and injustices that overwhelmed their dreams and positive efforts, we found people coming back to life when a simple organizational process gave them a chance to remember their core values, renew their sense of personal power, and imagine a world worthy of their children.

At its birth, URI was gifted with Appreciative Inquiry (AI), a leading approach to organizational development. Methodologically, AI is an approach toward positive change, as well as a point of view that seeks to emphasize: a) what is working well in an organization; b) important values that people bring to their work; and c) the aspirations and visions of achievement that are shared by all of its stakeholders. According to David Cooprinder the founder of AI, "In its most practical construction, Appreciative Inquiry is a form of organizational study that selectively seeks to locate, highlight and illuminate what are referred to as the life-giving forces of an organizational existence. Appreciative Inquiry seeks out the best of what is to help ignite the collective imagination of what might be"(Cooprinder & Whitney, 1996, p. 3).

Appreciative Inquiry became part of United Religions Initiative's DNA as it found its footing in creating safe spaces for people of different traditions and faith backgrounds to come together in respect and cooperation. In its early years, when the voices of doubt were loudest, Appreciative Inquiry helped URI focus on the quality of our questions and the ability to spark people's imagination toward what is not here yet, but what might be.

Maintaining the Tension Between Giving Guidance and Leaving Freedom to Innovate Produces Positive Results

Giving unlimited numbers of people the freedom to innovate creates an amazing and unanticipated diversity of activities and impact. Cooperation Circles (CCs) take on activities as diverse as creating a Golden Rule Day Proclamation for their city, to maintaining ambulance service for a village, to calling scholars to share papers on the intertextuality of Holy Books. However, grassroots support also calls for systematic guidance and training. An organizational culture that welcomes this tension by encouraging unbridled innovation while providing guidance and training, is challenging but constructive.

URI has learned that people in Cooperation Circles run out of steam, leadership changes or expertise may be lacking to fulfill aims. In addition to providing an open field for initiatives to flourish, a grassroots-led community also needs to provide emotional support, bright ideas and training in various kinds of competencies. To support people in CCs, URI provides some training in such as areas as peacebuilding, fundraising and management.

Conversation and Dialogue Balance Action-Oriented Programs

Early analysis of URI interfaith groups indicated an even split between those organized around conversation and sharing spiritual practices, and those involved in action/service-oriented programs in their communities. Over the years, however, a pattern emerged across cultures that grassroots groups involved in interfaith work often choose a combination of "inner work" and "outer work."

Recently, speaking with members of the Interfaith Council of Bainbridge Island in Washington State, I experienced renewed commitment as we went around the circle sharing stories of faith and life experience. Active interfaith work that takes on vexing local issues will continue to be reinvigorated, balanced, and anchored by such sharing. Most often, especially in areas of entrenched conflict, such as in the Middle East, grassroots interfaith organizers find that their personal relationships with so-called “enemies” make the biggest difference in their lives and propel their work.

Platforms to Connect Grassroots with Policy Makers Are Critical

Over the years, URI has seen effective alliances among students, religious leaders, civil servants, government officials, the military, the media, and corporate executives. Making an effort to reach out to ‘sectors’ we don’t normally interact with is invaluable in creating opportunity for significant change. In August 2011 in Kampala Uganda, URI leaders in the Great Lakes region of Africa organized a two-day gathering where an Ugandan army colonel, students from Makere University, locally based NGO leaders, diverse religious leaders, political officials and the Vice President of Uganda joined in common cause in an unprecedented meeting to raise different perspectives and share commitment to securing peace and reducing terrorism in Uganda. People who might have been considered others in the room to be ‘the enemy’ or ‘out of reach’ began to experience themselves as allies.

Strong Relationships Create Community Resilience

Strong community relationships help unleash people’s resilience, creativity, and hope whether preparing for disaster relief, responding to crises, or sharing the doom and gloom surrounding issues like the economy, peace, and the environment. Grassroots organizing among people from different faiths creates such relationships and strengthens communities in times of difficulty. When terrorist bombs hit the island of Bali, an already established interfaith community ran to the scene to offer joint prayers of grief and support. In New Orleans, it is well documented that faith communities, networked to some degree with one another, provided the most successful response to the devastation of Hurricane Katrina. We may be living in a dangerous world for quite a while. Grassroots organizing emphasizing relationship-building and cooperation skills is a sterling investment in community resilience and ultimately survival.

What Does the Future Hold?

Grassroots organizing has the opportunity to wield new power as communication tools emerge connecting humanity across continents and to bridge historic divides of all kinds. New networking and new relationships are developing everywhere and interfaith activists have gotten the message. More and more, responsibility for positive change will be distributed among the many taken up by “we, the people.” More competence, more cooperation, more compassion, and more commitment to good relationships will be needed across cultures and among people everywhere as we learn how to tap “the better angels of our nature” and exert our collective influence to make a better world.

Editorial

Welcome to another regular issue of *Integral Review*, which launches our ninth year of publishing new thought, research, and praxis. In the coming months we will roll out an upgrade for IR's website, with new features and a new look. We look forward to this upgrade serving readers' interests better with an increase in functionality!

This current issue is comprised of three substantive-length academic articles that are joined by two reviews and an essay. Prominent characteristics of these contributions include the careful deployment of integral and adult development insights in meaningful applications to academic and social analyses as well as research, along with the persistent attention to the vital role of multiple perspectives weaving through all contributions. And finally, each contributor offers distinctive frameworks we believe a wide spectrum of readers may find useful in their thought, research, and praxis.

Henry Lebovic analyzes the work of prominent peace scholar-practitioners John Burton and John Paul Lederach in his master's degree thesis, *Towards a Coherent Unity of Perspectives on Peace: Burton, Lederach and the Philosophy of Ken Wilber.* He investigates how the integral model and Spiral Dynamics serve analyses of the causes and sources of conflict, and the limitations to date of peace theory and practice. In light of that analysis and in reviewing the small body of "integrally-aware" peace scholarship, he suggests how integral theory might emerge as an important tool for analyzing and shaping future peacebuilding initiatives, and demonstrates the value of developmental analysis of scholarship and practice.

In *The Spectrum of Responses to Complex Societal Issues: Reflections on Seven Years of Empirical Inquiry,* Thomas Jordan, Pia Andersson, and Helena Ringnér synthesize learnings from their work in nine empirical studies to offer practical insights and cautions about individual and group capacities for managing complex issues. Analyzing the variability in performances, they offer a preliminary typology of functions—of facilitators and of groups—that may need to be scaffolded for methods to accomplish intended objectives. In reporting on their learning about individual societal change agency, they offer a typology of four types of societal entrepreneurship and a detailed discussion of the properties of dialectical meaning-making in societal change agency.

Elizabeth Ann ("Annie") Wilson Whetmore employs a developmental integral lens to analyze changes in marriage laws and related cultural norms and values in the United States across the last several decades. In *The Dynamics of Marriage Law and Custom in the United States* she builds her analysis of worldview shifts via her own typology of specific domains (which she calls "lines of development") to explain how she correlates traditional, modern, and postmodern worldviews with shifts in law and custom. Her discussion considers the implications of these shifts for ongoing change to US marriage law and custom, and specifically for marriage, sex, pregnancy, and stresses for women.

Michael Schwartz reviews *Integral Sustainable Design: Transformative Perspectives,* edited by Mark DeKay with Susanne Bennett, which he asserts is "the single most important book on

SOME RIGHTS RESERVED

architecture I have ever read." He recommends the book not only as manual to guide the field of sustainable design, but also well beyond design to "all manner of integralists and meta-theorists." Notably, judging from his own experience, he suggests the book for general readers because it may "profoundly change one's day to day experience of the built environments in which we dwell."

When Thomas Jordan discovered Verna DeLauer's *The Mental Demands of Marine Ecosystem-Based Management: A Constructive Developmental Lens,* he felt convinced her methods and insights would benefit a wide audience. His review of her dissertation explains why he asserts it as "a very important contribution to our understanding of the preconditions for developing our societies' capacities for managing complex issues."

The foregoing contributions shed light on a range of interests, and the final essay by Swasti Vardhan Mishra sheds a light on India's experience when the lights and power went out in its 2012 blackout. In *The Great Indian Blackout and Elements of Positivity,* he offers a perspective from his lived experience of the event and his observations of positive effects on at least some Indians' unity, cohesiveness, and equality. His positive orientation is extended to considering how the event's circumstances and effects may actually be good news about India's economic and political development, in contrast to critics' stances. He illuminates how the light of positivity can enable new ways of seeing when we think we're in the dark.

As always, we hope you enjoy the richness offered by this issue's diverse contributors, and find ways to benefit from and use their insights, analyses, typologies, and passion for developing our capacities and perspectives to serve our complex world!

Towards a Coherent Unity of Perspectives on Peace: Burton, Lederach and the Philosophy of Ken Wilber

Henry Lebovic[1]

Abstract: This master's degree dissertation uses the philosophical schema of Ken Wilber, known as the integral model, and the Spiral Dynamics® approach based on psychologist Clare Graves' work and promoted by Don Beck and Christopher Cowan, to explore the work of peace scholar-practitioners, John Burton and John Paul Lederach. It asks: Can the Integral model and Spiral Dynamics be utilised in analyses to explore the causes and sources of conflict, and the limitations of peace theory and practice? If so, can these schemas be used prescriptively to help design more effective approaches to peacebuilding? Such an analytical schema reveals that Burton's human needs theory makes claims to holism that ultimately fell short, primarily because of the reduction of culture to behaviour. In addition, his reliance on cognitive approaches and the aspect of assumed neutrality were found to be problematic. In contrast, Lederach's concern with subjective causes and solutions of conflict was closer to the "integral holism" Wilber advocates. Lederach's values, which were made more explicit than Burton's, were also found to be congruent with the second-tier value approach of Spiral Dynamics. Furthermore, research within the peace studies literature, as demonstrated here, lends support to the experimental analyses conducted in this dissertation. Finally, the small body of "integrally-aware" peace scholarship, which is also reviewed, illustrates how integral theory might emerge as an important tool for analysing and shaping future peacebuilding initiatives.

Keywords: Conflict resolution, conflict transformation, human needs theory, John W. Burton, John Paul Lederach, peacebuilding, Spiral Dynamics®

Introduction

My own intellectual journey has taken me from science and technology, via almost twenty years spent in the corporate I.T. world, to the study of peace and conflict. Along the way, I discovered the philosophical model of Ken Wilber, a contemporary American writer of the last 30 years and I came to three observations that grow in salience as my journey into the social sciences progresses. These observations form the motivation of this dissertation for my master's degree in peace and conflict studies.

First, theories that are powerful in a particular context seemed to provide only partial answers at best, or are of minimal value at worst, when applied outside the domain defined by their assumptions and core knowledge. This includes many of the "ideas" I encountered in the I.T.

world concerning human behaviour, as well as much of what I learnt about modern economics such as the construct of "homo economicus" or "economic human."[2] Second, I came to believe that interdisciplinary approaches may be an antidote to that partiality, because of the variety of perspectives these disciplines span and because the knowledge and understanding that emerges is greater than the sum of the parts that constitute it. I came to understand this concept as holism and discovered it was a purported characteristic of peace and conflict studies. Finally, I observed, both in everyday life and in academia, that ideas and theories were necessarily predicated on a particular worldview or set of values. However, frequently these were not made explicit and in many cases, seemed unconscious to those who espoused them. Those values, it appeared to me, shaped and limited the application of the theory, from how and what data is gathered, through to the way methodologies are constructed, research planned and results evaluated.

The study of conflict and peace and the practice of peacebuilding claims to be far more explicit with respect to its values and actively seeks to employ an interdisciplinary, more holistic approach to research and practice. However, is this really so? If it is, to what extent do those values shape theories? Is there a framework for bringing disciplines together in a coherent way? By utilising Wilber's model, would it be possible to create a set of lenses through which theories could be tested, both for the limitations outlined above and for their durability and wider application to more complex human problems? To explore these questions, I examine the work of John Burton and John Paul Lederach, in particular. These two theorists have been selected in large part because they are well regarded and remain popular within contemporary peace and conflict studies, and are well documented and widely discussed within the literature. The work of others such as Norwegian peace scholar, Johan Galtung or American peace educator, Betty Reardon would also be a valuable addition to these two theorists for the same reasons I have outlined. However, time and space constraints prevent this here and a future examination along these lines would be an extension of this research.

In this research, then, I ask two questions:

1. Can Wilber's "AQAL Model" and the related Spiral Dynamics®[3] schema be used in an analytically descriptive manner to explore the causes and sources of conflict, and the utility and limitations of peace theory and practice?
2. Can those schemas be used prescriptively, to help design more effective approaches to peacebuilding? In other words, is the complexity of violent conflict and the challenge of sustainable peacebuilding best dealt with by Wilber's "integral approach" and Beck and Cowan's second-tier value systems ("vMemes")?

Ken Wilber's AQAL model is not a theory about peace and conflict. Its roots lie in sociology, psychology, the physical sciences, cultural studies, phenomenology, spirituality and religion, amongst others. While it is primarily regarded as a theory of philosophy, its breadth and eclectic roots are likely to remind readers of theories from these other disciplines, including some from peace and conflict studies. Wilber's model can be described as a map providing a way to view and explore other theories and ideas. It is often called a meta-theory (Esbjörn-Hargens, 2009, p. 1) in the sense that it is beyond a theory – it can be thought of as situated above the landscape of specialised theories, providing a view from which one can spot relationships, trajectories and even vacant territory regarding theoretical locations. The word "integral" is key to Wilber's model. An "integral" approach, by Wilber's definition, is one that tries to include as many perspectives, styles and methodologies as possible within a coherent view of a topic (as cited in Esbjörn-Hargens, 2009, p. 1). The integral map has five distinct components or elements: (Wilber, 2006, pp. 1-40)

---

[2] This refers to the abstraction of a narrowly self-interested, rational human in pursuit of maximum wealth for minimum effort. The term was coined in reaction to the political economy of John Stuart Mill. See Persky, 1995, pp. 221-231.

[3] "Spiral Dynamics" is a registered trademark. The ® symbol is indicated in only this first use of the trademarked name; hereafter, Spiral Dynamics is used.

1. Quadrants: encompassing the perspectives of intention, behaviour, culture and society.
2. Lines or streams of development (i.e. intelligences, capacities, e.g. cognitive, emotional, moral, values).
3. The stages through which those lines progress, revealing greater complexity.
4. States of consciousness.
5. Personality types (e.g. gender).

I will be considering only the first three of the above elements because they are the most directly relevant to the three observations stated at the beginning of this section. The term "AQAL," which stands for All Quadrants, All Lines, is derived from the first two elements above. The term implies that an "integral" approach requires a consideration of all quadrants, all lines, all stages, all states and all types. The use of development lines and stages will focus primarily on the values lines which Wilber identifies and which is developed in more detail by the Spiral Dynamics theory of Graves (1974), Beck and Cowan (1996). The stages within this line of development are also known as "value Memes" or vMemes and they are colour-coded for ease of recollection (see below). The theory identifies particular patterns or types of values as they emerge and matches them to the types of challenges they are best suited to addressing.

This work draws upon academic literature in diverse and germane areas: the philosophical theories of Ken Wilber and what I consider to be subsidiary psychological theories by Clare Graves, Don Beck and Chris Cowan; the published works of John Burton and those of John Paul Lederach; academic articles reflecting on the work of Burton and Lederach and peace theory and practice relevant to the analyses conducted herein; and lastly a small body of work which represents the first steps in integrating Wilberian ideas with peace practice. In the case of the major academics I examine, I focus primarily on their significant and later works, in an attempt to accurately capture their most mature views. In the case of Lederach, the progression of his writings is also of some particular interest.

The first section outlines the three elements of Wilber's model indicated above in sufficient detail to allow the reader to engage in the analysis that follows. This includes examples, but it does not make any explicit connections to peace and conflict theory. In the following two sections, Burton and Lederach's work are summarized, drawing out those particular aspects that are to be the subject of the descriptive analysis of the second part of each of those sections. The analysis determines the extent to which they could be considered integral, by Wilber's definition. This includes a four-quadrant analysis, an examination of various "development lines" and their prominence, and a consideration of the value Meme (vMemes) that are evident in the theories and practices.

The first part of the fourth section compares the observations derived from applying Wilber's model to Burton and Lederach's theories with peace and conflict literature. This analysis finds some striking similarities and starts to paint a picture of the prescriptive value of the AQAL model to peace and conflict theory. Practitioners and theorists in a number of disciplines have begun to develop more complete, holistic approaches to the challenges in their specific fields. The second part of this fourth section considers how this could begin to be undertaken in peacemaking, using Wilber's model as a schema and Burton and Lederach's models as components. A handful of examples are documented by way of illustration.

It is argued here that integral theory could become a valuable tool for the analysis and prescription of peace theory and peacebuilding practice. The analyses undertaken in this dissertation are not only illustrative of how to use integral theory as a set of lenses, but they also suggest how it may be possible to move towards a coherent unity of perspectives on peace. The suggestions for further research in the conclusion advances this goal by expanding both the frame of analysis and the scope of peace theory.

Section One: An Introduction to the Integral Model

Since his first book in 1977, Ken Wilber's ideas have been refined and expanded over a series of books. With a background in the sciences and yet, deeply interested in the spiritual traditions from across the world, Wilber's drive has been to create a synthesis of the wisdoms and insights already available to humanity in a coherent way that can provide a practical map for navigating our future. His sources include the insights of both East and West, from science and religion, and from the perspectives of pre-modern, modern and post-modern.

This section begins by examining the ideas of holism and integralism, as Wilber uses them. These ideas are underpinned by the notions of holons, holarchy, and the existence of non-reducible perspectives, corresponding to domains of knowledge. The domains, which form the four quadrants of the Integral model, are then explained in detail. An inherent aspect of these quadrants is the unfolding of greater depth and complexity, as manifested in the development lines and stages and this is examined here. Particular attention is paid to the development in the subjective quadrants as they relate to human experience. The values line is then explored in more depth, because of its relevance to the examination of Burton and Lederach that is undertaken in the subsequent sections.

From Holism to Integral

But what is really meant by holism? For Wilber, the key underlying concept is that of a holon. In 1995, Wilber formulated his twenty tenets concerning the patterns of existence or tendencies of evolution. In the first of those tenets he asserts that "reality as a whole is not composed of things or processes but of holons. Composed, that is, of wholes that are simultaneously parts of other wholes, with no upward or downward limit" (Wilber, 2000b, p. 43). Thus, he sees reality as a hierarchy of holons – or a holarchy, in which there are an infinity of holons, each of which is a part of a still greater holon.

Wilber warns about two particular dangers that are common in our modern world. The first stems from the assertion that a particular holon is in fact the ultimate “whole,” that is, it is not a part of anything greater or more complete. This leads to repression and domination of higher holons over lower ones, often through the use of force. This can be entrenched in what Eisler calls “domination hierarchies” (as cited in Wilber, 2000b, p. 30). The second danger is what Wilber calls gross reductionism, which is the practice of reducing all material systems to material atoms – often called atomism.

In a sense, Wilber’s Integral framework is his attempt to make holism operational in the totality of human affairs. He understands “integral” in the sense of “comprehensive, inclusive, non-marginalizing, embracing” (as cited in Esbjörn-Hargens, 2009, p. 1). Key to achieving that is the recognition of four fundamental perspectives, which can be summarised as: subjective or intentional, objective or behavioural, inter-subjective or cultural and inter-objective or social (Wilber, 2000a, p. 73).

The AQAL Model’s Four Quadrants

These perspectives are known as the four quadrants and are often shown diagrammatically (such as in Wilber, 2000b, on p. 127). The two axes that divide the whole into four are based on two distinctions: the interior versus the exterior and the individual versus the collective. Thus, the upper-left quadrant corresponds to the internal perspective of an individual. It is concerned with psychology, spirituality, meaning and intentionality. This is characterised in language as the “I” perspective. The upper-right quadrant is the external view of individuals and is concerned with behaviour and observable phenomenon. The pronoun related to it is “IT.” The lower-left is the cultural dimension, or the inside awareness of the group and its worldview, its shared values and meanings, shared feelings and so forth. Its perspective is encapsulated by the pronoun “WE.” Finally, the lower-right is the social dimension (or the exterior forms and behaviours of the group, which are studied by third-person sciences such as systems theory. Characterised by the pronoun “ITS,” it includes the social, institutional, legal and political domains.

One of Wilber’s most compelling insights is that for a view to be considered “integral,” all four quadrants need to be included or considered. Problems emerge when you try to deny, dismiss or reduce any quadrant or perspective to another one (Wilber, 2006, p. 28). In particular, he warns against the attempt to reduce interiors to their exterior correlates, that is, collapsing subjective and inter-subjective realities into their objective aspects. This is known by some as “scientism” and Wilber gives this frame of reference the name “flatland” (Esbjörn-Hargens, 2009, p. 3). In other words, when all "I's" and all "we's" are reduced to systems of interwoven "its,” we are engaged in a form of subtle reductionism (Wilber, 2000a, p. 73).

This type of reductionism is widespread. It is practiced, for example, by those neuroscientists who reduce all mind states to brain functions, asserting that consciousness is an epiphenomenon of brain activity. Similarly, it is being practiced by those systems theorists who reduce all culture and collective meaning to systems of interacting, autonomous units. Wilber does not deny the validity claims of science and empiricism, acknowledging that they accurately and importantly report on the exteriors of various phenomena. However, he is critical of an aggressive imperialism that some scientists engage in when they try to “corner the market on truth” (Wilber, 2001, p. 21).

Reductionism in the opposite direction is also a concern for Wilber. Denial of the objective quadrants is a feature of extreme cultural constructivism. While Wilber supports the validity claim that many ideas are constructed according to various interests (power, sexism, racism etc), he is critical of any who might argue that only the lower-left (cultural) quadrant is “real” and deny the existence of objective truth(s) (Wilber, 2001, p. 23). In analysing the popular constructivists, he in fact finds that they do admit some objective truth and system, including Baitaille, Derrida and Foucault (Wilber, 2000b, pp. 45-47).

One way that the four quadrants can be applied to conflict is in the analysis of behaviour. Such an analysis might start with questions such as “how do we behave?” and “why do we behave in the particular way we do?.” The first question is observational and descriptive in nature, so, while important, it is not analytical. The process of answering the second question can lead towards particular quadrants, depending on the analytical perspectives employed. One answer might be “due to socio-political and structural factors,” which leads to the lower-right (social) quadrant. Another answer is "because of brain states and chemistry, genetic characteristics and defects,” which implicates the upper-right (behavioural/empirical) quadrant. Alternatively, we might conclude, “it is a part of our culture and therefore is meaningful to us,” leading directly to the lower-left (cultural) quadrant. Finally, we might conclude, “it is rooted in our intentions, emotions, personal desires and beliefs,” which lands us in the upper-right (intentional) quadrant. Each of these answers may be simultaneously correct, or partially correct. Wilber’s model does not predict or prescribe what the answers to such questions will be in any specific case, but it does encourage a consideration of each of the possible answers as part of the analysis. In this way, an integral (or relatively complete) understanding is possible and derived action is likely to be more robust.

Wilber’s quadrant model not only describes the basic dimensions of our own awareness, available to us at any time, but also a set of (at least) four perspectives with which to analyse and understand any situation in our world (Esbjörn-Hargens, 2009, p.7). However, it is often not enough to just be aware of the quadrants— it is also necessary to work with the depth and complexity within each domain (Esbjörn-Hargens, 2009, p.10).

Depth and Complexity: Developmental Lines and Stages

Since the work of Howard Gardner, educators, parents and the general population have become aware of the idea of diverse human capacities, or “multiple intelligences” that each of us possess. Although inter-related, each one is relatively independent and each one shows different levels of maturity or development within a single person. Gardner’s work builds upon the insights of the developmental structuralists, such as James Mark Baldwin, Jean Piaget, Jean Gebser, Abraham Maslow and numerous others. As Wilber (2007) explains, together they have revealed the nature of stage-like development within human consciousness (p. 55).

Wilber’s own model asserts that such developmental lines or “streams” exist in each of the four quadrants. Within the upper-left quadrant, humans possess approximately a dozen development lines including cognitive, moral, interpersonal, emotional, psychosexual, kinesthetic, self, values and needs (Wilber, 2007, p. 58). Each of these capacities unfolds in various stages that are usually enduring and stable. They are also referred to as levels, because each represents a level of organization or a level of complexity (Wilber, 2006, p. 7). Each level is also a holon, because a stable, healthy level transcends, yet includes the previous level, building on their predecessors in specific ways which imply that stages or levels cannot be skipped (Wilber, 2006, p. 13).

Examples of the stages of development as they occur in each of the four quadrants can be seen in Wilber (1996, p. 1). There are strong correlates between the subjective and inter-subjective, particularly in the later stages shown. The archaic, magic, mythic and rational cultural stages map quite well onto the stages of psychological development of modern humans, a point that will be explored in more detail below when discussing Spiral Dynamics. By its very nature, development in the objective quadrants is more readily apparent. For example, in the upper-right quadrant, there is an increase in complexity as we follow the stream of development from atoms to molecules to cells to various types of organisms. Significantly, the progressive unfolding of the physical and social spheres is strongly correlated to that in the subjective (left-hand) quadrants. Similarly, in the social quadrant, there is an increase in complexity from foraging tribes, through horticultural and agrarian communities, on to industrial nation states, the modern informational states and a potential, future planetary society. Each of these societal structures is characterised by particular types of cultural holons. Although the correlation has been observed for some time, the causal relationship is not clear. Wilber holds the view that these levels are indications of an expanding, increasing consciousness, becoming more inclusive as you move up the holarchy. He sometimes expresses this as a movement from sub-conscious to self-conscious to super-conscious (Wilber, 2003, time index: 12m 45s). Alternatively, the progression can be described as one from pre-conventional to conventional to post-conventional, with each higher level exhibiting more depth and complexity than its predecessor.

Graves and Beyond: Values and vMemes

But why is the multiplicity of development lines, particularly those related to our subjective experience, important? Wilber proposes that each development line is, in fact, found in the responses we discern to the various questions life poses. For example, the cognitive line, as studied by Jean Piaget, is the response to the question, “what am I aware of?” Similarly, “of the things that I am aware of, what do I need?” is the question at the heart of needs development, as studied by Abraham Maslow. In response to the question, “of the things that I am aware of, what is the right thing to do?” we find the stages of moral intelligence, explored by Lawrence Kohlberg. Finally, the question, “of the things that I am aware of, which do I value most?” is answered in different ways based on one’s value system, first studied by Clare Graves and now a part of the Spiral Dynamics framework (Wilber, 2007, pp. 59-60).

The psychologist, Clare W. Graves, conducted his own research into values and human development from the 1950s through to the 1970s. He concluded that humans moved through various “levels of existence,” each of which was characterised by specific behaviour and values. Each stage was a response to specific life conditions and thus a person's psychology can change as the conditions of their existence changes. Graves (1974) argued “man is learning that values and ways of living which were good for him at one period in his development are no longer good because of the changed condition of his existence" (p. 72). Graves saw adult human psychology as an “unfolding, emergent, oscillating, spiralling process" in which humans moved through six “subsistence" levels, whose overall goal was individual survival and dignity (Graves, 1974, p. 73).

Graves’ work was expanded by Don E. Beck and Christopher Cowan and named Spiral Dynamics in their 1996 book. They reframed the levels in terms of "memes,” a term originating with Richard Dawkins who used it to describe a unit of cultural information. Later, psychologist Mihaly Csikszentmihalyi conceived of them as information units in our collective consciousness – a sort of intellectual virus that reproduces itself, from person to person and generation to generation. Beck and Cowan (1996) coined the term “value meme” or vMeme to describe a meta-meme that binds the smaller memes that had concerned Dawkins and Csikszentmihalyi. In essence, Graves’ “levels of existence” became these vMemes, colour-coded for convenience (Beck & Cowan, 1996; also see http://www.spiraldynamics.net/ and http://spiraldynamics.org/).

1. Beige: Semi-Stone Age
2. Purple: Tribal
3. Red: Exploitative
4. Blue: Authoritarian
5. Orange: Entrepreneurial
6. Green: Communitarian
7. Yellow: Systemic
8. Turquoise: Holistic

Beck and Cowan explain vMemes as the basic package of thought, motives and instructions that determine how we make decisions and prioritise our lives. In other words, they are the structure of thoughts, rather than the specific contents of thinking. These vMemes form an ordered spectrum of value systems, divided into two distinct tiers. Beck and Cowan explain that the values we hold are dependent upon both the conditions and circumstances of our lives and the way we respond to those circumstances and conditions (pp. 52-56). Obviously enough, this is the process of how a person grows and changes. The important point is that neither life conditions nor adaptive capacity is fixed: growth and change regularly occur. And the schema outlines how these changes unfold in a more or less ordered sequence. Beck and Cowan assert that higher vMemes increasingly offer more explanatory power and greater freedom to act as life's conditions become more complex (pp. 40-43). Thus, each vMeme is appropriate to the conditions of time and place. Although they emerge in a particular order, their strength can vary, brightening and dimming as these life conditions change. However, it must be mentioned that while vMemes express both healthy and unhealthy qualities, vMemes themselves are neither good nor bad, neither healthy nor unhealthy, neither positive nor negative.

Within the first-tier that Graves observed, the first vMeme was designated Beige by Beck and Cowan. It is the basic survival level, valuing food, water, warmth and safety above all else. It is characteristic of early humans and newborn infants. The Purple vMeme is characterised by animistic thinking, magical beliefs and is common in tribal environments and the Hogwarts School of Harry Potter stories. Kinship is important and powerful spirits rule the physical world. Beyond Purple lies Red, whose thinking is egocentric. There is a belief in the world as a jungle full of threats and predators. It is impulsive, valuing power and thus it employs exploitative processes often in the pursuit of imperial social structures (pp.44-45).

With the emergence of the Blue vMeme, the thinking becomes absolutistic. Processes are authoritarian in nature. Highest value is placed on order, righteousness and stability. Although fundamentalist religions thrive under this vMeme, it was also responsible for legal and moral systems with an emphasis on retribution (pp. 44, 46). The Orange vMeme became dominant during the Western enlightenment. It values success, rationality and science. It is multiplistic in its thinking and in contrast to its predecessor, more delegative than rigidly authoritarian. Competition, strategic risk-taking and the efficient utilisation of resources are also highly valued. The final vMeme within the first-tier, designated Green, is described as communitarian, egalitarian and pluralistic. The thinking is relativistic and the favoured type of process is consensual. Sensitivity is valued over rationality, diversity over dogma, kindness over kinship, plurality over power (pp. 44, 46).

Significantly, Graves discovered vMemes beyond the first, “subsistence” tier. The “momentous leap” he referred to in the title of his 1974 paper is one in which humans cross “a chasm of unbelievable depth of meaning” (p. 75). Within this second (“being”) tier, Beck and Cowan have documented two levels so far, Yellow and Turquoise, which together they feel are representative of no more than 1% of the human population. Wilber (2000a) describes Yellow as “integrative,” able to grasp natural holarchies. Knowledge and competence is valued over rank, power, status, or group and egalitarianism is complemented with natural degrees of excellence where appropriate (p. 52). Turquoise thinking is global, viewing the world as a single, dynamic entity, sensitive to the deep inter-connectedness of all things, as well as collective mind and intuitive thinking. Beck and Cowan point to both James Lovelock’s Gaia hypothesis and Gandhi’s ideas of pluralistic harmony as examples (p. 47).

vMemes emerge in individual and collective thinking in response to life conditions. More complex problems and challenges initiate the process through which the higher, more complex vMemes emerge. However, each vMeme has its purpose and its time. Orange thinking can solve Orange problems, just as Green thinking can solve Green problems. A naughty toddler is a Blue problem requiring a healthy Blue approach (boundary setting and discipline) rather than an unhealthy Blue approach (violence) or, say, an Orange approach (bribery) or a Green approach (let junior explore his/her feelings of anger). More complex value systems (like Green) are capable of solving more complex problems, but don’t do so well with less complex ones.

A key insight of Spiral Dynamics theory, as Wilber explains it, is the observation that humans whose values and thinking are rooted within the first-tier are often convinced their own values are the “correct ones” for everyone. Whereas second-tier thinking can step back and grasp the big picture, appreciating the necessary role that all of the various vMemes play, first-tier thinking (of any colour) often reacts negatively if challenged and lashes out when threatened using its own tools and strengths (Wilber, 2000a, p. 51). A clue to why this is so may be found in Graves’ own words. He describes the gap between the first and second-tier as that “between deficiency or deficit motivation and growth or abundance motivation.” (Graves, 1974, p. 75)

Although Spiral Dynamics is concerned with only value systems (vMemes), the psychosocial implications are significant, particularly in the peace and conflict domain. It is, however, a subordinate theory to Wilber's, because it does not address the perspectives represented by the four quadrants, nor does it theorise about other human capacities. Together, though, the integral model and Spiral Dynamics provide a framework for analysing all types of theory and practice. The next two sections demonstrate how this can be done within peace theory and peacebuilding. Far from being mere esoteric, philosophical schemas, these forthcoming sections show how these ideas can be made operational and relevant.

Section Two: John Burton and Human Needs Theory

Section one introduced the key elements of Wilber's integral model that I consider of most relevance to an exploration of peace and conflict theory. This section examines an application of Wilber to the ideas of John W. Burton, exploring both theoretical underpinnings and practical applications. First, the extent to which Wilber's four quadrants are being honoured in Burton's work is explored. This includes a search for any possible reductionism of one quadrant to another. Second, the degree to which Burton preferences one development line over another is determined and the implications of this discussed in terms of how it weakens the problem-solving approach. Finally, an examination of the values evident in Burton's framing of human needs theory and in the problem-solving workshop he advocates is undertaken. Are these values made explicit? What vMeme best characterises his work?

Burton's Key Theoretical Ideas: What Motivates Behaviour

During Burton's many years in international diplomacy, he observed that most efforts to create peace were limited to conflict settlement based on coercion, control and power politics. He concluded that such efforts ultimately fail because of the existence of frustrations and concerns under the surface that were not negotiable and could not be repressed (Burton, 1990, p. 13). Thus, he advocated a process of conflict resolution, which is concerned with root causes, uses a clearly articulated analytical approach and has at its core, human needs theory (Burton, 1990, p. 187).

Human needs theory asserts that it is the frustration of ontological, mostly non-material, human needs that is the major cause of deep-rooted violent conflict. Burton and Sandole (1986) accept those needs as articulated by Paul Sites: response, security, recognition, distributive justice, meaning, rationality and control (p. 338). To Sites' list, Burton (1979) added role defence – the defence of positional goods (pp. 140-156). Unlike material needs, the means for satisfying non-material needs (except role defence) are not necessarily in short supply. While these needs are not subject to negotiation and bargaining, their satisfaction amongst one party can in fact promote their satisfaction in others (Burton, 1990, p. 242). The key lies in finding appropriate satisfiers that achieve this win-win scenario. Sites argues that human needs are grounded in human emotions. He points to Kemper's research concerning the four primary human emotions - fear, anger, depression and satisfaction. Sites (1990) explains how humans strive to avoid suffering caused by negative emotions and move towards enhancing the possibility of satisfaction. All of which is also necessary for healthy survival (p. 16).

Human needs theory challenges the traditional, power political view articulated by authors such as Hans Morganthau (as cited in Burton, 1997, p. 18). This view assumes that the roots of conflict lie in humans' natural aggression, their use of this aggression to protect material needs and holds the individual responsible for being evil or unsocialised (Burton, 1990, p. 31). Moreover, it concludes that authoritative power at all levels is the foundation for peace, domestically and internationally (Burton, 1990, p. 31). In order to achieve these goals, it sanctions the use of punishment for any failure to comply in an attempt to ensure future conformity (Burton, 1997, p. 23). This is underpinned by an assumption that behaviour is to a large degree, malleable and therefore humans are wholly capable of being socialised in the manner that authorities deem to be necessary (Burton, 1997, p. 20). This traditional view is responsible for structural systems such as slavery, feudalism, tribal elite rule, majority tribe rule and modifications of these as industrialization developed (Burton and Sandole, 1986, p. 336).

Burton (1997) rejects all of these assumptions. He explains how such approaches are simply ineffective in the modern era and are likely to lead only to more frustration, alienation, anger and social unrest at all levels (p. 11). Burton (1990) believes that the traditional view leads authorities to wrongly conclude that extreme aggressive behaviour must be controlled through power and coercion in order to protect their social systems (p. 241). He argues that ultimately the fault lies with social norms and institutions, which he insists must be adapted to human aspirations and not the other way around (Burton, 1997, p. 26). He concludes that deep-rooted conflict is a problem, not necessarily of the type of socio-political system (e.g. communism, capitalism, fascism etc.) but of the processes within those systems. Specifically, this includes decision-making, goal setting and how decisions are pursued (Burton, 1990, p. 265). The adversarial political process and the protection of elite interests loom large in his critique. For Burton (1990), coercion fails because of the existence of those behaviours that cannot be altered by socialization processes (p. 4).

Burton (1997) advocates holism as part of his philosophy. His critique of the social sciences includes a concern that the whole person has not previously been the subject of study (pp. 20-21). Attributing this in large part to the separation of knowledge into distinct disciplines over one hundred years ago, he uses the analogy of medical specialists and their inability to treat the whole person effectively. Conflict Resolution, according to Burton and Sandole (1986), should be an adisciplinary study that cuts across all disciplines: a synthesis, a holistic approach to a problem area (p. 333). Burton (1997) defines holism as a philosophy that “recognizes that the whole is greater than, and therefore different from, the sum of its parts” (pp. 127). He further explains that holism requires that we challenge assumptions, address root causes of social problems, use deductive techniques based on theories (particularly those of human behaviour) and find ways to cut across culture and ideology.

The major practical application of Burton’s theories lies in his problem-solving workshop. This analytical, facilitated process has the aim that participants will agree to change their tactics by selecting from many options those satisfiers that are not a threat to others. The assumption is that these options will emerge once relationships have been analysed, perspectives of the other understood and costing of alternatives conducted (Burton, 1990, p. 205). Facilitators need to be experts in human behaviour. They assist participants to learn more about both their conflictual relationships and the cause-and-effect relationship between behaviour and perception. It is clear that their key skills involve analytical and strategic thinking. There is no indication that the process would involve any sort of affective sharing, discussion of meaning and intent, or any direct understanding of culture.

Burton’s writings are striking in that they contain very few references to culture. Although he does define culture on more than one occasion, those definitions lack any acknowledgement of collective meaning, as will be discussed in section four.[4] Furthermore, his attempt to make a distinction between “culture” and “cultural values” leaves the reader confused. This is of concern because cultural values are held up as of some importance in the problem-solving process. Burton (1990) concludes that culture is “not an important consideration in a facilitated analytical problem-solving conflict resolution process” (p. 215). He reasons that because many deep-rooted conflicts have a cultural dimension, the problem-solving process must be capable of cutting across all cultures and so it must ultimately be culturally neutral. Having reminded us that many cultural norms with respect to dealing with conflict are often themselves dysfunctional (p. 214), he observes what he considers a tendency to give culture a special status in either analysis or process in ways that are “not relevant and probably dysfunctional” (p. 211).

Burton makes a distinction between human needs, cultural values and culture itself, outlining a hierarchy, from most to least important. However, his distinction between the last two of these is hard to pin down. In Burton (1990), he refers to culture as the concepts, habits, skills and manners of a given people at a given period of development (p. 212). Values are described as the ideas, habits, customs and beliefs that are a characteristic of particular social communities (Burton, 1990, p. 37). Yet in Burton (1996), he simply refers to culture as the total range of activities and ideas of a people including their means of dealing with disputes and conflicts (p. 22). Values (cultural or otherwise) are not explicitly mentioned. In Burton’s last book, where his reasons for the primacy of human needs are most explicit, he reiterates that human needs represent goals or objectives that are universal and unchanging, whereas culture is to be grouped together with other sorts of “preconceptions” thus representing only a difference in method and means to those needs (Burton, 1997, p. 130). He describes culture and its associated values as “tactics,” ways of satisfying specific goals. Burton (1990) says, for example, that the pursuit of culture is a satisfier of the need for identity and recognition (p. 211) and defence of cultural values is a means of satisfying the human need for personal security and identity (p. 37).

Yet for Burton, values have a greater significance than culture. While still holding that they are a set of acquired behaviours that are subject to change and not held universally, he describes them as only partially negotiable (Burton, 1990, p. 244). In almost all cases, he places them together with needs/goals as the set of things that problem-solving ought to try and satisfy. Of particular concern is Burton’s indictment of culture as justification for behaviour or habits seeking to hide behind ethnicity or sub-group membership. He writes, for example, about UN diplomats being late to meetings and the Middle-Eastern penchant for sleeping after lunch and questions the existence (or validity) of sub-cultures (Burton, 1990, p. 212).

Burton under Wilber’s Microscope: Culture Serving Human Needs and the Orange vMeme

Burton’s advocacy of holism echoes to some extent Wilber’s larger critique of modernity. As Wilber (2000a) explains it, modernity’s great gift is its necessary differentiation of what Max Weber and Jurgen Habermas called the “value spheres” represented by arts, morals and science

---

[4] See, for example, Clark, 1990, pp. 34-59, and Staub, 1989.

(pp. 60). This is evident in the way science and art were disentangled from religion during the enlightenment, allowing both to pursue their own truths, make profound discoveries and flourish without offending prevailing dogma and suffering censorship, and without their exponents fearing imprisonment or death. However, Wilber's critique of modernity is that these "value spheres" did not just peacefully separate; they often flew apart, leading to dissociation, fragmentation and alienation (Wilber, 2000a, pp. 61). A similar fragmentation and alienation is of concern to Burton, particularly as it applies to academia and the various disciplines, which he feels, ought to be brought together in order to create a holistic approach to the problem of violent conflict. However, although Burton envisions conflict resolution as cutting across and transcending disciplines, it is important to note that the type of holism he suggests does not include the subjective domains, such as culture. This, then, is a limited holism because as Wilber (2000a) reiterates, holism must be based on the principle of "transcend and include" (p. 51 and pp. 150-151 at note 3). Burton seeks to transcend disciplines, but not include those that honour the distinct truths of culture.

I would also argue that Burton's writings on culture, limited as they are, demonstrate the reduction of the lower-left (cultural) quadrant to the upper-right (behavioural) quadrant. Alternatively, it could be argued that Burton's view of culture acting as a satisfier of human needs reduces culture instead to the upper-left (intentional) quadrant, based on Sites' argument that the roots of human needs are largely found there. In both cases, this is what Wilber calls subtle reductionism. Wilber (2000b) explicitly warns about subtle reductionism, one form of which occurs when the whole validity of a cultural set of values is converted into a question of whether they promote social cohesion, functional fitness and the integration of the social action system (p. 152). Most significantly, there is no mention in Burton of the concept of culture as collective meaning. The word "meaning" makes no appearance in a slim, six-page section dedicated to the topic, other than as a synonym for "definition" (Burton, 1990, pp. 211-216). Let us remember that Wilber characterises the left-hand quadrants as being concerned with the question "what does it mean?" as opposed to the right-hand, concerned with the question "what does it do?" It is ironic, therefore, that one of the non-material human needs that Burton subscribes to is the need for meaning.

Nevertheless, Burton's explanation of deep-rooted conflict represents a significant shift in thinking away from the traditional, power-political model. This shift engages the discipline of psychology in a more sophisticated way and thus brings the upper-right (behavioural) quadrant into the foreground of thinking on conflict. At the same time, it provides a deeper analysis of the social domain (lower-right quadrant) by rooting a major cause of conflict in structural violence, as defined by Johan Galtung (1969, pp. 167-91), the origins of which, according to Burton (, 1997), lie in the policy and administrative decisions that are made by some and which adversely affect others (p. 32). I also conclude that the upper-left (intentional) quadrant is being considered in Burton's explanation of conflict, albeit indirectly. As Sites explained, intentionality underpins human needs through the existence of universal emotions and drives. Nevertheless, Burton's problem-solving workshop aims only at objective change. The problem-solving approach itself is firmly situated in the right-hand quadrants of the AQAL model. This raises the specific concern that emotion, attitude, direct personal experience, values and meaning may be more causally significant, and have a greater role to play in the set of potential solutions to conflict, than Burton envisions.

In section one, we recall that the AQAL model proposes that human development in the left-hand quadrants is characterised by a set of distinct but inter-dependant capacities. These capacities exhibit a general progression, albeit not always in a linear or predictable way, over the lifetimes of individuals and cultures. The cognitive line in the upper-left quadrant is crucial. Wilber (2007) suggests cognitive development is “necessary but not sufficient” for growth in many other lines (p. 65). Burton’s problem-solving approach relies heavily on these cognitive skills. This is evident, for example, in the way that participants in that process are obligated to be analytical and to cost out the consequences of policies and options (Burton, 1990, p. 271).

Of course, there is no reason to doubt Burton (1990) when he asserts that skills of analysis and thought are common to the human species and cut across cultures and levels of education (p. 214). However, an integral analysis raises the concern about the preferred way of thinking and evaluating costs (and therefore value). Individuals, as a result of either their personal experience or the influence of their culture, may have vastly different world-views or value systems. This leads to a wide variation in the value they place and level of comfort they have in the rational costing demanded by Burton’s workshops. For example, using Beck and Cowans vMeme language, we learn that Blue (Authoritarian) vMeme thinking values a rational, analytical approach only insofar as it does not threaten accepted “truths.” Costing from a Blue perspective places a high value on preservation of traditional ways. In contrast, the Red (Exploitative) vMeme costs the loss of power quite differently to someone whose thinking is centred on the Green (Communitarian) vMeme. Efficiency is of utmost value to Orange (Entrepreneurial) vMeme thinking. Individuals with Purple (Tribal) vMeme thinking will struggle to be understood by those centred on the Orange vMeme and more likely to be viewed as superstitious and pre-modern. Differences such as these raise a number of issues. Burton maintains that ontological human needs “cut across” culture and trump values. Perhaps not. If culture, values and associated world-views are the lenses through which people understand their world, make judgements and define meaning, how is this to be filtered out when diverse people sit down to find their common goals? And how are institutions and governments to formulate policy and processes in light of this diversity of value amongst their populations?

Burton’s problem-solving approach has emerged in a global context that is strongly in the embrace of the Orange (Entrepreneurial) vMeme. It is entirely natural, therefore, that such values are reflected in the approach and particularly in the way it places pre-eminent value on rationality, analysis and outcomes. This also explains why Burton’s ideas are particularly comfortable to Western readers, academics and peace-workers, given that Orange values are stronger in this readership at this time. At the same time, I think it is clear that Burton emphatically rejects Blue (Authoritarian) vMeme approaches that support power politics and coercion as a means of controlling conflict, going to great lengths to explain the failure of this approach throughout his writings. I would argue that his critique of Blue is Orange in its thinking. This is particularly evident in the way he holds that the alternative, conflict resolution approach must find its own justification in terms of efficiency and acceptability to authorities (Burton, 1990, p. 172).

Nevertheless, an ever-increasing proportion of the human population are embracing the Green (Communitarian) vMeme, arguably since the 1960s and particularly so in the developed world (Beck and Cowan, 1996, pp. 303-320). It is not clear to what extent Burton reflects these emerging Green values. Certainly, his writings are peppered with mention of social exclusion and the omni-presence of inequality in social systems (e.g., “In industrial relations employees still demand to be treated as people” Burton, 1997, p. 24). However, there are few appeals to human rights and appeals to justice are avoided, even pushed aside, in favour of practical concerns for unfavourable social consequences (Burton, 1997, p. 23).

The Burtonian approach aspires to the objectivity of values neutrality. Facilitators engaged in problem-solving are seen as neutral, required to avoid making judgements or to impose their own values or wills and must, in Burton’s (1990) view avoid relating alternate perspectives that do not relate to the participants' values and experiences (p. 207). In reality, this must be difficult to achieve as facilitators, according to the analysis above, are likely to bring their own Orange values to their work. In stark contrast, the analysis of Lederach’s ideas using Wilber’s model in the next section finds a very different attitude towards the role of subjectivity and the awareness of values in peace work, shaped in large part by social constructionism. Furthermore, the prominent role of culture in Lederach’s writings indicates a very different balance between Wilber’s four quadrants. It also allows us to consider what a second-tier value approach to peace studies might look like, as opposed to Burton's first-tier values approach.

Section Three: John Paul Lederach and Conflict Transformation

In the previous section, I examined the theories and practical applications of Burton’s work and then used the AQAL model to explore aspects of that work. The degree of holism evident was found to be limited, according to the AQAL model, because, although Burton incorporates behavioural factors (Wilber’s upper-right quadrant), the subjective quadrants, particularly the cultural (lower-left) quadrant was reduced to objective behavioural factors. Wilber’s Integral map highlights the need to consider the full spectrum of human capacities (“development lines”). It was found that Burton’s problem-solving process limits its engagement of these capacities primarily to the cognitive, rational and analytical. Finally, the value system (“vMeme”) employed by Burton was, under Beck and Cowan’s Spiral Dynamics schema, predominately Orange – entrepreneurial, achievement-oriented, rationalistic. Supposed value-neutrality in the problem-solving process was called into question. This section will conduct an analysis of the work of Lederach. In particular, I explore his ideas related to conflict training, his integrated framework and his understanding of the emerging conflict transformation approach to peacebuilding.

Lederach’s Key Theoretical Ideas: Eliciting Culture, Constructionism and Embracing Complexity

John Paul Lederach’s writings reveal three factors that strongly shape his philosophy to peace and conflict. First, his upbringing as an American Mennonite. As he explains:

> This perspective understands peace as embedded in justice. It emphasizes the importance of building right relationships and social structures through a radical respect for human rights and life. It advocates nonviolence as a way of life and work. (Lederach, 2003, p. 4)

Second, his writings reveal a willingness to include the spiritual domain within the set of components that constitute his “integrated approach” to peacebuilding. Third, Lederach (1997) explains that he is an advocate of the social constructionist school when it comes to understanding conflict. For him the construction of social meaning, as an intersubjective process, lies at the heart of how human conflict is created. This view suggests that people act on the basis of the meaning attributed to actions and events and that social conflict emerges on the basis of these meanings (pp. 8-10).

Like Burton, he criticizes the traditional model of diplomacy that focuses on what are called substantive interests only. Lederach (1997) highlights the psychosocial aspects of conflict and like Burton, explains that when threatened, people seek security in narrower, more localized identity groups (pp. 17-18). While confirming the importance of unmet human needs he also recognizes the structural, economic and socio-political causes of conflict, which of course can also be framed in terms of human needs (Lederach, 2003, p. 25). However, he differentiates himself from Burton when he asserts that the emotive, perceptual, social-psychological and spiritual dimensions are core, not peripheral, concerns (Lederach, 1997, p.29).

Lederach argues for conflict transformation as a movement amongst peace theorists and practitioners. In contrast to conflict resolution, which Lederach (2003) sees as being too narrow, conflict transformation recognises conflict as a natural part of human affairs that can be used as a catalyst for growth in human relationships, rather than simply a problem to be solved (p. 15). This perspective owes a lot to the long-term view of conflict, as outlined by Adam Curle in 1971 (as cited in Lederach, 1997, pp. 64-66). As Lederach explains, Curle suggested that conflicts progress through some typical stages. Often beginning as latent, where power is imbalanced, transformation occurs through education, which raises awareness of this imbalance. Later, advocacy is required to assist those demanding change in the name of justice and this usually leads to confrontation. At this point, when power is more balanced and an awareness of interdependence often emerges, negotiation and mediation can occur. Of course, things are rarely this neat and, much like the progression of vMemes, conflicts can cycle back and forth and be stalled by blockages of various sorts. This perspective helps us understand not only that conflict is a dynamic, transforming process, but also that peace is itself a “process-structure.” By this, Lederach (2003) means it is a structure that is embedded in a dynamic, adaptive process that continuously evolves and develops the quality of relationships in it (p. 20). Thus, the conflict transformation process is envisioned in two directions. We can describe how conflict transforms relationships and structures and we can prescribe how our actions could impact conflict so as to produce a desired transformation. Lederach (2003) explains that these impacts occur in four domains - personally, relationally, structurally and culturally (p. 23).

Lederach (2003) contends that rather than choosing between the need to address episodes of conflict and the need to build long-term structures for sustainable peace, we need to see how those episodes can be used as an opportunity to address the epicentre of conflict (p. 33). This leads to an appreciation of multiple activities in peacebuilding, conducted over multiple time–frames and involving multiple roles. Lederach’s interdependence model (Lederach, 2005, p. 79) further explains that each side in a conflict has a “vertical capacity,” that is, three levels of leadership - high-level or official leadership, community or mid-level, and grass-roots). A common problem is that these levels are often not well connected, undertake activities that are not coordinated, or simply not in the habit of talking to each other. This “interdependence gap” is less well recognised than the need for dialogue and understanding horizontally across the dividing lines of conflict (Lederach, 1999, pp. 29-30).

Lederach feels the focus of peace-building activity should be on the middle-level leaders and actors. In formulating his “integrated approach” to conflict, Lederach (1997) explains that these actors have the greatest potential because they are the most likely to be able to build relationships, both vertically and horizontally (p. 81). The major peacebuilding activities that focus on this level are: problem-solving workshops, conflict resolution training and peace commissions (Lederach, 1997, pp. 45-47). Lederach explains further that in creating the “integrated approach” he became aware of the need to design social change in units of decades, linking crisis management and the long-term. This, in turn, requires us to understand that issues have systemic roots and so we must develop approaches that anchor issues in relationships and sub-systems (Lederach, 1997, p. 81).

In *Preparing for Peace (1995)*, Lederach explains that he was for many years an advocate of what he calls the “prescriptive” approach to training people, particularly in places outside North America. This involved the transfer of techniques considered universal and culturally neutral (pp. 65-66). Cultural differences were an aspect of advanced training, in which practitioners learned how to adjust those techniques to employ the necessary level of sensitivity such differences demanded (pp. 5-6). In time, Lederach became aware that a participant’s own culture, rather than being irrelevant or a challenge to overcome, was a powerful resource. He saw how this knowledge, which included an understanding of what things mean, could be used to help identify needs in context (pp. 56-58). Appropriate training models could then be derived to generate more sustainable peace processes. The key was that by eliciting the insights of this local cultural knowledge, including myths, relationships and language, a more adaptive, long-term platform for generating solutions could be built. Nevertheless, he stopped short of just rejecting the prescriptive approach; instead he developed the conviction “that a convergence of universal and particular with prescriptive and elicitive [processes] was both possible and necessary” (p. 92).

He continued his critique of the prescriptive approach to training in *Building Peace (1997)*. Echoing some of the findings in Section Two of this dissertation, Lederach observed that prescriptive approaches were focussed primarily on the cognitive skills of analysing conflict and the communicative skills of negotiation, with very little recognition of either the “cultural baggage” of these approaches nor the value of local knowledge as a resource (p. 107). As explained above, Lederach does not totally reject the conflict resolution approaches with its problem-solving workshop, as advocated by Burton. He accepts that it does provide a degree of empowerment to those being trained, by presenting concrete ideas which may contain new ways of thinking and specific skills (Lederach, 1995, p. 51). More generally, the conflict transformation approach has a distinct advantage, according to Lederach, due to its capacity to consider multiple avenues of response. At its heart, it incorporates the conflict resolution response; but a narrowly defined conflict resolution approach, according to Lederach, can’t raise the questions that conflict transformation can and therefore does not contain the potential for broader change (Lederach, 2003, p. 68). He does admit, however, that conflict transformation is of limited value when there is no ongoing relationship between the conflicting parties (p. 69).

All of this reflects Lederach’s general rejection of simple either/or solutions and his insistence that peacebuilders must develop the practice of embracing complexity and dilemma. Abiding complexity, he says, requires that we develop the capacity to identify the key energies in a situation and hold them up together as interdependent goals (Lederach, 2003, p. 52). In a section dedicated to the topic of complexity and simplicity in his book, *The Moral Imagination (2005)*, Lederach explains the role of a paradoxical curiosity in enabling one to rise above dualistic polarities (pp. 31-40). Such a curiosity allows one to suspend immediate judgement, accepting things both at face value and at what he calls “heart value” (the way things are perceived and interpreted; the “home of meaning”). Ultimately this allows us to find a greater whole, a greater truth than could otherwise be perceived (pp. 36-37). This greater truth may indeed represent a type of simplicity, a simplicity beyond conventional understanding, not prior to it. Lederach quotes Oliver Wendell Holmes at the start of this section:

> I would not give a fig for the simplicity this side of complexity,
> But I would give my life for the simplicity on the other side of complexity.
> (Oliver Wendell Holmes, quoted in Lederach, 2005, p. 31)

Lederach under Wilber’s Microscope: Subjective Meaning and the Yellow vMeme

As we recall from Section One, Wilber’s AQAL model calls attention to the existence of four separate but interdependent domains, each encompassing particular ways of knowing and understanding that cannot be reduced to another. In the analysis below, I begin by outlining the extent to which Lederach acknowledges and incorporates the truth claims of each of these quadrants. Are there signs of reductionism? Does one or more of the quadrants dominate his theories and practice? I then examine the values evident in Lederach’s work, identifying the nature of any shifts in his value system, as they would be understood by Beck and Cowan’s Spiral Dynamics schema. The implications of such shifts are also examined.

Lederach’s active spirituality and his espousal of social constructionism set him apart from Burton and other peace scholars. These two factors together indicate an inclination towards Wilber’s left-hand (subjective and meaning) quadrants. This is certainly reflected in Lederch’s comments about the central role of emotive, perceptual, social-psychological and spiritual dimensions in the process of reconciliation. Furthermore, conflict resolution as Lederach (1997) points out, has traditionally seen such factors as irrelevant or outside the competency of international diplomats (p. 29). While the socio-psychological dimensions Lederach alludes to are many of the same that concern Burton, straddling both the upper-right (behavioural) and upper-left (intentional) quadrants of the AQAL model, the spiritual and emotive issues Lederach points to are directly concerned with personal subjectivity. This shows a more direct consideration of the upper-left quadrant than Burton’s writings.

But what of this social constructionism? We recall that Wilber is equally critical of both extreme materialists and extreme social constructivists, as discussed in Section One. However, Lederach avoids such critiques because his advocacy of social constructionism (which is closely related to constructivism) does not deny objectivity and its truth claims. I find no evidence of either subtle or gross reductionism in any of his books. Recall also the four domains Lederach (1997) articulated - personal, relational, structural and cultural (p. 82). These domains correspond very closely to Wilber’s four quadrants. The personal domain maps to the upper (individual) quadrants; the relational one maps to the lower quadrants, in large part to the inter-subjective (lower-left); the structural is the lower-right (social) quadrant and its socio-political structures; and the cultural one is precisely the lower-left quadrant.

Lederach's later books, such as *The Moral Imagination (2005)* suggest a similar understanding to that of Wilber's major critiques of modernity. This critique, mentioned in Section Two, concerns the fragmentation of the three spheres of values symbolically found in the arts, morals and science. These spheres are in fact a reframing of the Four Quadrants: arts represent the "I" or subjective (upper-left), morals represents the inter-subjective or "WE" (lower-left) and science corresponds to both the objective quadrants – upper-right and lower-right (Wilber, 2001, p. 18). Although Burton identified the fragmentation of specialisation in modern science and academia, Lederach goes further and takes active steps to incorporate morals (cultural meaning) and art (personal meaning) into peacebuilding practice. Lederach (2005) introduces the novel idea of the aesthetics of social change. He expresses concern that by shifting perspective towards the technical and away from the artistic, peacebuilding processes have become too rigid and fragile. He posits that only by rediscovering the artist's intuition can we get to the "art and soul of the matter" (p.73).

Although Lederach avoids reductionism, can we conclude that his approach is "all quadrant"? Probably, but with some caution. Unlike Burton, who advocates for the bulk of action in the quadrants of objective change, it could be argued that Lederach's strong engagement with the subjective and inter-subjective may over-emphasize skills concerned with relationships, empathy and intuitive breakthroughs. It is possible that Burton's socio-political concerns could be pushed to the background too much in Lederach's schema. Lederach's particular balance may be more appropriate to specific sorts of conflict situations – recall that he himself admits the limited value of conflict transformation when ongoing relationships are not involved. As explained in Section One, Wilber's schema doesn't prescribe absolute equality, only that an appropriate awareness of the dimensions each of the quadrants represents. The degree of complexity and nature if the conflict should determine the balance.

Unlike Burton, who freely acknowledged that cognitive ability was the essential skill required by problem-solving conflict resolution, Lederach's later works question whether this ability is ever sufficient to the greater goal of sustainable peacebuilding. As discussed in Section One, Wilber considers the cognitive line to be just one of a set of separate and inter-dependent human capacities, each with its own growth potential. Lederach (2005) concludes that while current skills training is oriented towards understanding cognitive and behavioural responses in human interaction, there is a strong need to tap other parts of human "being" and "knowing" (p. 175). To this end, he encourages the disciplines of a wide range of the arts, such as journaling, storytelling, poetry, drawing, painting and music. Having incorporated such practices in his own workshops, he is convinced that their value to designing peacebuilding platforms lies not in the products produced, but in the way they unlock creativity and "the moral imagination." Ultimately, he says, they help penetrate complexity with breakthrough insights and nurture attentiveness to intuition (Lederach. 2005, p. 174).

So what does all this suggest about Lederach's values, at least insofar as they are disclosed in his writings? This is where the Spiral Dynamics of Beck and Cowan, as explained in Section One, are helpful. It seems that Lederach has himself progressed through various vMemes. While Blue (Authoritarian) values, such as right authority, sacrifice, rule of law, are not a feature of even his early writing, in his early career he practiced a strongly prescriptive approach to training and this indicates some degree of the Orange (Entrepreneurial) vMeme in its espousal of the universality of rationality. This approach employs a transfer mentality to education (Lederach, *1995*, p. 28) – the teacher is the expert, the student is passive - and is driven by the goal of transferring universal knowledge and skills to other settings. Lederach's discovery of theorists like Paulo Freire and his concept of conscientization (i.e., awareness of self in context) resonates strongly with his inclination towards social constructionism (Lederach, 1995, p. 19). These ideas find their zenith within a more complex and contextualised Green (Communitarian) way of thinking. Although how and when these ideas first infused Lederach's thinking is unclear, it is likely that his socially engaged Mennonite upbringing would have given him the capacity for activating a Green value system.

Significantly, Lederach may have begun, if not completed, the journey to a second-tier vMeme approach. Lederach (2003) suggested the practice of developing the capacity to pose the energies of conflict as dilemmas or paradoxes (pp. 51-52). He also asserts that we must "make complexity a friend, not a foe" (p. 53) because it provides multiple options. The key, he says, is to trust that options will be generated, pursue the most promising but not lock rigidly to one idea (p. 54). These are characteristically "second-tier" vMeme attitudes. The end of Lederach's 2005 book contains four mottos that encapsulate much of his writing to that point:

> Reach out to those you fear.
> Touch the heart of complexity.
> Imagine beyond what is seen.
> Risk vulnerability one step at a time. (Lederach, 2005, p. 177)

Psychologist Dr. Clare Graves, whose seminal work underpins Beck and Cowan's Spiral Dynamics, characterised the second-tier of vMemes as crossing a threshold beyond which fear dropped away -- fear of death, fear of God, fear of technology and fear of fellow humans (Graves, 1974). Beck and Cowan (1996) echo this and add that this helps develop an ability to take a contemplative attitude, with the result that the quantity and quality of good ideas increases dramatically (p. 278). In the transition to second-tier vMemes, ideas become multidimensional. Yellow (Systemic) thinkers, for example, tolerate and even enjoy, paradoxes and uncertainties and are neither intimidated nor cavalier in the face of complexity (Beck and Cowan, 1996, pp. 276-278). An ability to resolve such paradoxes is mentioned as one of the two key competencies of the Yellow problem-solver. The other is related to their comfort, even enthusiasm, for seeking out that complexity. Not only are they drawn to hot spots where evolving crises demand new insights, they have an ability to smooth out blockages between people with different vMeme thinking (Beck and Cowan, 1996, p. 283).

Based on vMeme theory, I suggest there are at least three implications if Lederach is developing a second-tier vMeme capacity. First, his proposals could signal the leading edge of a transformation in peacebuilding. The shape of this is explored in more detail in Section Four. Secondly, Lederach's work may challenge and risk alienating some readers and participants for whom its eclectic synthesis of diverse ideas are either incomprehensible or seem to lack a well-defined core idea. Beck and Cowan suggest this is often the case when those centred on first-tier vMeme thinking encounter the second-tier. For example, to those at Blue (Authoritarian), those at Yellow (Systemic) appear inconsistent, disrespectful and out-of-focus. To Orange (Entrepreneurial), Yellow seem unwilling to commit themselves fully to achieving objectives. From the Green (Communitarian) standpoint, they seem cool and reserved, intellectualising emotions without joining wholeheartedly into the group experience (Beck and Cowan, 1996, p. 282).

Third, Yellow vMeme approaches are rare, both in academic disciplines and the general community, even 40 years after Clare Graves identified their existence. Second-tier vMeme approaches require second-tier actors to emerge and shepherd them into existence. The estimate of persons at second-tier is only 1% of the population (Beck & Cowan, 1996). Given this, I suggest that the transformational social change which they might be able to bring about will require these actors to be distributed strategically throughout society, in a manner constituting the “critical yeast” that Lederach (2005) does indeed propose (pp. 87-100). This concept suggests that the quality of connections of strategic individuals and the social spaces they inhabit may be of more importance than the quantity of such individuals, an idea also found in Malcolm Gladwell’s notion of “connectors” in his popular book, *The Tipping Point (2000)* (as cited in John Paul Lederach, 2005, p. 90)**.**

Lederach’s concern with subjective causes and solutions of conflict is closer to the “all quadrant” approach Wilber advocates. In contrast to Burton’s primarily Orange (Entrepreneurial) vMeme orientation, Lederach’s probable transition to a second-tier, Yellow (Systemic) value system raises exciting possibilities about this theoretical contribution to peace and conflict study and practice. In the next section, I explore how the peace and conflict studies literature support the integral analysis of Burton and Lederach conducted herein, before sketching out some of the integrally informed scholarship now emerging in the peace and conflict studies domain.

Section Four: Towards Integral Peacebuilding

In sections two and three, Wilber’s AQAL model and Beck and Cowan’s vMeme schema was used to examine the work of the scholar-practitioners, Burton and Lederach. This section begins by outlining some of the peace and conflict literature that reflects the analysis conducted in the previous two sections of this dissertation. These reflections support the argument that Wilber’s AQAL model is a useful analytical tool, both for analysing the cause of conflict and the degree of holism of specific conflict theories. The section ends with a brief exploration of recent attempts to apply integral theory to peacebuilding and addresses the question of whether Wilber et al have provided a valuable prescriptive framework in the context of peacebuilding.

Reflections on Burton and Lederach

Avruch (1998) examines the role of culture in Burton’s problem-solving approach and observes that Burton holds culture to be relatively unimportant and so it assumes no greater role than as a “satisfier” of human needs. While for Avruch, cultural analysis is an irreducible part of the problem-solving process (p. 74), he notes that in their purest form, problem-solving panels aim to help participants “excavate right past culture” down to those human needs (p. 90). Avruch (1998) demonstrates Burton’s acute minimisation of the importance of culture by pointng out that within the highly prescriptive set of 56 rules Burton provides, culture appears on only one occasion (as cited at p. 90).

Further, Avruch questions Burton's assumptions that people everywhere reason the same way and that everyone shares the same cost-benefit calculus. Even in these areas, culture is significant. Avruch (1998) goes on to quote Lederach, whose experience in Central America highlighted the difference between analytical thinking (breaking down stories into components) and holistic thinking (keeping the parts of stories together) (p. 92). Further, Avruch cites research by James F. Hamill, who found that while syllogistic logic ("All Cretians are liars; I am a Cretian; therefore I am a liar") looks the same from culture to culture, propositional reasoning does not, because the semantic elements of the arguments mean different things in different settings. (What is a liar? If you're not a "liar," then are you always "honest"?) He adds, meaning not only structures validity but also defines truth (as cited in Avruch, 1998, p. 93). As explained in Section Two, while Burton never frames culture in terms of meaning, Wilber, in contrast, feels that meaning is the key quality of the subjective quadrants. Scholars such as Ervin Staub (1989), agree, preferring a definition of culture as the shared meanings within a group, specifically the values, rules, norms, customs and life-styles (p. 13). Similarly, Clark (1990), who argues that social bondedness is a crucial human need, suggests that this deep bondedness is based on shared values and worldviews and the sense of a people reciprocally sharing a common fate. She calls this "sacred meaning" (p. 47).

Väyrynen (1998) highlights the medical metaphors that infuse Burton's problem-solving approach. Not only are facilitators, like doctors, expert practitioners who diagnose disease and implement cures but also therapists, who, according to Burton, help participants to "filter out" false assumptions and misconceptions and therefore to perceive reality accurately (as cited Väyrynen, 1998, Purification Through Professional Cure, para, 8). Interestingly, she makes the link between his strong belief and reliance on instrumental rationality and the Enlightenment idea of the universal man who is determined to control both social and natural environments (Social Engineering and Instrumental Rationality section, para. 3). I believe there is no better description of the core values and worldview of the Orange (Entrepreneurial) vMeme than this. Väyrynen (1998) locates Burton's approach within the neobehavioural school, which she describes as based on an uncritical trust in the existence of objective scientific facts and in their value in solving practical problems. This rejection of culture and inter-subjectivity (the lower-left quadrant) is challenged by social constructionism, which asserts that cultural patterns function as unquestioned schemes of reference and condition how the world is represented to a person. As the phenomenological sociologist Alfred Schütz explains, through processes of interaction with people in the social world, we come to see things as types, which he calls "intersubjective "typifications" (as cited in Väyrynen,1998, Creating a New Reality section). These shared typifications then define common realities. The social constructionist view is that a shared reality, rather than biological human needs, is a pre-requisite for cooperation (Creating a New Reality section, para. 3). Similarly, the Spiral Dynamics' vMemes circumscribe particular ways of thinking that shape our perception of what Burton would describe as purely objective reality.

Nudler (1990), in exploring the nature of conflicts between "worlds" or "frames," comes to a similar conclusion. He notes that William James' notion of "worlds" (selective attention that makes a set of things real) (as cited on p. 177) is similar to Erving Goffman's notion of "frames," which Nudler explains as a set of assumptions or principles which enable us to structure situations and make them real for us. Both ideas are undergirded by a non-reflective, uncritical acceptance of their basic assumptions and as Michael Polanyi says, when we accept these assumptions as our interpretive framework "we may be said to dwell in them as we do our body" (as cited on pp. 178-79). This brings to mind Wilber's description of stages of development (such as vMemes). Describing the process as one of disidentification with the old and identification with the new, he adds that at each stage, the self "sees a different world: it faces new fears, has different goals, suffers new problems. It has a new set of needs, a new class of morals, a new sense of self" (Wilber, 2000a, p. 38).

Nudler (1990) proposes that the need for meaning is perhaps the most fundamental of all. He defines this "as the need which every human being has for building — and living in — a world (in the subjective sense introduced above)." (p. 187) Nudler contends that conflict resolution through problem-solving techniques has such a strong reliance on analytical skills that it is insufficient to resolve conflicts between worlds or frames. It must be complemented by other procedures, appealing to quite different abilities. The ability to discover and enter dialogue concerning what he calls the "root metaphors" underpinning a particular world or frame is suggested as one of these procedures (Nudler, 1990, pp. 188-196).

In Tom Woodhouse's article entitled 'Conflict resolution and peacekeeping: Critiques and responses' (2000), he responds to three specific critiques of conflict resolution, of which Christopher Clapham's arguments are of most interest here (as cited on pp. 9-11). Clapham's examination of the genocide in Rwanda led him to question two assumptions underlying the prevailing conflict resolution model. First, the failure to recognise the deep-seated differences that caused the conflict reveals, in his view, a "Western" assumption that parties to the process share a common value framework. Second, the assumption that mediation is inherently a good thing, being a neutral action and intended to fulfil humanitarian concerns. To this second point, the Woodhouse response is to explain the approaches of scholar-practitioners like Adam Curle and Lederach. Both acknowledge the limitations of "outsider-neutral" intervention. Curle was eventually convinced of the need to develop local peacemakers' inner resources of wisdom, courage and compassionate non-violence (as cited on p. 20). This is strongly echoed in Lederach's elicitive approach, explained in Section Three, and his discovery of the need for "insider partial" facilitators in Central America, which he wrote about as early as 1991 (as cited in Woodhouse, 2000, p. 22). As the previous sections demonstrate, neither Burton nor Lederach are values-neutral. Like all of us, their worldviews are shaped by value systems (vMemes). In Burton's case, this is not acknowledged, whereas Lederach now seeks to make his own values more explicit in his work.

The issue of worldviews or frames and as proposed here by inference value systems inherent in peace work was the subject of Rachel Goldberg's field research, described in her 2009 article, *How our worldviews shape our practice*. Using narrative and metaphor as analytical techniques, she interviewed 43 conflict resolution professionals, whom she described as pioneers and leaders in either environmental conflict or intercultural conflict. She found that most respondents showed strong, reiterated worldview patterns and from these she derived seven mini-profiles that represented the dominant focus of a particular narrative (Goldberg, 2009, p. 421 and p. 417). Having found that each respondent drew from one or more of these mini-profiles in describing their work, Goldberg was able to place these profiles on a continuum, one end labelled, *realistic*, the other *constructive.* The realistic end was connected with the idea of one, objective truth, individual interests, a belief in the universality of cultural frames; it favoured logic and empirical testing and prioritised task over relationship. The constructive end, representing the inverse, held to the relativity of "truth," focused on relationship over task, and was concerned with subjectivity. The realistic end she describes bears a strong resemblance both to the right-hand quadrants of the AQAL model and Burton's writings, while the constructive end is located in the left-hand quadrants, being closely related to social constructionism and brings to mind many of the issues prominent in Lederach's writings. Although I would place Burton very close to the far end of the realists ("The Sheriff" or "The Alchemist"), Lederach would, I suggest, be best placed somewhere between midpoint and half way towards the extreme constructive end of this continuum (mixing "The Pastor," "The Radical," and "The Family; see diagram in Goldberg, 2009, p. 419).

Goldberg (2009) frames her work by expressing concern about the hidden worldview of practitioners from mainstream cultures (i.e., middle-class North Americans) (p. 406), and in her conclusion, strongly asserts that neutrality in practice does not exist and therefore the best that we can do, and ought to do, is become self-aware of our worldviews or frames. Noting that the better practitioners, in her view, were able to move back and forth between profiles along the continuum, she points to her future work on the way our worldviews shift and how we might grow to encompass new worldviews (pp. 426-429). Such shifts, I suggest, are precisely what Beck and Cowan describe at length in their Spiral Dynamics schema, as it applies to value systems. The shift to second-tier (Yellow and beyond) vMemes is, I believe, descriptive of the more holistic peacebuilding practices. As explained in Section One, such value systems transcend *and* include the others, unleashing the type of diverse potentials Goldberg describes.

The issue of value differences amongst parties in conflict is taken up by Heidi and Guy Burgess (2006), in which they recapitulate their earlier work on the causes of intractable conflicts (pp. 179–180). Although such conflicts are based on either high-stake distribution issues (e.g. of scarce material goods) and what they call "domination conflicts" - conflicts over power, status and one's position in the social and political hierarchy – there is a third type based on fundamentally conflicting values. This research indicates that what lies at their core are issues of self-worth and moral differences. This is, arguably, a more complex issue than the issue of "outsider neutral" vs. "insider partial" facilitators and incorporates, but is not limited to, issues of cultural difference that Lederach attempts to address. It reflects the concerns in the preceding two sections about the way people cost options, decide value and worth and what they believe about their world. It is an issue better understood by social constructionists like Lederach rather than realists like Burton.

Towards an Integral Approach: How is the AQAL Map Being used Today?

There is a small body of emerging literature outlining practical applications of integral theory for those who are writing and working on peace theory and practice. One such example is provided by the Generative Change Community (GCC), an initiative connected to a private change consultancy called D3 Associates. Launched in 2005, the group is concerned with multi-stakeholder change processes in numerous areas, including conflict. Echoing many of the concerns in the introduction to this dissertation, the group aimed to increase the ability of practitioners to make wise distinctions about which tools and skills to use and when to use them within change processes (D3 Associates, 2008, p. 3). To this end, they have developed a platform for collective learning amongst practitioners. The practice, they explain is based both on Lederach's four domains of conflict transformation, described in Section Three - personally, relationally, structurally and culturally - and Wilber’s four quadrants. The technique, applied in numerous workshops, asks participants to reflect on their work within these four quadrants, which are physically drawn on the floor (see D3 article, p. 5 online here for elaboration). This is a concrete way to promote reflectivity on peacebuilding practice.

Richard McGuigan and Sylvia McMechan, at the time serving as principals of a private college called the Institute of Conflict Analysis and Management in Canada, utilise Wilber’s Four Quadrants in their Diamond Approach, which they describe as a tool of Integral quadrant analysis for organisational conflicts (McGuigan and McMechan, 2005). Motivated in large part by their concern that the frame or worldview that any consultant uses shapes their analysis, they explain, “[the] conflict exists with equivalent legitimacy in all quadrants. If solutions are derived from an integrated analysis, they are more likely to succeed because they take multiple factors into account” (p. 351). The analysis is conducted within teams experiencing conflict and asks participants to explore the factors from each of the four quadrants by asking questions as the following. "What values does the leader embrace?" "What do people need in the workplace?" "What does our organization value?" "How does our team behave?" . For example, in the upper-right quadrant – “My Behaviour” – the Diamond Approach employs Burton’s needs theory as its major analytical tool. In the upper-left quadrant – “My Leadership” – the approach focuses on self-awareness, especially as it relates to ethics and values and encourages various reflective practices as well as training in emotional intelligence and conflict resolution techniques (pp. 360-361).

Nancy Popp joins Richard McGuigan in a 2007 article in which they turn their attention to the development lines. Extolling the work of Folger and Bush, who espouse the transformational potential of the mediation process, McGuigan and Popp explore practical ways in which the constructive-developmental theory of the developmental psychologist, Robert Kegan, can be used as part of the mediation process. Kegan’s theory, as its name suggests, integrates social constructionism and development theory, both of which have featured throughout this dissertation. Challenging the assumptions that parties in mediation have equal capacity to take the other’s perspective, they provide examples of how the three adult mindsets that Kegan proposes understand and respond to conflict in very different ways (Table 1).

Table 1. Three Mindsets toward Conflict

Content	Instrumental Mindset	Affiliative Mindset	Self-Authoring Mindset
Experience of conflict	"You're wrong, I'm right, and I can't get what I want."	"You have betrayed me."	"Your world view is very different from mine."
Preferred resolution of conflict	"Everybody just follow the rules and do what they're supposed to do and obey the law"	"Let's forget our differences, concentrate on our similarities and where we agree, and join together in the same loyalty to the same side/idea/group."	"Let's come to an understanding of each other's perspective and agree to work together to the best of our ability for the benefit of all."

Note: Excerpted from McGuigan and Popp (2007), p. 234.

While those with the “instrumental” mindset are concrete thinkers with little ability to take another’s perspective, those with the “affiliative” mindset have such capacities but also have a strong group identity and strive to think and feel the same as those they have relationships with (McGuigan and Popp, 2007, pp. 225-229). These are qualitatively different ways of making meaning and require mediators to take different approaches, some of which McGuigan and Popp explore. The most complex adult mindset they discuss, the “self-authoring,” can not only take other’s perspectives, but can integrate more than one into their own, which is motivated by self-integrity, an embrace of complexity and a willingness to engage in conflict constructively (pp. 229-231). They may, however, incorrectly assume that others can and will operate as they do.

Lynn Holaday (2002) takes a very similar approach to McGuigan and Popp. Acknowledging that mediators already adapt their approach based on the parties they encounter, utilising different tools as they see fit, she believes that this unconscious approach can be made more explicit and effective by using a suitable theoretical framework for performing such an analysis. Her five stage developmental model (as shown in Holaday, 2002, p. 194) for use in mediation is adapted from various sources, including Kegan, Jean Piaget and Wilber. Holaday provides examples of tools and approaches mediators can use for clients at each of these stages, emphasizing both the behaviour to expect and the thinking and emotions underpinning the perspective. Holaday feels her approach provides mediators with a meta-perspective - a way of understanding other perspectives - as well as providing a concrete way to promote stage growth (a widening of perspective) in clients, albeit in a limited way. Mediation, she reflects, is itself a product of the higher stages, both the rationalistic (fourth) and integrative (fifth). And this gives her great hope that it can be utilised in an “all-stage” manner, to borrow from Wilber’s “AQAL” idea.

The four approaches outlined in this section provide some illustrative examples of scholars and practitioners beginning to create what Wilber (2000a) calls “integral holism” (p, 72) within the peace and conflict discipline. The need for this movement is made apparent by the critiques outlined in the first section above, which in turn provided support for the analysis of Burton and Lederach conducted in the previous two sections. The analysis in this dissertation used only integral theory and Spiral Dynamics, yet it permitted an exploration of these issues that matched the depth and breadth of those conducted by the peace scholars cited in this section.

Conclusion

This dissertation argues that Ken Wilber’s integral theory and the related Spiral Dynamics schema can be used as an analytical tool to understand the power and pitfalls of peace and conflict theory and peacebuilding practice. In sections two and three, the theories of Burton and Lederach were located within a philosophical landscape of quadrants, development lines and stages of unfolding complexity. In the process, specific critiques emerged concerning the work of these scholar-practitioners, which were then cross-referenced against the critiques of other peace theorists in the final fourth section. The congruence was significant and included:

- The minimisation of the cultural dimensions of conflict
- The limitations of purely cognitive approaches
- The questioning of the universality of rationality

- The importance of uncovering the value systems inherent in peace interventions, both those of practitioners and the parties engaged in conflict.

This not only indicates that integral theory is very useful in analytically describing the qualities of various peace theories and peacebuilding practices. I believe it also provides evidence that the more convincing theories are multi-quadrant, encompassing more than just one development line, are values-explicit and understand vMeme differences, and therefore are inherently a product of second-tier vMemes.

In order to understand why this is so, it is necessary to examine the nature of Integral theory. Recall that the AQAL model presents four, irreducible perspectives that are an inherent part of nature and consciousness. Being ever-present and ontological, they therefore infuse all human activity. Integral theory also highlights the existence of diverse human capacities in the upper-left (intentional) quadrant. These are an example of the developmental lines within each of the four quadrants and include cognition, emotions, morals, worldviews and values. The last of these is explored in particular detail by the Spiral Dynamics schema as the unfolding, stage-like progression of vMemes and is of particular interest to the values debate within peace and conflict studies. Nevertheless, I must point out that Wilber’s AQAL model is itself not values neutral. Rather, it is created from a second-tier value perspective. While it does strive to use multi-quadrant lenses, its origins in developmental structuralism provide it with a sharper focus within the upper-left quadrant, because it seeks to explain both the enduring structures of human thought (structuralism) while honouring and valuing the qualitative experience of being human (phenomenology).

Why is integral theory of prescriptive value? This question has three components. First, why is it necessary to be “all-quadrant”? Put simply, because conflict, both constructive and destructive, exists in each of the quadrants. Moreover, sustainable peace with justice is, I believe, only possible when all four quadrants are appropriately engaged. In the collective-objective quadrant (lower-right), conflict exists in the structures, institutions and power relations of society. This includes Inter-group violence and Galtung’s structural violence. At best, it is an engine for reform; at worst, it manifests as war. Peace, too, exists here. It is the peace of strong, adaptive institutions that serve human needs (as per Burton) and it is the “justpeace” (as per Lederach) of mature economies that provide prosperity and quality of life for all. In the individual-objective (upper-right) quadrant, conflict exists due to personal disempowerment, poverty, poor mental and physical health and disability. This can result in violent behaviour, which impacts on relationships. Peace in this quadrant is therefore the peace of autonomous, empowered, highly functional people able to fulfil their potential. In the collective-subjective (lower-left) quadrant, conflict exists in contested meaning, the clash of values (rather than civilisations) and Galtung’s cultural violence. At worst, it fragments society and ignites some of the worst forms of violence. At best, conflict can be the engine for diversity and growth. Peace here is either that of a pluralist, harmonious society, or else that of an autonomous, stable, monoculture. In the upper-left, the personal-subjective quadrant, conflict is existential, related to identity, ego, self-worth, emotions and worldviews. At best, conflict drives personal growth and transformation, bringing contentment and fulfilment and occasionally spawns peacemakers. At worst, personal destruction results and it occasionally spawns warmongers.

The integrally informed approaches mentioned in the last part of Section Four recognise the all-quadrant dimensions of peace and conflict (see GCC and McGuigan & McMechan articles). However, they also acknowledge the need for “all-line” and “all-stage” approaches. This is the second component of the prescriptive value of integral theory. Why is this important? Cognition, it was found, is necessary but not sufficient. Logic, Hamill explained, is not universal because what things mean depends on cultural context and can therefore become a contentious issue. Being “all-line” requires one to understand that emotions, ethics, worldviews and values complete the picture of human intentionality and therefore expand the frame that can holistically comprehend the causes of conflict. And what about “all-stage”? Being second-tier (as per Beck and Cowan) implies an ability to “transcend and include” other, first-tier values in both thinking and practice. I believe this is what McGuigan and Popp are trying to encourage within the mediation community, by pointing out the way Kegan’s mindsets explain the challenges mediators face on a day-to-day basis. Lynn Holaday’s five-stage model is very similar and her diagram of concentric circles reminds us that stage development is a process, as Wilber constantly reiterates, that both transcends *and* includes less complex stages, widening one’s circle of care and making objective what one previously held as part of one’s subjectivity.

The third and final component of the prescriptive value of integral theory lies in its framework for holism. Section one began by explaining that for Wilber, holism centres on the idea of a holon that transcends and includes less complex holons, yet is always a part of larger, more complex ones. Holarchies (hierarchies of holons) exist in all four quadrants. However, Wilber (2001) is advocating more than “exterior” holism, a holism of the Right-hand quadrants only, i.e., behavioural and social. Nor is it just “interior” holism, a holism of the Left-hand quadrants. It must include all four quadrants, thus leading to what he calls “integral holism,” one of the central aims of the integral approach (p. 16).

According to Burton, “conflict resolution deals with the total human being, encompassing personality and cultural differences, and deals with this person in the total society, encompassing system differences” (Burton, 1993, p. 29). But this is an exterior holism only (if by “encompass” he means, “transcend”). Burton’s holism does not “include” the subjectivity of culture, but instead reduces it to objective factors. In contrast, Lederach’s own “integrated approach” is as close to an integral holism this writer has yet found from a major peace and conflict theorist. However, Lederach’s holism is not merely an unstructured, “kitchen-sink” approach that includes everything within a framework in a mish-mash of perspectives. A coherent unity of perspectives requires the wise and appropriate choice of tools, interventions, mindsets and frames. If we accept there are at least three major types or causes of violent conflict, then some perspectives will be more valuable than others, depending on the mix of those three causal factors in any particular conflict. Conflicts about power, involving Red or Blue vMemes, require interventions that understand Red and Blue vMeme thinking. Conflicts about material resources require Right-hand quadrant interventions, but nevertheless benefit from an attention to any value-based issues that lurk under the surface. And when vMeme differences are the major explanation, second-tier awareness, with its comfort in complexity and embrace of integral holism, is required.

There is a tremendous opportunity for continued research. The brief summary of Wilber’s AQAL model presented in section one of this work is inadequate to convey the full depth and potential of that body of work. It only presented three of the five core components: quadrants, lines and stages, the other two – states and types – are beyond the scope of this dissertation. An opportunity for further research in this area could be to include those other two aspects of the AQAL model. In particular, personality types, which would enable an integral analysis of gender issues to be conducted. This would tap into the work of scholars with developmental roots, such as Carol Gilligan and others working towards an "integral feminism," such as Joyce Nielsen and Elizabeth Debold. Another opportunity for further research could be to conduct an integral theory analysis of other peace and conflict theorists. Johan Galtung and Betty Reardon were mentioned in the introduction. Galtung is, of course, a pioneer in peace and conflict studies and is responsible for a huge and influential body of work. Betty Reardon would provide the peace theory perspective of gender, enabling an exploration of whether and how integral feminism may be incorporated into peace and conflict studies. Finally, a more in-depth exploration of peacebuilding approaches that claim to be holistic could be conducted, whether or not they are aware of integral theory.

Although it strived to be relatively objective, the research conducted in this dissertation is necessarily shaped by the writer's subjective experience, which in turn is interpreted through a set of values. These values hold violent conflict as abhorrent, while rejecting the structural violence of oppression and marginalisation. I believe that a truly coherent unity of perspectives on peace is imminent. While I accept that this view is based more on intuition than reasoning, I contend that a "critical yeast" of self-aware, integrally informed peacebuilders will be its parents.

The Spectrum of Responses to Complex Societal Issues:
Reflections on Seven Years of Empirical Inquiry

Thomas Jordan, Pia Andersson & Helena Ringnér[1]

Abstract: This article offers conclusions and reflections based on nine empirical studies carried out over the last seven years on how increased capacity to manage complex social issues can be scaffolded. Our focus has been on the role of meaning-making structures and transformations in individual and collective efforts to skillfully manage complex issues. We have studied capacities for managing complex issues both in terms of scaffolding group efforts through structured methods and facilitation and in terms of individual skills. Our action research gave us insights into the variability in scaffolding needs: groups are different in terms of the participants' meaning-making patterns, which means that methods and facilitation techniques should be adapted to the particular conditions in each case. We discuss variables describing group differences and offer a preliminary typology of functions that may need to be scaffolded. In a second major part of the article, we report on our learning about individual societal change agency. We offer a typology of four types of societal entrepreneurship and discuss in more detail the properties of dialectical meaning-making in societal change agency.

Keywords: Change agents, complexity awareness, complex issues, dialectical meaning-making, diffusion of social innovations, facilitation, perspective awareness, scaffolding, societal entrepreneurship, wicked issues.

Introduction

Capacities to Manage Complex Societal Issues: A Meaningful Field of Inquiry

How can we – the society – become more skillful in managing complex societal issues, such as gang-related crime, deteriorating residential areas, environmental problems, long-term youth unemployment, racist violence, etc.? This question opens a broad and complex field of inquiry that we have been exploring in various ways over a couple of decades. During the last seven years, we have carried out a number of empirical investigations of initiatives that aim at developing a stronger capacity for designing and implementing effective strategies for managing complex societal issues. In this article we will make a review of the most important observations, insights and results from nine different empirical studies. Our orientation has been inductive rather than hypothetico-deductive, i.e. we have been looking for significant patterns in the data in order to develop hypotheses rather than testing assumptions in a stringent way. Rather than reporting findings with empirical details, we will present general conclusions and reflections. Some of these are to be regarded as work in progress requiring further and more dedicated

SOME RIGHTS RESERVED

investigations. However, we think we have some substantial contributions to offer, for example a discussion of how groups working on complex issues may need different types of scaffolding; an outline of a framework describing functions scaffolding methods can have for group processes; and a typology of four types of societal entrepreneurship.

The general purpose of this article is to contribute to the development of knowledge about and insight into the intricacies of strenghtening individual and collective capacities for managing complex societal issues. An additional objective is to tell the story of our own learning process. We were initially in some respects rather naïve when formulating questions and hypotheses, because we had not yet become aware of some of the complexities of the phenomena we wanted to explore. For example, we assumed, in a not particularly reflected way, that people with a strong complexity awareness would be more effective societal change agents than people with a weak complexity awareness. This assumption turned out to be far too simple. We believe it may be instructive for others to read about the insights we gradually developed, sometimes just by starting to reflect about the issues involved.

The Nature of Complex Societal Issues

Consider the contrast between two very different ways of responding to a particular societal intractable issue, crime and street violence in suburbs of large cities. The first statement comes from a discussion on the Internet forum Flashback in 2009 about a series of car burnings and ensuing stone-throwing attacks on police and rescue service vehicles in suburbs of Gothenburg, Sweden:

> The only reason this kind of thing happens is because we live in such a f-g wimp country. Everything and everyone is pampered. If the cops would run in and knock down these individuals with batons and rubber bullets between the eyes, I believe there would be law and order. That’s what they do in their native countries, but with real bullets so they naturally laugh at the Swedish cops who shake them a bit and drive them home to their parents who don’t care anyway. That violence breeds violence isn’t always correct. Meet these brats with violence and they will stop, guaranteed. Difficult to fight with broken joints. [*Translated from Swedish by the present author*]

The second statement summarizes main components of a strategy to engage the problem of gang-related crime at the community level:

> The program utilizes the OJJDP Comprehensive Gang Model, or the Spergel model, as it is often called, to engage communities in a systematic gang assessment, consensus building, and program development process. The model involves delivering the following five core strategies through an integrated and team-oriented problem-solving approach:
>
> - *Community mobilization,* including citizens, youth, community groups, and agencies.
> - *Provision of academic, economic, and social opportunities.* Special school training and job programs are especially critical for older gang members who are not in school but may be ready to leave the gang or decrease participation in criminal gang activity for many reasons, including maturation and the need to provide for family.

- *Social intervention,* using street outreach workers to engage gang-involved youth.
- *Gang suppression,* including formal and informal social control procedures of the juvenile and criminal justice systems and community agencies and groups. Community-based agencies and local groups must collaborate with juvenile and criminal justice agencies in the surveillance and sharing of information under conditions that protect the community and the civil liberties of youth.
- *Organizational change and development,* that is, the appropriate organization and integration of the above strategies and potential reallocation of resources among involved agencies. [From the website of the National Criminal Justice Reference Service, www.ncjrs.gov]

Both statements offer suggestions about how to deal with the problem of young men who engage in criminal activities that affect public safety in residential areas. However, they are radically different both in tone and in substance and can be thought of as positioned very far apart from each other on a scale ranging from simple to complex.[2] Our experience is that the spectrum of responses to complex and intractable societal issues is indeed very wide. When looking at the actual practice of authorities and other stakeholders in relation to complex societal issues of this kind, we find that there is often a large potential for improvement. We – the society – are not as skillful in managing serious and complex societal issues as we could be.

Our research is based on the premise that some of the societal issues we face are difficult to manage successfully precisely because they are complex in nature. Such issues have been called “wicked problems” or “wicked issues,” because they prove resistant to efforts to resolve them (Rittel & Webber, 1973; Chapman et al., 2009). The nature of “wicked issues” has been described somewhat differently in the literature. Here is a compilation of some salient properties that are often mentioned:

- *Complex causality*. Social, economic, technical, environmental, psychological, cultural, legal and other factors are involved. Conditions interact in complex ways.
- *Require systemic adaptation:* Because societal structures and processes are contributing to the emergence of the issues, isolated measures and quick fixes are ineffectual. Changes in the ways societal systems operate are needed.
- *Many stakeholders* are involved (e.g. authorities, public service organizations, businesses, citizen groups, lobbying organizations, politicians, researchers). Stakeholders have different levels of knowledge, different communication styles, different ways of making decisions, etc.
- Because of the complexity, the *issues cannot be delegated* to one actor. Conventional principles for public management are ineffectual. Cooperation among numerous stakeholders is necessary for achieving significant results.
- There are large, sometimes radical, differences in narratives and interpretive perspectives regarding the issues. There are often *deep-rooted disagreements* on (a) how to describe the issue and (b) what ought to be done, which often leads to difficulties in the decision-making processes.

---

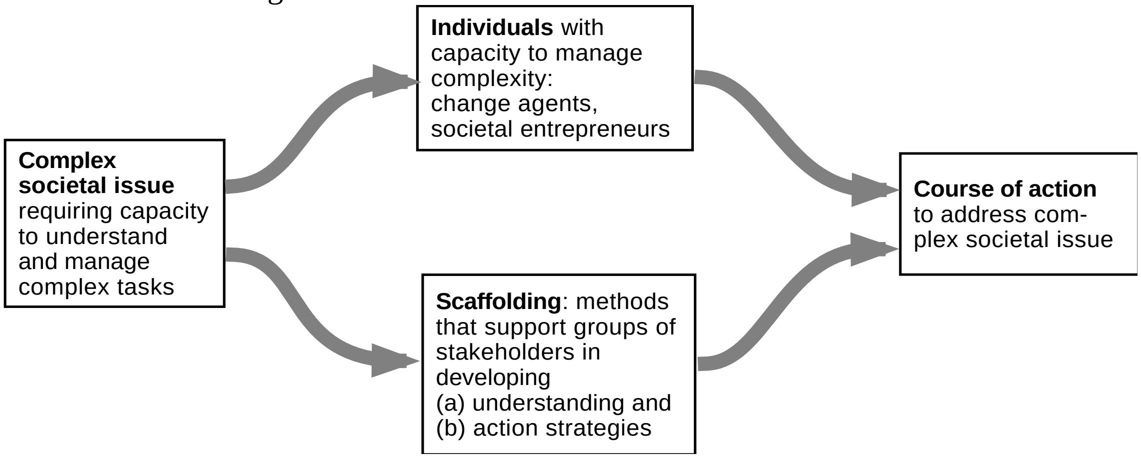
[2] Of course, the relationships between tone and levels of complexity in reasoning are far from straightforward. The examples used here are both extreme.

- *Chronic:* The issues cannot be solved once and for all; they will continue to exist to some extent whatever we do. Therefore there are difficulties in agreeing on how many resources should be devoted to the issues and what standards to apply when assessing outcomes (e.g., is a reduction in the rate of increase of environmental pollution a successful outcome or a failure?).

When societal issues have these characteristics, a considerable capacity for managing complexity seems crucial. In fields where the capacity to manage the serious societal issues is weak, a key concern is how to develop a stronger capacity. This topic has been our core focus for a long time.

Two Routes to Increased Capacity

We have in various ways explored two different routes to the development of such capacities (see figure 1). The first route relies on *individuals*: people who have competences to notice, understand and manage complex conditions and processes. Such individuals act in our society in different roles, for example as *strategic change leaders* (Brown, 2011; Higgs & Rowland, 2010; Joiner & Josephs, 2007; Vurdelja, 2011), *societal change agents* (Jordan, 2011; Perrini, 2006) or *societal entrepreneurs* (Gawell et al., 2009; Lundqvist & Williams Middleton, 2010; Jordan, 2011; Ross, 2009; Tillmar, 2009).[3] If we focus this route, we will be interested in learning more about the particulars of individual skills to deal with complexity. What skills or other properties of individuals are necessary and useful? What strategies are characteristic of successful change agents and societal entrepreneurs? How do we find people who have those skills? Is it possible to train individuals in the skills needed to manage complex societal issues? What conditions allow skillful change agents to put their skills to effective use? These are some of the questions that are relevant in order to develop more knowledge about how individual capacities to manage complex societal issues can be strengthened.



Individuals with capacity to manage complexity: change agents, societal entrepreneurs
Complex societal issue requiring capacity to understand and manage complex tasks
Course of action to address complex societal issue
Scaffolding: methods that support groups of stakeholders in developing (a) understanding and (b) action strategies

Figure 1: Two routes to more effective strategies for managing complex societal issues

---

[3] Societal entrepreneurs have been defined by Jordan (2011:49) as “people who (a) are committed to initiate innovative activities aiming at serving the good of the society (on some scale level: local communities, regions, countries, global society); (b) do it by organizing activities in new ways (rather than operating with existing organizations); and (c) seek changes that involve influencing how other actors and/or institutions operate (rather than just, like many *social* entrepreneurs, starting up a non-profit organization offering needed social services).

The second route does not assume that the capacity to manage complexity is necessarily a property of individuals. It instead presumes that most people can become effective managers of complex societal issues, given appropriate support. This is the idea that capacity can be created and strengthened through various forms of scaffolding (further explained below). One particular form of scaffolding highly relevant to our concerns is the many different methods available for structuring group processes with the purpose of supporting the participants to deliberate on how to manage complex issues, such as *The Integral Process for Complex Issues* (Ross, 2006a, 2006b, 2007; Andersson, 2008; Inglis, 2011), *Soft System Methodology* (Checkland & Poulter, 2006), *The Strategic Choice Approach* (Friend & Hickling, 2007), *Open Space Technology* (Owen, 2008) or *Future Search* (Weisbord & Janoff, 2010).[4] In order to follow this route to increased capacity, we need knowledge about what different groups and individuals need support *for*. For example, it is important to understand what meaning-making patterns may stand in the way of entering an effective strategy-development process, as well as what shifts in participants' meaning-making are helpful.[5] We need to understand which properties of methods are effective in supporting groups. We need to know what skills facilitators need in order to assist groups with different characteristics. If effective methods indeed exist, we also need to understand what it takes for such methods to actually become adopted and used among practitioners. It is our impression that few stakeholders realize that there may be a considerable potential for increasing the quality of how groups manage complex tasks through appropriate scaffolding. There appears to be an unreflected assumption that how groups ordinarily deal with such issues is as good as one can expect.

Figure 2 offers a more specified overview of themes we have explored. Some of these have been subject to more systematic and detailed research, while others are topics we have encountered and reflected upon while pursuing our different case studies. In the following, we will in turn comment upon most of these themes.[6] But first we will briefly describe the nine studies that make up the empirical basis for our reflections.

Overview of Our Empirical Studies

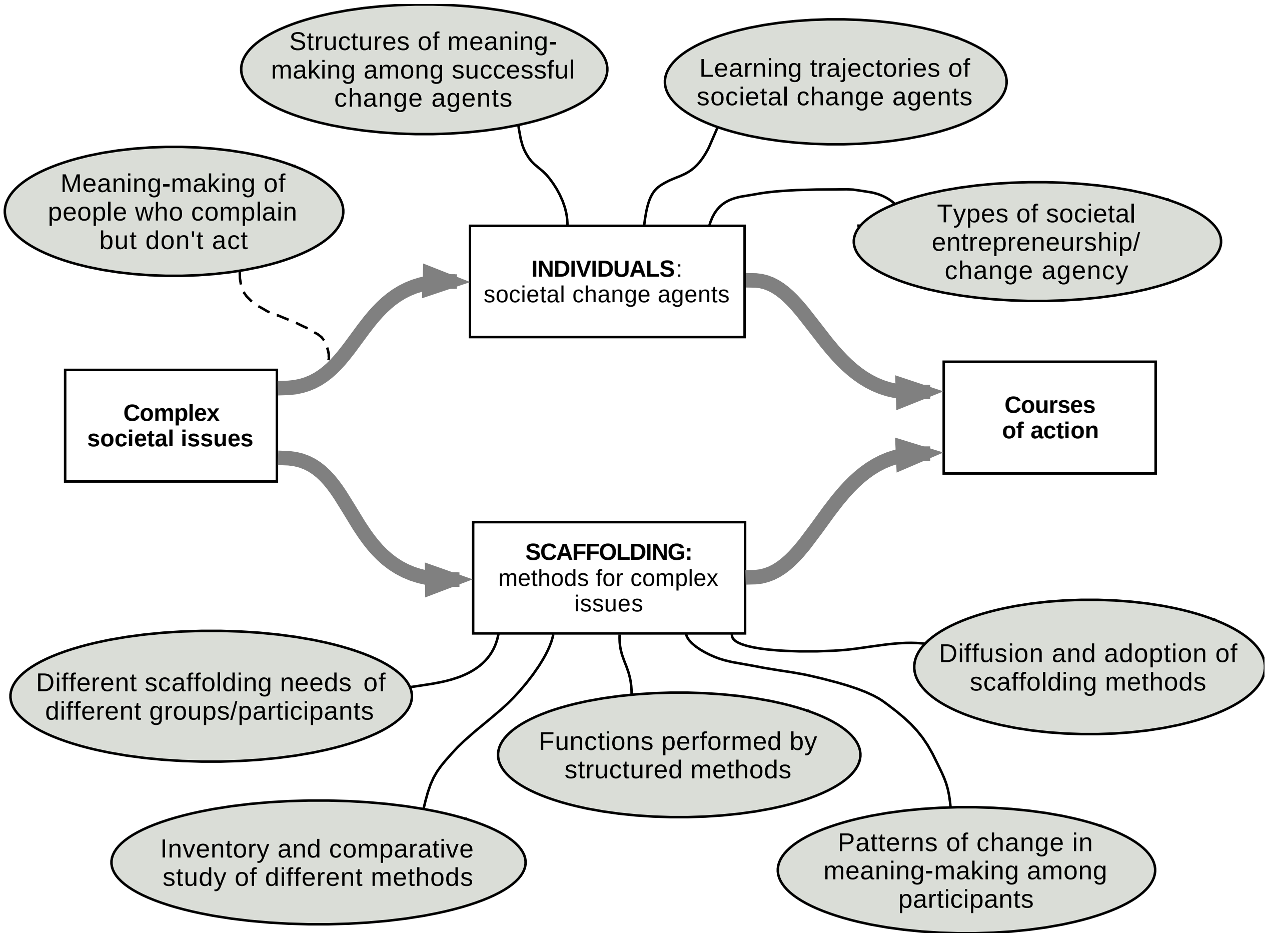
In the early 2000s we started to engage in empirical research on the relationship between meaning-making patterns and action strategies among people engaged in societal change agency (Jordan, 2003, 2006a). Since this work began we have carried out two research projects involving 24 interviews with individual change agents (Jordan, 2006a and ongoing research), one (ongoing) research project on methodology for facilitating strategy development in complex societal issues (a pilot study is reported as Andersson, 2008), and six in-depth case studies of successful societal change agents (Jordan, 2006b; Andersson & Jordan, 2007; Sander & Jordan, 2009; 2011; Emanuelsson, 2011; Tiger, 2012). We will briefly describe these studies, as they form the empirical basis for the reflections in this article.

---

[4] Holman et al., 2007, Bunker & Alban, 2006 and Turunen, 2012, offer overviews.

[5] We use the term "meaning-making patterns" to denote the structures of cognitive processing (see Jordan, 2011).

[6] However, an analysis of the important topic of the shifts and transformations in meaning-making that occur among participants in the course of scaffolded strategy-development processes will be left for Pia Andersson's coming doctoral dissertation. Patterns of meaning-making among people who complain, but don't act, have been analysed in a separate forthcoming article by Thomas Jordan.



Structures of meaning-making among successful change agents
Learning trajectories of societal change agents
Meaning-making of people who complain but don't act
Types of societal entrepreneurship/ change agency
INDIVIDUALS: societal change agents
Complex societal issues
Courses of action
SCAFFOLDING: methods for complex issues
Different scaffolding needs of different groups/participants
Diffusion and adoption of scaffolding methods
Functions performed by structured methods
Inventory and comparative study of different methods
Patterns of change in meaning-making among participants

Figure 2: Themes we have worked on

1. In one research project (Jordan, 2006a), one of us studied how individuals with post-conventional meaning-making patterns approached organizational and societal change processes, in particular what kind of strategies they used for dealing with inertia and resistance. Extensive interviews were made with 19 individuals, most of whom worked within larger organizations, such as governmental agencies and ministries, NGOs and regional administrations.[7]

2. In one sub-study in the ongoing research project *From frustrated citizens to effective societal entrepreneurs*, Pia Andersson and Ylva Mühlenbock interviewed 5 carefully chosen persons involved in successful societal entrepreneurship. The purpose of this study was to learn more about the relationships between various types of complexity awareness, strategies used in the initiatives and the outcomes.

3. In the study *Tryggare och mänskligare Göteborg – An innovative approach to urban crime prevention and safety promotion* (Jordan, 2006b), Jordan made an analysis of the meaning-

---

[7] See also the interview with Thomas Jordan made by Russ Volckmann in Integral Review no 1, 2005 (http://integral-review.org/).

making structures and the strategies employed in the office of the Gothenburg council for crime prevention and safety promotion.

4. Andersson and Jordan (2007) made a comprehensive case study of the methodology developed by the youth workers in a youth center in one of Gothenburg's economically disadvantaged suburbs. The approach developed in this center is multidimensional and integral, addressing the developmental needs of individual teenagers, as well as group culture, collaboration between societal actors and neighbourhood fieldwork.

5. In our ongoing research project *From frustrated citizens to effective societal entrepreneurs* Andersson carries out action research using TIP, The Integral Process for Complex Issues, in order to study how the process of developing more effective action strategies can be scaffolded in groups with participants with varying backgrounds. A pilot study was reported as Andersson, 2008.

6. In another comprehensive study Sander and Jordan (2009) analysed a complex project in the city of Gothenburg, aiming at developing an integrative strategy for managing one of the more conflict-ridden issues in the city, graffiti.

7. Sander and Jordan (2011) also made a detailed analysis of the learning trajectory of the key individuals in Fanzingo, a societal entrepreneurial organization with the aim of enabling suburban youth in the Stockholm region to tell their own stories in radio and TV and thereby opening up public service media, traditionally dominated by middle-class, middle-aged ethnic Swedes.

8. Emanuelsson (2011) traced the relationship between meaning-making patterns and action strategies in the work of one woman who has had a considerable impact working with the difficult issue of honour-related threats and violence in a region in Sweden.[8]

9. Tiger (2012) made a detailed case study of the work carried out over more than a decade by a project leader employed by the Swedish tenant organization, who took on the task of developing new strategies for mobilizing residents in a suburb of Gothenburg with a large concentration of war refugees from Somalia, former Yugoslavia and other parts of the world.

Common to these nine studies is an interest in the relationship between (1) patterns of meaning-making, including cognitive obstacles to skillful means and patterns of transformation through increased complexity awareness; (2) scaffolding of learning and strategy development; and (3) action strategies and outcomes.

---

[8] Honour-related threats and violence are mostly directed towards young women by family members who believe that the woman has brought dishonour upon the family or community by her life style.

Some Theoretical Points of Departure

Theoretical Concepts and Discourse

Our research focus is to gain a deeper understanding of the role differences in and transformations of meaning-making structures plays in developing capacity to manage complex societal issues skillfully. In a previously published article, there is a comprehensive outline of the theoretical framework we have been using (Jordan, 2011). For the purposes of the reflections on lessons learned in this article, we will just make some brief comments on concepts that are necessary for understanding our approach. Our theoretical framework draws heavily on models of adult development, developed by researchers and researcher-practitioners like Loevinger (1976), Fischer, (1980), Kegan (1982, 1994), Basseches (1984), Commons et al. (e.g. 1984, 1998), King & Kitchener (1994, 2004), Torbert et al. (2004) and Joiner & Josephs (2007). We have found two key concepts to be particularly useful in understanding meaning-making regarding complex societal issues: *complexity awareness* and *perspective awareness.*[9]

Complexity awareness refers to a person's propensity to notice and expect that phenomena are compounded and variable, depend on varying conditions, are results of causal processes that may be linear, multivariate and systemic, and are embedded in processes that may lead to consequences in several steps. We believe that the strength of a person's complexity awareness conditions the ability to successfully manage complex tasks. Several theoretical models exist for analysing levels of complexity in, for example, reasoning (Fischer, 1980; Commons et al., 1984, 1998; Jaques & Cason, 1994; Dawson & Wilson, 2004). One of the most used models is MHC, the Model of Hierarchical Complexity (Commons, 2008), which defines 14 levels of increasing hierarchical complexity. Five of these levels are highly relevant for analysing meaning-making. At the *Concrete* level, meaning-making is confined to talk about concrete things, people, events, acts and places. At the *Abstract* level, categories are formed and enable people to refer to things in general, rather than exclusively to specific, concrete things. At the *Formal* level, abstractions are coordinated through mental conceptions of how they are related to each other in terms, for example, of linear (unidirectional) causation. At the *Systematic* level, formal relationships are coordinated to form systems of relationships, allowing for reasoning about mutually conditioning relationships and systemic causation. At the *Metasystematic* level, two or more systematic relationships are related to each other, allowing for reflection on properties of whole systems and how systems interact. One of the most significant and useful aspects of the concept complexity awareness concerns the role of an *absence* of complexity awareness in the meaning-making of a person or a collective. If a person does not notice the complexity in which an issue is embedded, he or she will fail to consider many conditions, causes and consequences that may be significant for managing the issue (Kuhn, 1991).

Perspective awareness refers to the propensity to notice and operate with properties of one's own and others' perspectives, i.e. whole systems of meaning-making. People with a strong perspective awareness notice that perspectives have properties that strongly influence how events and issues are perceived, interpreted and managed by oneself as well as by others. People with weak or non-existent perspective awareness do not notice that meaning is constructed all the time through the filters of perspectives. They consequently act as if they perceive reality “as it really is.”

---

[9] These concepts are discussed in a far more elaborated way in Jordan, 2011.

Assuming that weak complexity and perspective awareness is a common reason for poorly conceived strategies to deal with complex societal issues, the concept of scaffolding is strategically important. In simple words, the concept scaffolding points to everything that can be done to support individuals or groups to accomplish tasks that would be beyond their reach without external support. The most common use of scaffolding is to refer to support children, adolescents or adults need while they are in the process of acquiring new skills. The scaffolding is then needed only temporary: when the skills have been mastered, the scaffolding can be removed. However, the term is appropriate to use also in cases where individuals or groups need external support in some form in order to accomplish a difficult task, without implying that they will later be able to master the task without scaffolding. Scaffolding may consequently have two different functions. The first is to provide support during a period of skill acquisition, the second is to enable an individual or a group to accomplish a particular task, such as developing a strategy for managing a very complex issue. We are interested in both functions, but here we focus on the latter.[10]

A weak complexity awareness is not only the absence of something, but may also be associated with quite resilient ontological assumptions, i.e. a worldview that seems fully adequate to the actor but which is blind to significant conditions. This means that meaning-making structures may need to be de-stabilized or even disrupted before new insights can become possible.

The volume of previous constructive-developmental research on meaning-making in societal issues is relatively small. Deanna Kuhn (1991) and Shawn Rosenberg and colleagues (1988, 2002; Rosenberg et al. 1988) have made comprehensive analyses of how people with different levels of complexity awareness reason about complex societal issues. Barrett Brown (2011) has studied the meaning-making of societal change agents with late post-conventional worldviews. Little research has been made on methods for scaffolding increases in complexity awareness in groups working together in order to develop more effective strategies (Ross, 2006a, 2006b, 2007; Inglis, 2011; Chapman, 2010). Research on change methods has been relatively limited, with the exception of research on methods developed in the field of operational research, such as Soft System Methodology.[11] In her recent dissertation, van der Zouwen (2011) develops a framework for evaluating methods for participative organisational change, with a focus on “large scale interventions.” The framework points to a large number of factors that are relevant for successful scaffolding of group efforts in complex issues. However, van der Zouwen’s study does not consider scaffolding of complexity awareness or other developmental aspects of scaffolding.

---

[10] For further discussions on scaffolding, see e.g. Hlemo et al., 1976; Stone, 1993; and Wood et al., 1976.

[11] See for example the two special issues of *The Journal of the Operational Research Society* on “problem structuring methods” in 2006 and 2007, in particular the overview article of Rosenhead (2006).

Scaffolding Group Processes

General Remarks

Over the last couple of decades, a large number of methods/approaches have been developed for assisting groups of stakeholders in developing solutions to complex issues. In our own case, we have used one particular method, The Integral Process for Complex Issues (TIP), in our action research (Ross, 2006c; Andersson, 2008). The principal reason for this choice is that TIP was designed (by Sara Ross) to serve as a scaffolding of a progressive development of awareness of and knowledge about the complexity of a significant issue, thus enabling a group to choose a strategically important element of the problem complex to work with. TIP starts by making an inventory of the participants' concerns. When working with people not trained in analysis, the participants' views may be primarily at MHCs concrete stage of complexity, which means that they have rather unorganized narratives of concrete incidents and problems. In TIP, these narratives are organized into categories (MHC: abstract stage), and then the participants are invited to look for causal relations between different issues, problems and conditions (MHC: formal stage). In the further process, participants are supported in exploring systemic conditions (MHC: systematic stage), and even (at least in some cases) in using the contrast effect of different perspectives that may be applied to understanding and deliberating about action on the issue (MHC: metasystematic stage).

Different Types of Groups, Different Needs for Scaffolding

We have made direct observations of the dynamics in groups of people working on action strategies in complex issues in a number of different groups. In seven cases, the observations were made as action research where the researcher was a process leader for groups working in a structured process in multiple meetings. In a further ten cases we have worked with different types of groups in less comprehensive settings, sometimes in the role as consultant process leader, sometimes as a part of method-demonstrating workshops.[12] Reviewing the cases in terms of the background of the participants making up the groups, we can discern seven categories:[13]

- *Concerned citizens* (e.g. in a particular neighbourhood) who are reasonably familiar with how organizations and authorities function.
- *Immigrants/refugees*, who are not familiar with practices in a Western democratic state.
- *Officials* for whom the issue belongs to the responsibilities within their job description: civil servants and representatives for different organizations/authorities/administrative units.
- *Employees in service organizations*, such as educational institutions, social services, health care, police.

---

[12] These ten cases were not part of systematical studies, but contributed to our pool of experiences of different dynamics.

[13] Commentators of a draft of the article have cautioned us about the risk of lumping people together into categories in this way, because of the risk of stereotyping in an unwarranted way. We hope the reader recognizes that we don't mean to imply that all immigrants, all young people, or all officials are alike . . .

- *Activists*, with an established commitment to engage a certain issue from a certain standpoint.
- *Youth*, with an interest in an issue, but often ephemeral commitment.
- High-ranking *managers* and *politicians* in elected offices.

Working with this variety, we have encountered different types of dynamics both regarding individual participants and groups. These experiences point to a need to adapt the scaffolding as well as the actual facilitation style to the specific needs of specific groups. In order to be able to do this, it is probably useful to have a clear understanding of what functions the scaffolding can serve in a group process, and how groups vary in their needs for support.

In the following, we will first discuss some variables we have found to be relevant in describing how individual participants and groups are different from one another. In the second step we will outline our preliminary formulation about what functions various change methods are supposed to fulfill.

Participants and groups can differ in very many ways, of course. When looking for variations, we are particularly interested in gaining a clearer understanding of differences in participants' meaning-making structures and how such differences might lead to a need for adapting the scaffolding.

An overview of the variables we have identified as relevant so far is given in Table 1. These variables are particularly significant when they present obstacles or challenges for an effective group process. Some methods developed in order to scaffold strategy-development processes are probably more sensitive to some of these variables than others. This is a topic we have not explored deeper yet.

We will not here discuss each of the variables in Table 1, as some of them are rather self-explanatory. However, in our work with some of the groups, we encountered challenges that led to new insights into the craft of scaffolding processes, and we will here focus on these.

Table 1: Variables describing different scaffolding needs in groups

Variable	The variable is particularly relevant when ...	Examples of participants for whom the variable may be particularly relevant	Scaffolding needs
Motivation to engage personally	... participants' personal motivation to engage is weak	Frustrated citizens; Officials	Mobilize motivation and issue ownership
Perseverance	... motivation is momentary strong, but capacity for perseverance is weak	Youth	Capture volatile interest, focus on actions that lead to rapid outcomes

Variable	**The variable is particularly relevant when ...**	**Examples of participants for whom the variable may be particularly relevant**	**Scaffolding needs**
Cultural competence	... participants have very limited knowledge about and skills in interacting with organizations and societal functions	Immigrants from countries with a very different type of society; Participants without experience in organizational practices	Build bridges between very different life-worlds. Needs-initiated learning about how the society functions and about effective behaviours in different situation.
Complexity awareness	... participants believe that the problem is easily resolved (e.g. if other actors do what they ought to do)	(Relevant for many groups)	Support inquiry into relevant conditions, causes and consequences
Perspective awareness	... participants are aware that the issue is complex and requires systemic adaptation, but have closed views about effective strategies	Activists; Politicians	Open up interpretive perspectives; Focus on a manageable but strategic part of the problem complex
Maturity of problem formulation	... (a) it is unclear which part of the issue complex the groups should focus on; ... (b) participants want to work with issues that are too abstract or broad in relation to the group's capacities or authority	(Relevant for many groups)	Support the process of mapping the issue complex in a systematic way, so that a strategic and manageable issue can be chosen for focussed action
Experience of powerlessness and self-confidence	... participants see themselves as outsiders and/or have low confidence in their own possibility to influence the issue ... participants expect that others will fulfill their interests	Immigrants; Citizens with limited experience of self-organization	Support insight into realistic possibilities to exert influence; create experiences of success in influencing issues

Variable	The variable is particularly relevant when ...	Examples of participants for whom the variable may be particularly relevant	Scaffolding needs
Collective identities	... participants have a strong identification with a particular collective and are concerned with advocating the interests and identity of their own group	Managers at high levels; Employees and specialists with strong professional identities; Politicians; Individuals who identify themselves as members of ethnic groups.	Recognizing the legitimacy of identities while expanding focus to a holistic perspective on the system

The groups we have worked with differed greatly in the extent to which the participants had developed more complex interpretations of the causes and conditions relevant to the issue and its systemic properties. In one of the groups we found that the scaffolding we used seemed to work against the group's own sense of where they wanted to go with their topics of concern. Although the end result to some degree was satisfactory to the group participants, the experience caused us to reflect on how groups' needs for scaffolding differ and how we can understand and explain those differences.

In the particular group mentioned above, three characteristics stand out. First, the participants' understanding of their area of interest (local economies) was well developed. Many of them had spent a lot of time gathering knowledge and building a systemic understanding of this field. Secondly, many of the participants also had elaborated views on what ought to be done, namely fundamental changes in the way the society operates (e.g., local sourcing of consumer goods; introduction of a local currency). These views were often rather "congealed," i.e. these participants felt that they had valid reasons for their positions and they were not inclined to inquire into and reassess their own assumptions and convictions. Thirdly, when approaching the matter of choosing a common focus for action, there were substantial differences regarding participants' priorities.

At first sight, one might have expected such a group to be rather well suited for working with TIP. The participants already had an awareness of systemic properties that could be built on, and there was an explicit intention to converge around a manageable part of the whole problem complex. In practice, however, the process did not turn out to be so smooth.

As noted above, TIP proceeds in a structured fashion, intending to build participants' awareness of the complexity of the chosen issue in focus. Creating an inventory of participants' concerns and then looking for causal relations between the different concerns listed is a process well suited for scaffolding the emergence of complexity awareness, particularly when the concerns listed initially are of a more concrete nature. This group, on the other hand, primarily brought up concerns of a systemic nature (for example the role of growth in modern industrial economies, the development of the relation between housing costs and wages over time) in the initial inventory, and were already well aware of the many links of mutual causation between these concerns.

Early in the process we could thus say there was a mismatch between the scaffolding's level of complexity and the group’s experienced need for help to work on their issue of concern, with the group’s meaning-making actually being more complex than the structure of the first scaffolding step. This affected the process in several ways and the first session with the group did not yield the type of insights other groups had had in the mapping phase. In all other groups that we had worked with so far the outcome of this initial step had resulted in increased clarity about the interrelated topics of concern, new insights and a more defined directions forward with enhanced motivation to continue together. In this case however, some participants felt that we as facilitators were superimposing a structure that pushed them to abandon their systemic understanding. For some of them, their insight into the problem’s embeddedness in complex systemic societal properties led them to think that they necessarily had to find ways of transforming those systemic properties. The TIP procedure of creating a map of the territory of their concerns in order to choose a manageable strategic part of the problem complex seemed counterintuitive, and more like a matter of enforced simplification than one of strategic choice. This did not facilitate a re-examination of the group’s assumptions about problem causes and solutions – if anything it made participants' views more congealed.

The lack of fit between the scaffolding and the group’s meaning-making made the participants struggle to understand the method itself, rather than focus on their own process of making actionable decisions, integrating their different views on what ought to be done. Reflecting back on the experience, we can see that in this sense the process we used in fact prevented the participants from working constructively on their significant differences and conflicts regarding the topic of interest that had initially brought them together. Had we had more focus on this work, the exploration of different perspectives present in the group may in itself have had a decongealing effect.

Our suggestion is that scaffolding needs to be adapted in relation to the complexity level of the group's meaning-making, even if the method used is designed to handle different levels of complexity. In a group that has developed the capacity to see systemic issue-properties, but may also have a fairly congealed view on solutions, we suggest that a focus on exploring different perspectives on the issues’ solutions as well as causes would yield more learning and create a platform for choosing a strategic part of the problem complex that seems manageable in terms of the group’s resources.

Our experience has also shown us that some groups, like the one above, have a deep need to understand the process steps and their functions before starting, whereas other groups would rather just get into the work and find out where it leads. In both cases, it is important to pay keen attention to the group’s intentions and experienced needs so that the process can evolve organically. A simple table might be helpful in sorting out some different scaffolding needs (Table 2).

Table 2: Varying scaffolding needs depending on meaning-making structures

View	**Weak complexity awareness + weak perspective awareness**	**Strong complexity awareness + weak perspective awareness**	**Strong complexity awareness + strong perspective awareness**
Uncongealed view	Scaffolding can focus on a stepwise and not too hurried exploration of complexity. It might be too demanding to scaffold perspective awareness.	Scaffolding can proceed rapidly in mapping complexity and may focus on supporting development of perspective awareness.	Only light scaffolding is needed.
Congealed view	Participants may believe the problem is simple, and may have fixed opinions about solutions. Facilitators may need to be very explicit about explaining and getting agreement about the process steps.	Participants may have strong convictions about causes and solutions. What needs to be scaffolded is a reexamination of assumptions about causes and solutions and an insight into the usefulness of exploring different perspectives on the issue.	*Not a likely combination*

The matrix in Table 2 suggests that it is easier to scaffold a strategy-development process when participants do not have congealed views about the issues, causes and solutions. If participants have congealed views, it might be necessary to devote a lot of attention to "decongeal" perspectives, so that an exploration of a broader spectrum of causal relations and possible measures becomes possible. The design of the scaffolding is also dependent on the levels of awareness among the participants. Of course this becomes a complex matter when the participants' structures of meaning-making are very different, i.e. when some participants have very weak complexity and perspective awareness, while others have strong levels of awareness. In the groups we have worked with, there certainly were such differences among the participants; no group was completely homogeneous. Participants with stronger complexity awareness may become impatient with the tendency of participants with weaker complexity awareness to go on talking about one concrete example of an issue after another. The latter feel that they add new material to the conversation, whereas the former feel that they keep repeating essentially the same thing. Participants with stronger complexity awareness may want to proceed to talk about the problematic on a higher level of complexity: the general category of the problematic, its causes and consequences, or even problematic properties of the system sustaining the existence of the problematic. The facilitator may here assist participants talking at concrete and abstract levels in their storytelling in order to arrive at a more general formulation of the essential patterns of the issues they are concerned about. A participant with stronger complexity awareness may be offered tasks in the process that makes productive use of their capacities, so as to make the process more interesting to him or her. Such a task may, for example, be to write up summary descriptions of the group's work for review and for communication with other stakeholders.

Functions of Scaffolding Methods

Reviewing the literature on change methodologies, which is small in volume, we conclude that the field is poorly conceptualized in terms of an analytical framework for comparing and analysing what the methodologies really do and how.[14]

In her doctoral dissertation, van der Zouwen (2011) analysed the conditions for successful use of change methodologies, including discussing the design properties of the methods themselves. However, the general impression is that much remains to be done in order to gain insight into what functions scaffolding methodologies actually fulfill and in particular what elements of the methodologies are helpful in assisting groups to work effectively together on complex issues.

We have started to explore this issue by compiling an inventory of the functions different methods are supposed to fulfill. Sources for the items in this inventory are our reading of manuals, articles and books, as well as our own observations and inferences in action research and in conversations with experienced facilitators. The list presented in Table 3 should be regarded as work in progress: we expect to investigate these functions more systematically in the near future.

We have organized the functions in six categories. The first is called *Attentional support*, and comprises the functions that cater to the needs of individual participants and the group as a collective to focus, structure and strengthen attention so that effective work on significant issues become possible. The second category is *Relationships*, relating to the need to support the establishment of contact and trust between participants, thus paving the way for openness in communication. The third category is *Attitudes/Feelings*, involves supporting, if necessary, a shift in the attitudes and feelings among the participants toward a sense of ownership, motivation and hope regarding the issues at hand. The fourth category, *Understanding*, is of course a major one,

Table 3: Functions of change methodologies

Function	Objectives of Methods
I. Attentional support	• Focus the attention of the participants on the same issue/topic in order to enable a group to work together. • Structure the attention of the participants on one task at a time, e.g.: make inventory of relevant issues, formulate goals, analyse issues, develop of action plan, coordinate implementation, plan assessment. • Making unreflected assumptions and interpretations visible and opening up (even disrupt) the participants' mental frames in order to open space for new approaches and ideas.

---

[14] Some discussion of the characteristics of change methods are, however, offered in Holman et al. (2007).

Function	Objectives of Methods
II. Relationships	• Create safe space: a sense of being welcome and establishment of basic trust that lowers the threshold to engage in conversation and collaboration. • Create propitious conditions for establishing rapport and personal relationships between people who did not know each other personally before. • Release energy locked in conflictual relationships in order to enable a sense of community to emerge and to enable creative and productive use of differences in perspectives and interests.
III: Attitudes/Feelings	• Mobilize commitment, energy, hope that common efforts might lead to meaningful outcomes. • Shift focus from obstacles, frustration and blaming towards possibilities. • Strengthen the participants' feeling of accountability for actions and outcomes.
IV. Understanding	• Clarify and formulate the participants' interests and needs so that these can be communicated and understood by decision-makers and/or other stakeholders. • Share relevant information so that participants can see and understand the conditions, causal principles and possibilities of the larger system the issues are embedded in. • Arrive at a shared narrative of the situation and a common strategy. • Increase awareness of the properties of diverse perspectives, enabling the participants to make creative use of the tensions between different perspectives on causality, values and desirable measures.
V. Empowerment	• Create propitious conditions for mobilization and activation of the participants' knowledge, skills, creativity and other resources. • Neutralize asymmetrical power relations that obstruct effective collaboration.
VI. Coordination of action	• Coordinate implementation of a strategy through planning, management and evaluation.

because participants need to educate themselves about the different conditions, possibilities, potential consequences, etc., involved in managing complex societal issues. The fifth category, *Empowerment* is about supporting the development of the participants' self-image and feelings so that they feel they have the potential to significantly influence the complex issue they are concerned about. The sixth and last category, *Coordination of action,* involves supporting the process of planning the implementation of the ideas the group has developed in their strategy-finding process.

Our experiences through six years of investigating and putting TIP into practice - as well as coming into contact with other change methodologies through our research and networks - have shown us that most of the above functions are somehow central to most methodologies. Yet when speaking to practitioners of different methods, we have found that different functions have been emphasized, depending on both the context the method is designed for, and the underlying values and theories that were central to the development of the methodology itself. Also, the way in which they seek to scaffold the functions may differ significantly. For example, as regards *Attentional support*, one method may emphasize the importance of following participants' evolving interest and reasoning, continually setting and resetting the focus for discussions, and use only minimal facilitation to structure the exchange. Others may be much stricter, with facilitators making sure all attend to the specified topics in a given order. As regards supporting a group's growing *Understanding*, some methods' designs show a bias towards facilitating the emergence of innate creativity of the participants, and assume that understanding emerges organically from this process. Again, other methods are firmly structured and facilitated so as to make the issue-complexity visible in order for the participants to understand the deep levels of cause and effect, before creative solutions are at all considered. As regards how to establish and work with conflict in the field of *Relationships*, some methodologies may actively focus on and intervene in existing conflicts between (groups of) participants, whereas others may actively marginalize symptoms of conflict by focussing on a common task. More research is needed to further elucidate such differences. We believe that a clearer understanding of what functions various forms of scaffolding actually perform for groups engaged in strategy development can lead to more skillful design of methods, as well as more skillful in-process facilitation on the part of facilitators.

Facilitation Dilemmas

A challenge for the study of the functions of methodologies is that while a method itself may be structurally designed to support certain functions, through its step-wise design, rules and/or specific techniques, other functions may be scaffolded more implicitly, through the facilitator's skills. These functions are not static. In real time, "situational polarities" emerge through the process, leaving it up to the facilitator to make moment-to-moment choices. "*How long shall I let this one person that keeps repeating the same point continue? Shall I openly acknowledge the conflicting camps in the room, when they themselves do not mention these? Can we take the next step now so we do not run out of time towards the end?*" In our experience, even with a very structured method such as TIP, there are still times when hard, in-the-moment choices surface during the process itself; demanding skills of timing, how to tailor the method-steps to fit the specific actors, as well as in-process conflict management; skills that depend on the meaning-making of the facilitator in the moment, of how she or he understands the context, the function of each part of the method and what emerges in the group processes. It must also be noted that while some facilitator techniques may be well in line with the explicitly stated goals and principles of the methodology, others may be of a more sensitive nature and not explicitly acknowledged. An example would be when a facilitator actively seeks to marginalize a talkative participant who is perceived to be obstructing the process, without this being openly discussed. When it comes to the sensitive issues of voice and power, there are many such questions of an in-process nature left to explore.

A Note on the Issue of Power

It is important at this juncture to raise the issue of power since methods and philosophies for structuring group work on complex issues, especially in the fields of deliberative democracy and conflict management, are sometimes criticized for being ignorant of or blind to power issues.[15] A closer look at the contents of the critical comments reveal that there are several different concerns involved, which may lead to confusion if the perspectives generating the comments are not articulated clearly. Two examples of conversations we have had may be instructive. On one occasion, in a method demonstration seminar, we worked on the issue of how to deal with unrest in classrooms. One seminar participant was quite upset that we as facilitators did not take the initiative to raise the gender dimension of the problematic. The participant felt that a failure on the part of the facilitators to actively address that boys and girls may play very different parts and be affected in different ways by classroom disorder would make the facilitators part of the structures that maintain a gender blindness in our society. Her position was that the facilitator has a moral obligation to advocate a power perspective, even if the members of the group in question would not voice such concerns. On another occasion, a participant in a seminar criticized the absence of a power perspective in our presentation. On further inquiry, it turned out that this person was concerned about the problem of group members who feel powerless and have low self-confidence and therefore don’t speak up or engage actively when the group talks about issues they are concerned about.

---

[15] See e.g. the discussion in Kadlec & Friedman, 2007. Some of these critical comments seem to address the critics' poorly informed assumptions about how these methods function rather than the how the methods are actually practiced. This is, however, a too complex topic for this article.

There are many possible perspectives on power. In table 4 we outline four approaches relevant to scaffolding in work on complex issues, drawing on Ken Wilber’s quadrant model for classifying perspectives (Wilber, 1995; 2006). The first column comprises perspectives that stress the subjectively experienced meaning of identities, relationships and other relevant constructs. The second column represents perspectives that look at phenomena from the outside and stress patterns that can be objectively described and evaluated.

Table 4: Four perspectives on power relevant to scaffolding of group processes

	Interior focus	**Exterior focus**
Individual focus	*Construction of power:* The subjectively experienced sense of being able to exert influence in significant issues; the sense of external or internal locus of control. *Adherents’ prescription:* Focus on empowering individuals through strategies that assist transformation of self-image and internalizing locus of control.	*Construction of power:* Interpersonal behaviours that create unequal or equal relationships; e.g. behaviours that aim at dominating/subordinating others. *Adherents’ prescription:* Focus on neutralizing domination behaviours by exposing them and by using countertactics. Support use of behaviours that lead to fair interactions.
Collective focus	*Construction of power:* Socially constructed attributions and identities that create power differentials between people due to their ascribed identity. *Adherents’ prescription:* Focus on exposing and transforming social constructions and attitudes that attribute high/low rank/status to certain categories of people (men/women, white/black, people with lower or higher education, etc.).	*Construction of power:* Structural power differentials determined by positions in unequal social systems, unevenly distributed power resources, etc. which create unfair conditions. *Adherents’ prescription:* Focus on exposing structural inequalities and power differentials in order to stop or prevent abuse of power and to contribute to structural changes towards more equality.

All four power perspectives raise tricky ideological, moral and/or ethical questions regarding the roles of facilitators. A power-sensitive approach means that the facilitator has to ask hard questions about whose best interests he or she serves, and how these interests are constructed. Should the facilitator only offer the services that the group asks for, irrespective of the facilitator's own value system? What if the facilitator notices behaviours and conditions that he or she feels are unfair, but none of the group members seems to be aware of what is going on? Does the facilitator have a moral obligation to point out, expose and counteract domination behaviours, social constructions that create an unequal power distribution or structurally determined injustices? These are, of course, questions that cannot be answered in the abstract, but must be responded to in a contextualized way.

When the existence of injustice and inequality due to an uneven distribution of power in societies, in organizations and in interpersonal relationships is the main preoccupation, it is quite natural to be highly sceptical towards the whole business of methods and approaches that aim at involving stakeholders in a common, collaborative process on how to manage controversial societal issues. One is then more inclined to either take on the role of advocating certain views or, particularly if one happens to be an academic researcher, to be careful to keep an outsider position in order to stand free from the establishment and critically analyse societal conditions and processes. These critical observers of course play a very important role by pointing out problematic phenomena.

A Note on the Issue of Problem Ownership and Implementation

Methods for scaffolding deliberative processes may be very powerful in creating favourable conditions for the development of well-designed strategies. However, these methods cannot in themselves guarantee that the measures proposed would actually be implemented, if crucial decisions have to be made by decision-makers who did not participate in the process. Our experience, which is echoed by several practitioners, is that the participation in deliberative processes often leads to deep insights into the needs of a problematic as well as to a commitment to take certain actions. The participants really own their issue and the strategies they have developed. However, this understanding of the issue and the commitment to act is not easily transferable to decision-makers and other stakeholders who did not participate in the deliberative process themselves. Using a deliberative process for issues where crucial resources are controlled by non-participants is a risky venture, because hopes may be raised through the process that are later squashed by disinterest, lack of understanding or obstruction on the part of decision-makers. Not only is there a considerable risk that good plans will be disregarded, but also that the lack of implementation will leave participants feeling more disillusioned and powerless than if they had not engaged in the process at all.

Diffusion of Social Innovations

It seems evident that the society indeed faces a number of complex societal issues where the need to develop more effective strategies for managing serious problems is very strong. It also seems evident that there *are* forms of scaffolding that might contribute to a better capability to manage complexity. However, the existence of methods that fit needs does not automatically mean that those who have the needs actually make use of the methods' approaches. If we think of new forms of scaffolding, such as TIP and similar methods, as social innovations, the diffusion of such innovations becomes a key topic for study. In a much-cited article, Akrich, Callon and Latour (2002), outlined a non-linear approach to the study of innovation and innovation diffusion. They contrasted their own perspective with a more traditional, linear, explanatory framework as follows:

> […] the success of an innovation may be explained in two different ways, one emphasising the innovation's intrinsic qualities, the other on its capacity to create adhesion between numerous allies (users, intermediaries, etc.). In the first case, we use the term "diffusion model" (the innovation becomes widespread due to its intrinsic properties); in the second case, we use the term "model of interessement" (the fate of the innovation depends on the active participation of all those who have decided to develop it). (Akrich et al., 2002: 208) [16]

Akrich et al. view successful innovation processes (including the widespread adoption of the innovation) as results of an alignment of the interests of many stakeholders around the innovation, often by means of adapting the original form of the innovation to fit the different interests stakeholders have. Only when an innovator succeeds in attracting interest in the innovation among many different actors, playing different roles in relation to the innovation, can the innovation become adopted among potential users.

When a social innovation has been made, it is still uncertain if it is useful in other settings than the original one. It has to be tried out, adapted to local conditions and evaluated. Obviously, a process of diffusion of a social innovation involves many steps and is dependent on different types of conditions. Information about the innovation must reach potential users, they must understand the potential of the innovation, they must become convinced about the desirability in trying out the innovation and they must allocate the necessary resources (time, work, money) in order to start making practical experiments with the innovation. Our efforts to find suitable research-based analytical frameworks for studying diffusion processes of social innovations have not been very fruitful, the field seems to be under-researched.[17]

Our experiences suggest that social innovations, because they are embedded in social systems and deal with social interactions, face considerable resistance to diffusion and adoption. It may be easier to evaluate the potential benefits of technical product and process innovations, while the effectiveness of social innovations are more difficult to assess. However, we believe that the resistance to diffusion and adoption may be strongly reduced along certain paths, namely in networks of preexistent trustful relationships between people. It seems that the propensity of potential users of social innovations to devote attention to learning more about social innovations and start experimenting with them is far higher when the champions of the innovations are already known and trusted through previous contacts unrelated to the present innovation.

---

[16] The French concept "interessement" has been left untranslated by authors writing in English, because of difficulties in finding an appropriate translation.

[17] Everett Roger's (1962) classical book *Diffusion of innovations* discussed such an analytical framework, but subsequent work seems to be focussed on case studies rather than theory-building.

The story of how TIP, a method that can be regarded as a social innovation, was introduced in Sweden may be instructive in this regard. TIP was developed in the USA by Sara Ross, in the context of her research with deliberative democracy processes at the Kettering Foundation and then independently. One of us, Thomas Jordan (based in Sweden), got acquainted with Sara in 2000 through an Internet forum for people interested in the work of Ken Wilber, integral philosopher. We corresponded through e-mail on the basis of shared interests in applying adult development and integral theory to political/societal issues. The main reason TIP caught Thomas Jordan's interest at the time, was the ingenuous way in which the method scaffolds the participants' awareness of and possibilities of utilizing different perspectives on complex societal issues. Thomas read up on the method descriptions Sara sent over, and started on a tentative scale to experiment with the method, mainly the part that assists groups in looking at an issue and developing an action strategy through formulating a number of fundamentally different perspectives that could be applied to the issue. At first, these experiments were made with participants in workshops and students at the university of Gothenburg, and not in "live" settings with participants who really were engaged in developing strategies to deal with an issue they were concerned about. The experiments were encouraging: the method seemed to have a considerable effect on participants' views on the issue, as well as on their attitudes towards perspectives quite dissimilar from their own. Four former students who shared Thomas interest in conflict management and adult development gradually developed interest in learning how to facilitate TIP. At this point in time, about 2006, TIP had a feeble foothold in Sweden, in the form of a small group of people who believed in the potential of the method, had started to develop necessary facilitation skills and were in the process of becoming ambassadors for the model.

We then started to think about how to draw attention to the potential of TIP among actors who really need support in developing action plans regarding difficult societal issues: officials in public administration, politicians, NGOs and residents in communities with different kinds of problems. We wrote introductory texts about TIP in Swedish, trying to find a language that would make sense to prospective stakeholders. However, we did not have any readily available channels for reaching decision-makers or other actors who might be in a position to want to try out working with TIP.

The first real opportunity came up when one of us made a presentation of a commissioned report for the board of Gothenburg's crime prevention council. The discussion happened to present an opportunity to mention some aspects of the TIP method. The mayor and some other board members got interested, and asked us to make a demonstration of the methodology at a full-day board meeting already scheduled a few weeks further on. This demonstration convinced the board members that this was a methodology worth more experimentation, and we were asked to do a pilot project in one or two Gothenburg suburbs. This pilot project eventually resulted in Pia Andersson's comprehensive study *Perspektivvandringar (Perspective walks*, Andersson, 2008). Apart from reporting on the pilot groups, the study was written in the form of a manual on how to facilitate TIP and thus the intended readership was mostly potential facilitators. So at this time a well-written and comprehensive Swedish text on TIP was available.

TIP was developed as an approach to deliberative democracy. It was designed to support citizens in developing strategies to address issues they were concerned about in their communities. TIP has been shown to be effective in mobilizing stakeholders' engagement and in facilitating a process that leads to more integrative, more effective strategies for addressing complex issues (Ross, 2007; Andersson, 2008; Inglis, 2011). When we started to plan a research project, we got in touch with an organization that seemed to need exactly what TIP had set out to provide. The Swedish Union of Tenants (hereafter SUT) had a national project called "Uppdrag M," which aimed at developing strategies for involving tenants in the renewal processes in the large metropolitan suburbs in Sweden, comprising high-rise apartment buildings constructed in the 1960s and 1970s. Over time, these suburbs have deteriorated in both physical appearance and in social status. In many of these suburbs a large proportion of the residents are immigrants from troubled parts of the world, for example former Yugoslavia, Kurdistan, the Middle East, Somalia and other parts of Africa. SUT saw a need to develop methods for mobilizing tenants, many of whom lack previous experience in Western-style non-governmental organizations, to advocate their own interests in relation to large property managers and authorities.

At a workshop connected to Pia Andersson's pilot study in a Gothenburg suburb, we met representatives of SUT who were interested in exploring the possibilities of using TIP in their work. We had further conversations with a couple of officials at the regional branch of SUT who proved to be sufficiently interested in our approach to be willing to enter a partnership with us in the form of a joint research grant application. There was at the time (in 2008) an opening for applying for research grants at the Swedish Knowledge Foundation in a special programme supporting research about "societal entrepreneurship." Our application was successful and the project was formally started in the beginning of 2009.

However, even though the fit seemed extremely good between our ambition to use TIP and SUT's need for more effective ways of mobilizing residents in suburbs with a high proportion of immigrants, TIP did not take root in SUT. There were several reasons for this. One was that it turned out that only a minority of the officials of SUT were in favour of working actively with mobilization of suburban residents through presence in the neighbourhoods. The majority favoured a more focussed role for SUT as advocating tenants' interests in relation to landlords. Another reason was that several of the managers and key persons in SUT who supported the endeavour got long-term sick, transferred to other positions or left SUT to work elsewhere. A third reason was that some local representatives of SUT were involved in their own approach to working with residents, and (so is our interpretation) regarded TIP as a competing approach, "not invented here." Looking back it seems we didn't succeed in alleviating these concerns or sufficiently aligning with the work already being done. We spent a considerable time in meetings with stakeholders and the local project leaders in "Uppdrag M," but our approach didn't seem to appeal sufficiently. Thus, we did not succeed in arranging for the action research groups through SUT on the scale originally planned and SUT did not engage in experimentation with TIP as we had expected they would be keen to do. However, through two officials in SUT, not involved in "Uppdrag M," who were involved with projects in other suburbs, we eventually got the opportunity to work with two groups using TIP. These officials could easily tailor the TIP process to suit theirs and our purposes, while focusing on some very concrete topics of concern that had already been voiced in these neighborhoods and which they were looking to engage.

While working hard and spending many hours in meetings with SUT officials with little concrete results in terms of interest in using TIP, another actor turned out to be a more receptive channel for the TIP approach. A group of organizational consultants at a large Swedish organization managing insurance capital on behalf of employers and trade unions, AFA, was in 2009 in the process of starting a three-year project on methods for preventing threats and violence in workplaces. One of the consultants knew Thomas Jordan through participation in a series of training workshops on conflict management and through collaboration in a two-year project on strategies for developing robust collaboration cultures in workplaces. She was somewhat familiar with TIP through participation in a workshop some years earlier and was interested in exploring the potential of the methodology after having read Pia Andersson's report *Perspektivvandringar*. She felt that TIP might be a suitable method for the new project. A series of meetings and workshops eventually lead to AFA adopting TIP as a method in the project, which involved training several of AFA's consultants in facilitation skills. The project had significant good results that have been documented (in Swedish) and are now disseminated through AFA's contact network (which is very large in Sweden). What will come of this we cannot know, of course, the innovation diffusion process is still in an incipient phase.

The story of how TIP was introduced in Sweden fits well into the *interessement* perspective of Akrich et al. Even though there seems to be a good fit between what the innovation has to offer and the needs certain actors have, the adoption process is dependent on the alignment of the interests of many individuals and organizational entities, who are always embedded in their own particular lifeworlds, concerns and trajectories. One conclusion from this story is that it is probably not a successful strategy to look for the best fit between need and innovation and then proceed to try to convince the most "needy" stakeholders that the innovation is what they need. It is more likely that a social innovation will be adopted if champions of innovations use already established contact networks where there is a preexisting trust in competence and motives, even if the fit between the need and innovation is not the strongest possible. We think it is a useful metaphor to think of networks of relationships characterized by a high level of trust as a system of wires with a low level of resistance. Ideas can flow easily back and forth along the wires. Where no previous trustful relationships exist, there are no wires, and hence there is a considerable resistance to be overcome before a flow can start. This means that reaching outside preexisting networks places particular demands on those who set out to spread a social innovation, in terms of acting skillfully to make possible an alignment of different stakeholders' interests. When there are a few keen actors in an organization with many internal dilemmas and conflicts, it is important to carefully gauge the likeliness of a broader interest in the innovation in that context. In our case, we found it was easier to initiate a TIP-process within SUT when there were concrete issues that needed to be resolved and they were actively looking for ways to work on these. It seems important to listen with a keen ear for such issues, which may serve as entry points for the innovation, provided that its sponsors are responsive enough to the needs expressed by the stakeholders. In practice, looking at the example of innovations in the field of scaffolding, this might mean that sponsors/process leaders would arrange a meeting where all relevant stakeholders are present, and instead of presenting the method as such, ask the stakeholders what their dilemmas and goals are, and have an open discussion about which kind of scaffolding might serve those ends. Had we approached SUT in such a way (i.e. used what we below describe as "dialectical meaning-making"), we may have either been more successful in spreading the innovation, or much earlier looked elsewhere for a good fit.

Change Agents Working with Complex Societal Issues

Studying Individual Change Agents/Societal Entrepreneurs

One of the ideas we had when we started our research project on societal entrepreneurship was to search out and interview a limited number of successful societal entrepreneurs in order to analyse their meaning-making structures. This was a minor part of the research project, intended to offer some comparative material. The main study aimed at analysing the transformations of meaning-making among people who were quite inexperienced in developing action strategies for complex societal issues. The interviews with successful societal entrepreneurs could, we thought, provide us with some insight into characteristics of meaning-making that contribute to desired outcomes. We spent quite lot of time to discuss various criteria for the target group. We wanted to find societal entrepreneurs with documented successful outcomes regarding complex societal issues. We came up with the following criteria:

- Successful. The societal entrepreneurships should be successful in a convincing way, i.e. having resulted in sustainable operations or other substantial outcomes.
- Constructive collaboration. The initiatives should be of the kind where it is necessary to establish a constructive collaboration or at least secure support from stakeholders with dissimilar perspectives and/or interests.
- Key persons. There should be a limited number of key individuals who have played decisive roles in the achievements of the initiative.
- Access. The operation or project should be open to the public in the sense that a target group can benefit from the initiative irrespectively of religious affiliation, ideology or resources.
- Innovative. The initiative should have significant innovative elements rather than replicate already existing operations.

When we started to look for initiatives that fitted our criteria, we discovered that individuals that could clearly be seen as successful societal entrepreneurs were actually quite hard to find. This is in itself an interesting result. It seemed there were few individuals, at least in Sweden, who had been successful in achieving significant positive outcomes in complex societal issues.

Reviewing the cases we studied through our series of interviews, as well as our other case studies, we learned that the relationships among meaning-making structures, goal construction, action strategies and outcomes in societal change agency are more complex than we were initially aware of. We realized that it is mostly not possible or meaningful to try to compare how successful are the change agents or societal entrepreneurs with different levels of complexity awareness. A major reason for this is that a person with rather weak complexity awareness will engage in different types of initiatives than a person with a strong complexity awareness. They will find different types of goals and projects compelling, which means that a comparison of their respective strategies and rate of success becomes inappropriate. Someone with weak complexity awareness may be very successful in an initiative that does not require advanced capacities for managing complexity. On the other hand, people with weak complexity awareness will mostly not formulate goals and tasks around influencing complex societal systems or initiating transformative processes among major institutional actors. Similarly, a person with strong complexity awareness is not necessarily more likely to be more successful than a person with weak complexity awareness with an initiative that does not really require an advanced capacity to manage complexity.

We can probably expect that people who on a voluntary basis seek out the role of being a societal change agent will construct their goals and initiatives in a way that is congruent with the level of complexity of their meaning-making structure. However, not all individuals who find themselves in a role where they have responsibility for dealing with a complex societal issue have sought out the role themselves. They may be officials in a public administration or organization, for example, where they have been appointed to be in charge of a task that involves responsibility for managing a complex issue. In such cases, we would expect that individuals with weak complexity awareness will be less successful in achieving significant outcomes than individuals with strong complexity awareness.

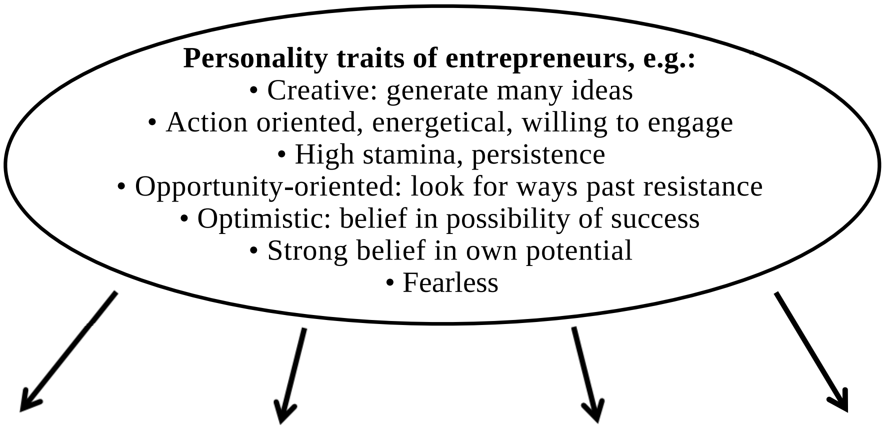
Four Types of Societal Entrepreneurship

During the course of analysing the case studies, three distinctions emerged as potentially significant for classifying types of societal entrepreneurship. The first distinction that seemed relevant to make was between entrepreneurship that aimed at establishing a new operation or carrying out a particular project that serves perceived societal needs on the one hand, and entrepreneurship that aimed at influencing how *other* institutions or established networks operate to serve societal needs. In the first case, the entrepreneurs have a large amount of control over the organization, operation or project they are establishing. They are usually dependent on external stakeholders in issues like funding or permissions, but otherwise they can design and develop their own system. Examples of this kind of entrepreneurship could be starting up a cooperative for reintegrating former drug abusers in the labour market, or carrying out a project for restoring a natural habitat for endangered animals. In the second case, the entrepreneurs' aims can only be attained if they succeed in influencing established systems to change in significant ways, e.g. to get the police to develop better routines for working with honour-related crime, or influencing businesses to develop more environmental awareness in their purchasing strategies.

The second distinction was between entrepreneurs who develop visions about what they want to happen and then proceed to realize those visions on the one hand, and entrepreneurs who are genuinely process-oriented in the sense of focussing on creating favourable conditions for involving diverse stakeholders in co-creation of strategies that inquire into and exploit the room to maneuver that the actual situation offers. This distinction seemed important in order to pinpoint typical patterns of some societal entrepreneurs' approach to their work, and not least to explain the shifts over time that we could see in some of our case studies (Sander & Jordan, 2009, 2011; Emanuelsson, 2011).

The third distinction emerged rather as an afterthought that seemed necessary in order to cover the "lower" end of the spectrum. This distinction is between entrepreneurs whose activities are confined to separate, sometimes spectacular, events on the one hand, and entrepreneurs aiming at developing operations or attaining systemic changes in a more long-run perspective on the other hand.

These three distinctions lead us to define four types of societal entrepreneurship: *event-focused, operations-centered,*[18] *systemic* and *dialectical* (Figure 3). Note that societal entrepreneurs may share the same personality traits, i.e., a typical entrepreneurial personality, but nevertheless practice quite different types of societal entrepreneurship because they operate from different structures of meaning-making (mainly different levels of complexity awareness and perspective awareness, according to this model).



Personality traits of entrepreneurs, e.g.:
- Creative: generate many ideas
- Action oriented, energetical, willing to engage
- High stamina, persistence
- Opportunity-oriented: look for ways past resistance
- Optimistic: belief in possibility of success
- Strong belief in own potential
- Fearless

Event-focused societal entrepreneurship	**Operations-centric** societal entrepreneurship	**Systemic** societal entrepreneurship	**Dialectical** societal entrepreneurship
• Isolated concrete ideas • Sometimes impulsive character • Short time horizon, limited perseverance • Somtimes motivated by desire for personal place in the limelight • Hoped-for outcome: successfully realized event that gained widespread attention	• Aims at serving a public need or solve a societal problem • Focus on establishing an operation or carry out a project • Time horizon often about 1-3 years, even if the goal is to establish a permanent operation • Hoped-for outcome: an operation that serves its aims well or a project that attained its goals	• Aims at attaining changes in the way parts of the societal system operates (e.g. educational institutions, labour market, social services, decision-making processes in public admininstration) • Long-term orientation due to ambition to change structures with a considerable inertia • Develops strategies involving persuasion, demonstrating viability of ideas, development of plans and policies • Hoped-for outcome: systemic change	• Aims at contributing to the realization of the potential for positive societal change that is present in a particular context. • Strong process orientation, creates forums for genuine dialogue among diverse stakeholders • Working with stakeholders' perspectives in a transformative way is a prominent element • Inquires continually into the need for reevaluating own perspective • Hoped-for outcome: transformative processes

Figure 3: Four types of societal entrepreneurship

---

[18] Operations-centered societal entrepreneurship as a concept overlaps almost completely with the more commonly used term "social entrepreneurship," even if the aspiration is to contribute to societal betterment by building a particular operation. It is a bit awkward to coin a new concept here, but we think the juxtaposition of the four subtypes of entrepreneurship aspiring to contribute to the social/societal good is clarifying.

Event-focused societal entrepreneurship is characterized by the focus on staging single events. One type of event-focused societal entrepreneurship involves spectacular events, where the motivation driving the entrepreneur is to have fun, do something personally satisfying and possibly place him- or herself in the limelight. A person has an exciting idea about something that could be done, and proceeds immediately to try to realize the idea. The idea usually involves something quite concrete that can be staged in a near future with resources that happen to be available or can be mobilized quickly. The societal utility of the idea is in this case more a necessity for earning acclaim from the public, rather than the actual driving motive of the initiative. Another, more common type of event-focused societal entrepreneurship is when individuals or groups arrange single events, like a fund-raising concert for charity. Event-focused societal entrepreneurship has a short time horizon and does not involve complex work building an organization or planning a long-term project with different phases. The strategies used often involve arousing enthusiasm among others for a stimulating idea, cajoling decision-makers to make resources available and using trial-and-error experimentation to develop a way to realize the vision. Event-focused entrepreneurship is often fragmentary, focused on realizing single events that are not part of a long-term plan, and the results are seldom lasting.

Operations-centered societal entrepreneurship (= social entrepreneurship) involves people who have perceived a problem or need in the society that ought to be solved/served or have developed a vision about an operation or a project that would enrich the society in some way. Focus is on realizing the idea by establishing and managing one or several operations that serve the needs of a particular group or by carrying out a project that results in certain events, plans or artefacts. In order to attain the goals, the societal entrepreneur needs to mobilize resources, get necessary permits and establish an operation or project organization. However, operations-centered societal entrepreneurship involves developing a new operation or a project, relatively independent of already existing institutions and structures, which means that there is a large measure of autonomy in designing and managing the operation. These types of initiatives often have a certain linear character: an idea is formed, plans are developed, resources are mobilized, an operation or a project is established, which result in more or less successful outcomes. The time horizon is often one to a couple of years. Some operations-centered societal entrepreneurship initiatives are pure projects: when the plans have been realized, the project is completed and the entrepreneur starts to develop a new project. In other cases the initiative is intended to create a long-lived operation, such as a cooperative.

Systemic societal entrepreneurship is distinguished by its ambition to influence how *other* actors and systems operate, e.g. administrations, authorities, businesses and networks of different entities. The societal entrepreneur has identified some type of unsatisfactory state of affairs or a lack of something that ought to exist, or has a vision about how the society could be better if established societal institutions or systems change in terms of priorities, methods of working or structures. The systemic societal entrepreneur usually has a rather elaborated narrative about what is wrong or wanting in society and what needs to happen and how. The strategies used involve formulating visions, persuading decision-makers about the desirability of one's own ideas, and trying to prove, e.g. by pilot projects, the viability and desirability on doing things differently and better.

Dialectical societal entrepreneurship is characterized by a strong process orientation, involving not only strategies and actions, but also goal formulating. The foundation is a commitment to a certain problematic or to certain values, but the dialectical societal entrepreneur is careful in not going too far in specifying goals, visions and strategies. Focus is on establishing good working relationships with relevant stakeholders, and invite them to participate in genuine dialogues with a large measure of openness to the ideas, learning, needs and possible synergies that are discovered and developed when different points of view and interests meet and interact in a creative process. The worldview of dialectical societal entrepreneurs is based on a keen awareness of the complexity of the context one operates in, which has its own structures, conditions and ongoing processes that present both restrictions and opportunities that need to be discovered in order to find a navigable course. Strategies used involve reviewing and revising one's own perspective, visions and conceptions about desirable goals, as well as creating forums for creative and integrative meetings between different perspectives.[19]

Dialectical societal entrepreneurship is different from the other three types in one significant way: it has a genuinely dialogical orientation, whereas the other three can be described as *monological*. "Monological" here means that the actors are embedded in *one* perspective, their own. This perspective is perceived as the most correct, most relevant perspective. The environment is perceived and evaluated from within one's perspective. Issues and events are given meaning in terms of one particular narrative, one set of values and beliefs. Goals and strategies are formulated in the terms and conceptions of this point of view, and therefore get a monological rather than dialogical character. A monological worldview leads to a dualistic approach: my/our perspective is pitted against other perspectives, which are viewed as opposing or at least as obstacles to the implementation of already formed and elaborated goals, measures and strategies. A monological mindset is monological because of a weak awareness of perspectives as variables. One does not perceive one's own perspective as variable, as a system that is likely to change through the insight gained when comparing and possibly integrating different perspectives. A dialogical approach is a natural outcome of strong perspective awareness, where there is an awareness of the properties of different perspectives and of how these properties have consequences for perception, interpretation and evaluation of different issues. If one has a monological mindset, one often has a tendency to try to convince others of the correctness of one's own views, prove to them that they have to change their mind, or put pressure on them to accept one's own ideas. With a dialogical mindset, the natural approach is to have an inquiring and openended attitude, curious about what will emerge when all parties have gained a deeper understanding of each others' conditions, views and interests. The dialectical characteristic shows up in the routine expectation of the necessity for multiple parties to articulate, reflect on and then to coordinate their multiple perspectives into some kind of synthesis appropriate for the matter at hand.

It might be in place to point out that there is no straightforward relationship between types of societal entrepreneurship and the likelihood of successful outcomes. Societal entrepreneurs in all four types can be very successful, but the *character* of the initiatives they engage in tend to be quite different. It is consequently unlikely that an event-focused societal entrepreneur would even engage in initiatives that aim at achieving significant systemic changes or contributing to transformations of the perspectives of stakeholders in different organizations.

---

[19] See the next section for a more comprehensive discussion of dialectical meaning-making.

Dialectical Meaning-making and its Consequences for Entrepreneurial Action

In this section we will take a closer look at the characteristics of dialectical societal entrepreneurship. First we need to give a little background by relating how our present conception evolved. The case studies we made presented a number of examples of a certain pattern of meaning-making and action that took different forms in different cases, but seemed to share a common underlying logic. One of the more obvious pointers to such a pattern was that a number of the change agents Jordan interviewed in one of the earlier research projects (Jordan, 2006a) used quite similar words for describing their own role in the change processes: *catalyst, enzyme, match-maker, midwife.* These words/metaphors seem to have in common that they point to a worldview where the self is seen as an active agent in a complex environment which has already a lot of structure and processes going on that one maybe can influence, but not unilaterally control or program. We sought descriptors that fit the pattern we intuited was there. We found that Michael Basseches's framework (1984) for describing dialectical thinking is very helpful for pinpointing and explaining the observable patterns in the case studies.[20] Basseches identified a large number of dialectical "schemata," or "thought forms" in interview transcripts. He organized them into three categories: motion (or process), form (or context) and relationships.[21] Drawing on both theoretical frameworks (see Jordan, 2011) and our case material, we have adapted Basseches's framework somewhat in order to point out salient features of the worldview that generates dialectical societal entrepreneurship. According to this conceptualization, five types of awareness characterize dialectical meaning-making.

A person with strong ...

... *complexity awareness* expects (has a pre-understanding) that phenomena usually are caused by complex conditions and causal relationships (linear, mutually conditioning factors and systemic) and that it is often very useful to inquire into and gain knowledge about causal relations and possible consequences. People with strong complexity awareness therefore actively engage in seeking out knowledge and insight about issues relevant to their aspirations. This propensity to expect that there are significant things to be learned and to start looking for a deeper understanding of underlying causal relations is, according to our experience, often absent among people with a weak complexity awareness.

... *process awareness* notices and seeks understanding of the character of ongoing change processes. Everything is seen as embedded in processes that change conditions over time. There is also a strong process orientation, in the sense of expecting that the process of dialoguing and acting will lead to new insights, ideas, assessments and intentions. There is an openness and even positive expectations regarding testing and transforming own assumptions and views. People with strong process awareness often find it important to create spaces where inquiry, discovery and generative dialogues become possible.

---

[20] Later Barrett Brown's (2011) doctoral dissertation confirmed many of these patterns, even though Brown used a different investigation strategy and a somewhat different conceptual framework for analysing societal change agents.

[21] A fourth category, transformation, comprised those schemata that combined several schemata from the other three categories.

... *relationship awareness* notices properties and processes in relationships, in relations between people as well as relations among phenomena of other kinds. Someone with strong relationship awareness actively engages in establishing relationships and influencing their qualities in order to make constructive interaction possible. This includes taking care to act with an attitude that invites contact, trust and respect.

... *context awareness* reflects on how particular issues are embedded in a larger context that has its own properties and processes. No phenomenon exists separately, but is in sometimes insidious ways conditioned by the properties of the context in which it is embedded. Systemic qualities, such as organizational structures and their consequences, culturally constructed norms and behaviour patterns, economic mechanisms and power structures are noticed and considered. People with a strong context awareness often develop strategies that either exploit the room to manoeuver present in an otherwise constraining context, or aim at influencing and changing how that context is structured and operates.

... *perspective awareness* notices and seeks insight into the properties of the perspectives different actors use in order to make sense of themselves and their environment. The meaning of events and issues is dependent on the properties of the perspectives used to perceive and interpret them. Perspectives are seen as a variable that can potentially be influenced and transformed, which goes both for oneself and others. A person with a strong perspective awareness therefore often seek ways to make the properties of perspectives conscious and to create favourable conditions for developing perspectives, not least by *using* the tension between different perspectives for new insight and integrative strategizing.

We found that this framework captures many significant qualities among several of the societal entrepreneurs we studied. In some cases where we could trace development over a longer time, we could discern a movement towards a more dialectical way of meaning-making and acting (Sander & Jordan, 2009; 2011; Emanuelsson, 2011). However, it also became apparent that a person might make use of a dialectical approach in one or a couple of domains, while not applying the same sophisticated approach in other domains. We have begun, tentatively, to identify different domains that are relevant to societal entrepreneurship. Doing this, it is apparent that very different time frames are involved. Some people have a strong dialectical orientation in their way of engaging in conversations, for example with clients, stakeholders or in meetings. Here the time frame is from seconds to hours. Other domains, with a longer time frame, can be problem-solving processes (minutes/hours/days), team leadership and project management (weeks/years), establishing an operation or organization (years), or managing a systemic change initiative (months/years). Another type of domain is the relationship with oneself, where the time frame varies from seconds to decades.

In Table 5, we have outlined the consequences dialectical meaning-making can have in three different domains: conversations, systemic change initiatives and oneself. We believe this is a promising field for inquiry through future case studies.

Table 5: Dialectical meaning-making in three domains

	In conversations	**In systemic change initiatives**	**In relation to oneself**
Complexity awareness	Expects that there are conditions and causal relations that one has no insight into yet. Uses conversations to elicit information and develop knowledge.	Knows that organizations and change processes are so complex that it is unrealistic to expect that one can make detailed plans and then proceed to implement a fixed solution. Engages change initiatives with an inquirying approach, where development of knowledge and insights is a key ingredient.	Regards oneself as a complex being with many unknown or vaguely known aspects. Uses experiences actively to develop more self-knowledge.
Context awareness	Keenly aware that the person one has the conversation with is part of a larger context with its own structures, norms, rules, narratives, culture and larger ongoing processes.	Aware that the context has its own structures and processes that both present constraints and creates opportunities. Standard solutions not adapted to the specific state of the actual context are not regarded as particularly helpful.	Seeks understanding of how one's own reactions and actions are conditioned by the properties of the context one is embedded in: organizational structures, cultural patterns, position in a complex system.
Process awareness	Regards the conversation as a genuinely openended process. No fixed conceptions of what is to be the outcome, but has an open attitude to what might come out of a dialogue. Wants to toss around thoughts and ideas and see what emerges.	Expects change processes to be genuinely openended processes that cannot be program-med in a detailed way in advance. Has a long-term perspective and seeks understanding of the nature of various long-term change processes and their possible consequences.	Thinks of oneself in the present moment as embedded in ongoing processes of change: where do I come from, in what direction am I heading. Identifies oneself *as* a process rather than in terms of a number of fixed properties or a fixed personality.
Relationship awareness	Keenly aware that the conversation is embedded in a relationship that is created and changed through the conversation itself. Acts consciously to create an appropriate relationship, e.g. by working on establishing trust.	Reflects on how different elements of complex systems and processes are mutually dependent and shaped by the character of the relationships they have with each other. Searches for stakeholders with whom it is possible to establish productive relationships. Acts consciously to influence tha properties of relationships, among people as well as among different parts of systems.	Experiences the own self and own reactions as embedded in and conditioned by the properties of the relationship one has with others. Takes responsibility for own role in the development of relationships with others.

	In conversations	In systemic change initiatives	In relation to oneself
Perspective awareness	Seeks understanding of the perspective, reasoning patterns and narratives of the other. Uses the conversation to test the relevance and properties of one's own perspective and narrative. Makes efforts to create a conversation that opens up the potential for mutual transformation of perspectives.	Strongly aware that different perspectives generate different views on goals, strategies, priorities, etc. Seeks to create forums and processes where different perspectives can be constructively articulated and their differences can be mobilized for greater insight and creativity. Seeks to create processes that facilitate insight into and transformation of perspectives.	Uses experiences actively in order to become more aware of, test and transform one's own perspective. Develops strategies to develop one's own perspective. Seeks out challenging feedback in the interest of becoming aware of blind spots and alternative points of view.

Trajectories of Development of Awareness

In three of our case studies, we have been able to follow or retrospectively reconstruct the change agents' processes of learning and development of awareness over 5-10 years. While we have just a few cases to rely on, the analysis points to some patterns that are suggestive and certainly worth further inquiry.

One of the thoughts we had when we started exploring the relationship between meaning-making, patterns of action and outcomes among societal change agents was that a strong complexity awareness would *lead* to a process orientation, to interest in inquiry and learning and to an interest in working towards systemic change, whereas a weak complexity awareness would lead to a more limited conception of aims and strategies and a propensity to develop own ideas and visions and then try to implement them, rather than co-develop ideas and strategies in interaction with a broad set of stakeholders. However, we have had to revise this assumption in the light of the case studies we have made. It seems that our own complexity awareness regarding the relationship between complexity awareness and an inquiring orientation was rather weak. The relationship is certainly not linear and unidirectional, but more complex. In some cases it seems that a basic inquiring orientation came first, and the complexity awareness increased as a result of reflecting on experiences, which in turn strengthened the commitment to a process orientation, and so on.

In one particular case study (Emanuelsson, 2011), it is apparent that the societal change agent we interviewed started out with a strong sense of urgency regarding a particular issue: violence and abuse among school children and youth. The engagement with this issue later evolved into a focus on developing better strategies for preventing and managing honour-related violence towards immigrant youth and adults. Our interviewee describes her own propensity to even think about underlying causal mechanisms as very weak in the beginning. She and her colleagues didn't reflect very much about the complex causes and conditions behind youth violence, but rather started to initiate meetings and initiatives without having a very clear understanding of the problem complex. However, she could describe three key experiences where she was exposed to systemic explanatory frameworks relating to different types of violence as well as to the resistance among stakeholders to engage the issue. These experiences had a profound impact on her meaning-making, in the sense that she felt that new levels of understanding of the underlying logic behind the problematic phenomena opened up for her. The new insights lead to experimenting with other kinds of action strategies as well as redefining goals in accordance with what she now felt was more important to strive for. In this particular case, it seems reasonable to see the change agent's basic openness to learn from experience and her receptiveness to explanatory frameworks as the key factor in developing a more comprehensive and sophisticated strategy for societal change agency.

In the beginning of our project, the project leader had a more static perspective on the role of meaning-making structures for variations in societal change agency, focussing on the relationship between the level of complexity awareness on the one hand, and the type of action strategies on the other hand. But it seems that complexity awareness may rather be the consequence of an openness to learning, than an independent variable explaining variations in goal construction and action strategies.

Conclusion

Reviewing our learning over the last seven years, we feel that we have only begun to explore a number of arguably very important issues. The potential for further and more systematic research in this field seems very large indeed. We believe we could benefit from a better understanding of how people participating in efforts to address complex issues differ from one another in their needs for scaffolding, as well as how facilitators can be effective when working with groups where participants have very different scaffolding needs. A better understanding of what functions various change methods actually serve might give us more clarity about the differences and similarities among methods, techniques and more general approaches and thus allow us to choose and adapt scaffolding elements more skillfully. In the course of our explorations, we have come to respect the difficulties involved in facilitating group processes. Not much empirical research seems to have been done on actual moment-to-moment facilitation of groups working on complex issues (one example is Papamichail et al., 2007). We do hope to see more of such research in the future.

Regarding individual change agency, there is a lot to explore about the roles complexity awareness and perspective awareness play when engaging complex issues and visions. We have little to say so far about the question of to what extent individual skills necessary for change agency in complex processes can be acquired by anyone interested in the task, and what kind of scaffolding is effective in supporting such skill development. The typology of four types of societal entrepreneurship presented here should be regarded as tentative, and further empirical studies will show whether the distinctions are fruitful for understanding the diversity and learning trajectories of societal change agents.

The Dynamics of Marriage Law and Custom in the United States

Elizabeth Ann Wilson Whetmore[1]

Abstract: This article examines changes in marriage laws and related cultural norms and values in the United States across the last several decades, and discusses correlating worldview shifts. It appears that the "traditional" worldview produced earlier laws, cultural norms and values, and changes to these have corresponded with a cultural worldview shift, first into "modernism" and then towards "postmodernism." The implications of these worldview shifts for ongoing change to marriage law and custom are also analyzed.

Keywords: Cultural lines of development, feminism, gay marriage, integral, law, marriage custom, marriage worldview, modernist, postmodern, teen pregnancy, traditional, worldview paradigm.

Introduction

Over the last several decades, marriage laws and customs within the United States have changed dramatically. For example, not long ago, it was relatively common for females to marry in their mid-teen years (Moss, 1964).[2] Now, most states do not allow couples to marry without parental consent until both are at least eighteen (USLegal, 2012). Additionally, only a couple of decades ago, it was both common and socially acceptable for males in their twenties to date females who were between 16 and 18 years of age. Now, statutory rape laws in several states make it possible for a man as young as 18 to be prosecuted for having consensual sexual relations with his girlfriend if she is less than 18, with penalties being harsher if she is more than two years his junior.[3] At the same time, "dating" as a form of courtship for young people, has

---

[1] Elizabeth Ann Wilson Whetmore, PhD (aka Annie Whetmore) uses "integral " as a framework in her studies of and writings about: feminist theory; family and marriage law; political culture in the U.S.; democracy, communication and compromise; and teaching methods and student engagement in higher education. She also develops courses specifically based on the "integral operating system," such as an applied-techniques, skills development course titled "Political and public sector leadership." Annie was 39 years old and had four teenage children when she started college as a first-time freshmen. She obtained her PhD from Texas A&M University in 2007. She is currently an assistant professor at California State University, Dominguez Hills. She lives in Long Beach, California with her husband, Edd Whetmore, who is also a professor at Cal State Dominguez Hills.
awilson@csudh.edu

[2] Also, although prior to the 1950s the average age that females married was older, my own grandmother and great-grandmother were both married at the age of 16. In the 1950s, teenage marriage numbers spiked. Although the numbers soon lowered again, as late as the 1970s I knew of several girls between 15 and 17 years old who were getting married. In the rural area where I grew up, this was still an accepted practice at that time.

[3] For most states, the statutory "age of consent" falls between 16 and 18, but laws vary state to state. For example, in both California and Mississippi, it is against the law for any person who is 18 or older to have

SOME RIGHTS RESERVED

begun to disappear. Today, both males and females in the U.S. are more likely to have casual sexual relationships, with partners close to their own age and without an intent for commitment, well into their twenties (Wilson, 2009). Because women tend to marry men who are older than them, and because males have, in the history of the U.S., been more likely than females to wait until their mid to late twenties to marry for the first time, these new dating norms may have helped to push the average age at time of first marriage higher for American women.[4] Not long ago, many young women encountered family and social pressure to marry young. Now, teenage marriage is largely seen as scandalous and damaging to youths, particularly to young women.[5]

In addition to these age-related changes, the legal structure of marriage has changed as well. Over the last several decades, as the nation's cultural attitudes have shifted, marriage laws that had once perpetuated a male-over-female hierarchy were re-written to give women rights more comparable to those enjoyed by their husbands. Marriage laws were also changed to make it easier for couples to seek divorce.[6] In the meantime, part of the dialectic force behind these changes may have helped to bring about a partial cultural rejection of marriage itself. That is, during the mid-twentieth century, many feminist writers demonized the institution of marriage as being inherently demeaning to women (for examples, see Firestone, 1970 and Dworkin, 2002). With so many cultural and legal forces in play, the direct impact of this dialogue is impossible to

---

sexual contact with anyone who is not yet 18. However, in California, the crime may be reduced to misdemeanor status if the distance in age is less than three years, yet in Mississippi, age difference does not matter. Similarly, in Connecticut, a person can be charged with a felony for having sexual contact with someone who is less than 16 years old only if the offender is more than two years older than the victim. Yet in Kansas, where the age of consent for sexual conduct is also 16, distance of age does not matter. Although most state's laws refer to "any person" rather than "any male" over 18 who has sexual relations with a younger person as being guilty of committing a crime, the U.S. Supreme Court, in Michael M v Superior Court, 450 U.S. 464, 1981, upheld the Constitutionality of state laws which hold stricter rules for males than females, on the grounds that females can get pregnant while males cannot. See Richard Posner and Katharine Silbaugh, A guide to America's sex laws, 1996.

[4] The average age of first marriage has not changed much across the last century for males. In 1890, the average age at first marriage for males was 26. This number declined slowly in the early twentieth century, to reach an all-time low in the 1950s and 1960s of an average age just shy of 23. By 1990, it was back up to 26, and today stands at 28. For women, the average age at first marriage, in 1890, was 22. This number declined slowly in the early twentieth century, to reach an all-time low in the 1950s and 1960s of an average age just over 20. By 1980, it was back up to 22, and has steadily risen since. Today the average age for women at first marriage is 26. Tables may be viewed online at the "Info Please" database compiled by Pearson Education, 2011. Also see National Public Radio's (NPR) online chart titled "Marriage in the U.S.," 2011.

[5] Recall the scandal, played out in the media, over the fundamentalist Mormon families that were taken into state custody in Texas in 2008. It was not only the notion of polygamy that appalled people, but the worry that some of the wives might be "underage." In fact, this concern was touted as why Texas placed some of the children and young women into state custody. See R. Owens, "Polygamist sect marks first anniversary of Texas ranch raid," 2009.

[6] For discussion of divorce law prior to and during the mid-twentieth century, see Weitzman, "Women and children last: The social and economic consequences of divorce law reforms," 1988, and Okin, *Justice, gender, and the family,* 1989. A discussion of the Family Law Act of 1996 and contemporary divorce law can be found in Douglas et al, "Safeguarding children's welfare in non-contentious divorce: Towards a new conception of the legal process?" 2000. See also Baer, *Women in American law: The struggle toward equality from the New Deal to the present*, 2002.

measure. Nonetheless, a general attitudinal change is evident. A few decades ago in the U.S., marriage was culturally exalted by both men and women of all ages.[7] Today it enjoys far less social prestige. A growing percentage of heterosexual couples cohabitate before or instead of getting married, and since the 1950s, the rate of divorce has increased almost steadily, while the likelihood that women will remarry has declined (Bramlett & Mosher, 2002). Meanwhile, a majority of U.S. women still become mothers.[8] This has increased the number of single-parent families and contributed to what economists call the "feminization of poverty" (Pearce, 1978) – the fact that most poor, single-parent families are headed by never-married or divorced women has left them with less social power and economic security than they might have otherwise enjoyed.

At the same time, however, the increasing numbers of unmarried men and women helped to drive a further cultural shift as society as a whole began to respond to this new social phenomenon with greater awareness of and toleration for, lifestyles that had once been shunned. Single mothers, for example, are no longer cut off from social power simply because they are single. Cultural and legal acceptance of marriages that do not conform to old social restrictions have also expanded. For example, in the U.S. today, the idea that a couple could be denied the right to marry simply because they are not both of the same race seems unthinkable to most people.[9] And, while it is still against the law in most states for gay couples to marry, acceptance of homosexuality and gay rights in general has broadened (Brewer, 2003; Brumbaugh, 2008). Now, all states grant gay couples domestic partnership rights, and an increasing number of states allow them to legally marry.

These many rapid shifts in predominant cultural values and in marriage law have resulted in worldview clashes, individual confusions, and political fireworks as pressure mounts to either further or reverse the changes. In an attempt to facilitate improved understanding of these dynamics, I will discuss what I refer to as the three predominant worldview paradigms evident in the United States today. Using a holistic approach, I weave together findings from other scholars' empirical research, various philosophical and theoretical ideas, including my own, and meta-ethics concepts.[10] I then distill some of these ideas into simple charts, which can, hopefully, allow for better understanding of how some integral theorists' concepts and meta-ethics concepts intersect with what feminist theorists have claimed, what political scientists have empirically measured and what anecdotal evidence suggests. This, in turn, can open new areas of study as we are able to pinpoint areas where knowledge is lacking. It may also help political activists and policy-makers to better understand the populations they attempt to lead.

---

[7] For example, in the mid-1950s, less than 10 percent of American's believed that a single person could be happy. See Stephanie Coontz, *The way we never were: American families and the nostalgia trap*, 1992.

[8] For example, a 2005 vital statistics study found that only 42 percent of women ages 15 to 44 were childless, and the majority of those considered themselves to be "temporarily childless," that is, they planned to have one or more children in the future. See Chandra et al, "Fertility, family planning, and reproductive health of U.S. women: Data from the 2002 National Survey of Family Growth," 2005. In addition, during the last two decades of the twentieth century, while the birthrate among teens of color dropped, the birthrate among white, single, middle-class women increased. In 1990 more than 170,000 single women older than 30 gave birth. See Bock, "Doing the right thing? Single mothers by choice and the struggle for legitimacy," 2000. Finally, in the last decade, births to unmarried teens have remained close to constant, while births to unmarried women twenty and older have continued to steadily rise. In 2007, nearly four in ten births in the U.S. were to unmarried women. See Ventura, "Changing patterns of nonmarital childbearing in the United States," 2009.

[9] For example, in a 2001 survey, biracial couples reported widespread tolerance and even acceptance of their relationships. See Fears and Deane, "Biracial couples report tolerance: Survey finds most are accepted by families," 2001.

[10] For a definition of and operational concepts for "meta-ethics" see Ting-Toomey and Chung (2005).

Previous Research and Theory – Marriage

In the United States, literature about marriage has tended mostly to follow one of three threads. The first thread, forwarded in earnest by mid-twentieth century feminists (see below), argues that marriage was instituted by male-led society to coerce female sexual and caregiving behavior in ways that are desirable only to males. The second thread, forwarded by political conservatives and various religious groups, predominantly argues that marriage is a moral necessity for heterosexual couples and a societal necessity for the raising of children in stable households (see Feld et al, 2002; Wilson, 2002). The third thread, often embraced by those arguing legal cases in favor of legalizing same-sex marriage, follows the popular societal notion that marriage is a desirable "expression of romantic love," decisions about which must be left to individual choice if citizens are to be free to pursue their own happiness in life (Murray, 2012, p. 3). Few attempts have been made to reconcile these disparate views about marriage, ask what effects they have had on American law and culture, or even ask why we have three contradictory views about marriage in the first place. Yet to do so seems vital to an understanding of the rapid changes in marriage law and custom that this article addresses. My first steps in that direction, then, will begin with a brief review of feminist literature about marriage.

Radical feminists argued that marriage was little more than a license for men to sexually abuse their wives (Brownmiller, 1975; Dworkin, 2002). Other feminists argued that "mothering," and caregiving in general, was bad for women, and charged that the traditional mother-child relationship created and maintained male dominant societies (Chodorow, 1979; Meyers, Ed., 1997; Trebilcot, 1984). They therefore opposed the traditional husband/wife/children family unit, and encouraged women to remove themselves as far as possible from their stereotypical roles. Liberal feminists also argued that marriage and divorce law strongly favored men, and that women must be legally recognized as autonomous individuals even when married, rather than as simply under the legal jurisdiction of their husbands (Brennan & Pateman, 1979; Pateman, 1988).

Feminists also criticized the family economic unit that traditional U.S. marriage established. Marriage in the U.S., as it existed prior to relatively recent legal changes, afforded the male political and economic authority as the legal "head" of the family. In this assumed role, the male entered the political world as part of a "new economic unit," separate from previously existing families ((Brennan & Pateman, 1979, p. 186). No equal privilege was granted to the married female. In fact, wives were expected to become economically dependent upon their husbands if the family units' finances allowed for them to do so. And, if both husband and wife had to work to support the family, the wages earned by both were usually considered to be "pooled resources" (Okin, 1989, p. 140), which were then controlled by the husband. Similarly, Judy Baer (1978) addressed male-favoritism in the market, which was supported and enhanced by laws that purported to "protect" women while actually limiting their ability to compete with males in the workforce. According to Baer (1978; also Eisenstein, 1984), these laws limited women's public-sphere liberties without affording them any real benefits in exchange. In sum, these feminists argued that U.S. law had *coerced women into caring for others* by blocking their access to the "public sphere"[11] (also see Okin, 1979 and Elshtain, 1981) and, therefore, to economic independence.

More recently, feminist critique of American laws, while quieted to some degree, have nonetheless continued. For example, in spite of the legal changes that occurred during the second half of the twentieth century, most of which favored women, Baer (2002) commented that, while some important legal strides had been made, women in general were no better off now than they had been decades before. Similarly, Josephson (2005) compares feminist views about marriage to contemporary argument about same-sex marriage. She acknowledges that much has changed over the last few decades, but asks how much women have really benefitted from this change. She argues that "social change is a double-edged sword" (p. 276) because changes in marriage law and custom have both helped and hindered women. Finally, in her article which follows legal arguments in favor of marriage rights for same-sex couples, Murray (2012) reminds us that marriage has historically been used as a coercive tool and even as punishment for "the crime of seduction" (p. 5). She states that "recognizing and acknowledging marriage's disciplinary qualities" allows for "a more accurate depiction of marriage" (p. 65).

Josephson (2005) also argues that we need "extensive discussions regarding the public purposes of marriage" (p. 277). Her primary thesis, though, is about citizenship and how it is affected by the right to marry, the lack of the right to marry, or by the form and intent of marriage law. My project, on the other hand, examines the dynamic interaction between changing marriage law and changing social norms, and how these manifest within what I call shifting "worldview paradigms."

Previous Research and Theory – Worldviews

According to contemporary research and theory, there are multiple stages of worldview development that individuals pass through (Manners and Durkin, 2001; see also Cook-Greuter, 1990 and Kegan, 1982). Clare Graves, whose work was published by Don Beck and Christopher Cowan (1996), believed that cultures followed a similar pattern of worldview change and development, although much more slowly. This would occur because, as individuals move through their own stages of development, "they find points of commonality and mutual understanding that manifest as distinct cultural structures" (Brown & Riedy, 2006, p. 5). The integral framework, as articulated by Ken Wilber through numerous books (e.g. Wilber, 1995, 1996, 2000, and 2006), indicates that development occurs in all four quadrants of human experience (Table 1). These quadrants are the "interior individual" or "intentional" quadrant (upper left), the "interior-collective" or "cultural" quadrant (lower left), the "exterior-collective" or "systems" quadrant (lower right), and the "external, singular" or "behavioral" quadrant (upper right). If Wilber is correct, an examination of development and change as it occurs within all four quadrants is essential to a holistic understanding of human interrelational dynamics. In this context, clearer understanding of cultural worldview shift within the U.S is needed if we wish to understand the nation's ongoing changes to marriage law and its ever-present political dynamics.

---

[11] For explanations of the "public/private split," see Arendt, *The human condition*, 1958, and Davidoff, "Regarding some 'old husbands' tales': Public and private in feminist history" 1998, p. 165.

Table 1. Four Quadrants of Human Experience

Interior-Individual Intentional: Thoughts, emotions, etc.	Exterior-Individual Behavioral (physical), & the biological body
Interior-Collective Cultural: customs, social mores, etc.	Exterior-Collective Social & Political Systems

Certainly, worldviews within cultures can be graphed, revealing cultural-majorities who primarily adhere to given worldviews at that particular point in time. For example, Evans (1997) challenged the "culture wars" notion (Hunter, 1992) that there were only two major worldview value-systems within the United States and that these two formed the roots of all groups' social and political values. While Evans did find evidence of two worldviews, those two could not explain all of the variance that he found in values with his extensive surveys. The introduction of a third worldview, along with an understanding that these three overlap each other and that most individuals draw from more than just one, could explain the discrepancy that he found in the data. The extensive research performed by Ray and Anderson (2000) supports this notion that a third worldview value-system exists. That there is a majority "center" group ("moderns" according to Ray and Anderson) continues to be supported by extensive research (see Fiorina, 2011), although the worldview values of this center group have thus far been difficult to pinpoint.[12]

According to Ray and Anderson (2000), in the 1990s, approximately 25 percent of Americans could be classified as "traditional," 51 percent were "moderns," and 24 percent were "cultural creatives," herein referred to as "postmoderns" (also see McIntosh, 2007, p. 67). I refer to these three as "traditional," "modernist" and "postmodern." I borrow these terms from Steve McIntosh (2007). Beck and Cowan (1996) referred to these worldviews are "truth-force," "strive-drive," and "human-bond."[13] Western political theorists know the terms for these worldview paradigms as ancient, modern and postmodern. However, "traditional" is the term used by some right-of-center politicians in the U.S. today to describe their own ideology.[14] It also seems to be a better descriptor than "ancient" for a set of views that in many ways parallels those of the ancient philosophers but has nonetheless developed and changed across time. For example, some "ancient" ideas, such as that slavery is both natural and morally acceptable, have been rejected. Yet other ancient ideas, such as that, within marriage, a male over female power hierarchy is natural, biblically ordained and unavoidable, is still embraced within the traditional paradigm. Finally, the term “modernist” is borrowed from Steve McIntosh, who has written about these worldviews before, and uses the term “modernist” rather than “modern” as this helps to establish the term as distinct from "contemporary.”[15]

---

[12] Modernist values are difficult to pinpoint in much of this research because survey questions tend to gauge left-right political positions, which do not effectively measure modernist values. As the predominant worldview paradigms in the U.S. become more understood, survey questions could be developed which do a better job of measuring percentages of adherents to particular value sets and of tracking paradigmic worldview shifts.

[13] In Beck and Cowan's color chart, traditional is blue ("truth-force"), modernist is orange (strive-drive) and postmodern is green (human-bond). Wilber uses amber instead of blue, but orange for modernist and green for postmodern are the same in the Wilber model.

[14] For example, Sarah Palin describes herself as a "traditional." For discussion of her use of this term, see Talbot's "Red sex, blue sex," 2008.

While this work by Evans (1997), Ray and Anderson (2000), and Fiorina (2011) does not cover a long enough time span to empirically measure more than a small a snapshot in time, various theoretical models have tried to map what appears to be lasting change, or development, that has occurred across time. Beck and Cowan (1996), McIntosh (2007) and White (2010), for example, have referred to a “spiral” of socio-political development. Beck and Cowan (1996) refer to the cyclical nature of the development as “life cycles,” and each new, distinct or “higher” level of development as another “vMeme” (value meme). McIntosh (2007) refers to the cyclical nature of development as one of differentiation, integration, differentiation. He refers to each new, distinct or “higher” level of development as another “worldview.” White (2010) describes a two-dimensional “crisis cycle” model, and argues that we need to add a developmental model to this in order to understand political change in America. White refers to the new levels as “higher keys” (as with musical notes). I refer to each new level as a worldview paradigm. Duckitt and Fisher (2003) define “worldviews” as individual's “beliefs about the nature of their social environments” (p. 201). I prefer the term “worldview” because it not only is used widely in integral theory, but also has recently seen common usage in popular American political dialogue. I use the term “paradigm” for reasons explained below.

I acknowledge that use of the term "paradigm" to describe worldviews may seem odd to some researchers and theorists, particularly because the way any given individual views the world at any particular time usually encompasses more than just one of these sets of belief. Further, individuals will draw upon differing worldviews according to the location of their predominant views along the various lines of development (to be explained later in this article).[16] Individuals may also vary their worldviews according to situational context. For example they may hold traditional views when it comes to their own homes and families, but modernist or postmodern views when it comes to their workplaces or government. The same is also true for tendencies that we can see across cultures and sub-cultural groups. Therefore, the use of worldview paradigm models to explain differences between political groups may seem like a gross over-simplification. However, it is also true that whichever worldview one draws on to make a value-judgment about any given occurrence or interaction, the notions found within that particular worldview tend, at least for that particular situation, to be considered as universal truth rather than as debatable assumption.

Anecdotal evidence suggests that when the basic tenants of a worldview paradigm are entrenched within cultural understandings and norms, it is difficult for individuals of that culture or sub-culture to fathom the reasoning behind any other view. If this notion about worldview paradigms is correct, the paradigms function in a way that is similar to the function of “mental models” (Jones et al, 2011). In fact, worldview paradigms could help to explain how and why mental models function the way that they do, in that "people tend to filter new information according to its congruence or otherwise with their existing understandings, beliefs, and values" (Jones et al, 2011). Individuals may not even realize that worldviews other than their own exist, which greatly limits their ability to understand or effectively communicate with others whose worldview paradigms are different. This produces frustration, particularly when people with conflicting values view each other as irrational or nonsensical.[17] When failing to recognize paradigmatic worldview differences, people may talk past one another, so that no one really hears or understands anyone else. This is why examination of a culture's predominant worldview paradigms is vital to an understanding of its shifts in law and custom and of the social and political dynamics which accompany those shifts.

---

[15] Explained in an email to me from McIntosh, received August 27, 2010.

[16] For example, an individual may express traditional views within the power distribution line of development but modernist views within the recognized authority line of development.

My Own Theory of Worldview "Paradigms" and "Cultural Lines of Development"

Loosely speaking, a paradigm may be defined as that which helps us make sense of the world around us. It is a set of general rules or guidelines that people use to interpret the world, sometimes on a subconscious or 'automatic' level. Thomas Kuhn (1962) used the term "paradigm" to refer to scientific understanding, but his ideas concerning the parameters of a paradigm lend well to an understanding of the function of worldviews. Kuhn tells us that when new discoveries disturb our old understandings, they cause a sort of chaos in the accepted paradigmatic frames. If the new discoveries cause too much chaos, that is, if they are too "far out" to be accepted by the larger culture of the time, they will be buried and forgotten. But if those discoveries are accurate, eventually they will be rediscovered. This means that, sooner or later, the paradigm engulfing the larger scientific community will fracture and expand into a larger one that allows for the reality of the previously shunned discoveries. This is how science, and our understanding of the physical world we live in, expands over time.

I posit that, similarly, the worldviews that construct the values which are at the very core of how we interpret, judge and interact with the vast world of information and life all around us (see Beck and Cowan, 1996;, McIntosh, 2007; Wilber, 1996) are paradigmic. Cultural worldviews within a given populace can shift, as they have done over the last few decades in the United States. As long as the older views are predominant, newer ways of seeing things will be suppressed. However, once a large enough section of the populace has begun to embrace the new ideas and values, laws and norms will begin to change (Williams, 1997). This, in turn, invites a push-back from those holding the old value sets, which creates a sort of chaos in the political system and in social networks. Eventually acceptance expands and the new worldviews become part of the overall norm. This would explain how societies change, and become more inclusive, over time.

Some theorists claim that worldviews develop and spread sequentially (Beck & Cowan, 1996; Brown & Riedy, 2006; McIntosh, 2007; Wilber, 1996). I argue that, at least within the

---

[17] That people with differing worldview paradigms may see each other's actions or ideas as nonsensical is evident in current American politics. For example, Mitt Romney said that Obama's plan to withdraw troops from Afghanistan "makes... no sense" (Boxer, 2012), Donald Trump said that Obama's speech about Libya made "no sense" (Reisner, 2011), and Obama said that the Republican blocking of his Cordray nomination made "no sense" (Brower and Runningen, 2011).

U.S., this certainly appears to have been true. When the United States was first established, most of the culture was centered in the traditional paradigm,[18] even though the founding fathers themselves promoted various elements of the modernist paradigm through their written ideas and in the Constitution they created. These modernist ideas had been gleaned from 17th and 18th century philosophers such as John Locke and Jean-Jacques Rousseau, and were written into the Declaration of Independence and the Constitution of the United States (see Locke, 1689/1993 and Rousseau, 1782/1998). Nonetheless, we did not see majority cultural embrace of the modernist paradigm within the United States of America until the twentieth century.[19] Finally, although tiny beginnings of the postmodern worldview paradigm began to appear before the modernist worldview took center stage in this country, it did not enjoy significant cultural expression until the 1960s (Wilber, 1995, 1996).

Theorists also stress that the developmental change of worldview paradigms is not rigid or exactly linear (see Wilber, 2006; McIntosh, 2007). Instead, it is fluid, more like waves than straight lines (Wilber, 2006), particularly as views and sentiments shift back and forth with various social and political stressors, such as emergencies and perceived threats. Also, the elements of a given worldview paradigm change as they bridge across to new worldview paradigms unfolding within the culture. These changing elements are called “lines of development” (Esbjörn-Hargens, 2009; Wilber, 1995, 1996) because they exhibit growth and change across time which, on average, tends to be in a particular direction. I prefer to use this “lines” of development terminology rather than the term “domains” of development as is often used in academic literature about child development. This is because I believe “lines” is a better descriptor for what I am attempting to explain. Anna Freud (1966–1980) used the term “lines of development” to describe six areas of developmental progression that occur from infancy to adulthood. These lines occur within, and thread through, the cognitive and social/emotional developmental domains. Similarly, worldview developmental lines occur within, and thread through, worldview domains, such as political ideology, sustainability awareness, and so forth. I borrow the worldview descriptions from other writers, as I have shown. Charting these lines, and explaining their political attributes and some of their social manifestations, is my unique contribution to this field. Charting them allows for clarity and, perhaps more importantly, allows us to determine their healthy and unhealthy attributes and manifestations, as I will explain later.

A culture’s average paradigmic worldview across multiple developmental lines can be called its “center of gravity.”[20] Although individual viewpoints vary widely across issues, I nonetheless argue that, currently, the majority of Americans can be classified as cultural “modernists,” and the current paradigmic worldview “center of gravity” for the U.S. is also “modernist.” I reach this conclusion by identifying some of the theorist-described elements of the modernist paradigm within the majority's dialectical frames and cultural narratives, as demonstrated below. However, even an individual who can be classified as a cultural modernist is likely to also have some views and values that are either traditional or postmodern, as the views of few individuals today are completely grounded in only one worldview paradigm.

---

[18] This is why, for example, the founding fathers were unable to abolish slavery, which was still accepted within the traditional paradigm at that time.

[19] Among other things, the abolition of slavery and subsequent push for equal rights for blacks, the industrial revolution, women’s enfranchisement, increased educational levels, and the ever-expanding influence of technology in the lives of common people combined over time to increase the embrace of the modernist paradigm.

[20] An individual’s “center of gravity,” as coined by Wilber, is the average level of attainment across identifiable developmental lines. Cultures also have developmental “centers of gravity,” as can be identified by majority worldviews held across multiple lines of cultural development (Wilber, *Sex, ecology, spirituality,* 1995).

The Developmental Lines

Because both cultures and individuals have multiple lines of development, they are likely to be at different stages on different lines simultaneously. Also, in spite of seemingly closed-system, paradigm-like qualities, no worldview value-system stands alone or untouched by others, particularly in the contemporary United States with its wide cultural diversity. Therefore, a group whose worldview center of gravity is modernist may nonetheless espouse collective traditional or postmodern views on some topics. This phenomenon is additionally complicated by the fact that cultural worldview paradigms are constantly, if slowly, shifting.[21] However, it is possible to make some sense of this complication. Making use of well-established theoretical descriptions of each of the aforementioned worldviews (see, for example, Beck and Cowan, 1996; Esbjörn-Hargens, 2009; McIntosh, 2007; and Wilber, multiple publications), I identify five lines of cultural worldview development. I have labeled these five lines of development the "social receptivity" line, the "power distribution" line, the "religious/spirituality" line, the "recognized authority" line and the "science/discovery" line. For simplicity's sake, I discuss only five lines of cultural worldview development as they appear across the three worldview paradigms predominant within the United States today. These explanations are not intended to stereotype individuals or groups, but rather to explain how worldview paradigms align with and complicate socio-political movements, cultural norms and individual perception of each. The labels of the lines are mine, and are intended only to be simplistic descriptors of the types of change that we see across time within each line.

Once the defining elements of these lines, as they bridge across the three worldviews, are demarcated, they can be traced within populations by noticing expressed and implied perceptions of reality, notions concerning how government should work, and views about how we should live. This exercise can do much to explain the identifiable changes in law and cultural attitude about marriage that have appeared as the nation's worldview center of gravity has shifted, as well as the ensuing cultural clashes and individual confusions. For example, using this nuanced understanding of paradigmic worldview perception, we can see that it was the traditional worldview paradigm that produced earlier marriage and dating norms and laws, and the changes over the last century have corresponded with a cultural worldview shift, first into the modernist paradigm, and then towards postmodernism. Cultural strongholds of traditionalism still exist in the U.S., at somewhere between 20 and 35 percent of the population.[22] This is likely why there is always political push-back against so-called “progressive” or “liberal” ideals which are mostly forwarded by postmoderns. Although a relatively small percentage of the population,[23] it is predominantly postmoderns who forward and embrace the newest laws and norms, such as legal acceptance of gay marriage and cultural acceptance of the gay lifestyle.

---

[21] Paradigmic shifts in the population are difficult to demonstrate empirically, in part because change occurs relatively slowly, and in part due to a lack of survey data utilizing questions which could accurately measure these. Nonetheless, we can observe gradual, long term trends, as discussed throughout this paper.

[22] For example, religious fundamentalism and biblical literalism, hallmarks of traditionalism (religious-spirituality line of development) remained constant from 1996 to 2000 at approximately 22 or 23 percent of the U.S. population. Surveys in 2004 and 2005 place this number somewhere between 20 and 37

Note that when I refer to the “tendencies” of any worldview group, it is not my intent to stereotype the group or to suggest that all “postmoderns,” for example, would follow those tendencies. The generalizations are intended to broadly describe the worldviews in keeping with the way that other theorists have described them, and to simplify understanding of each worldview paradigm. I acknowledge that actual views of individuals vary widely. But it is also helpful to understand that when, for example, a self-described “modernist” disagrees with a particular description of a “modernist” paradigmic view, what this actually means is that the individual does not actually hold what is the most common “modernist” view on the subject in question. It may be that the individual has some variation of the modernist view, or may instead mean that the individual actually holds a traditional or postmodern view on that particular subject.

The Social Receptivity Line of Development

Scrutiny of the “social receptivity” line of development reveals that the traditional paradigm is communal, but the focus of that communalism tends to be relatively small. Care for one’s family and one’s neighbor is of paramount importance, but full acceptance of others tends to be limited to one’s own family and neighbors, or to the members of one’s church or religious community. Loving families and peaceful neighborhoods are healthy expressions of traditionalism. Unfortunately, the same social norms which ensure the functional mechanisms of these families and neighborhoods can have unintentional side-effects, such as ethnocentrism, intolerance, and racism. This is partly because traditionalist groups tend to use the threat of being humiliated, shunned or ostracized as coercion to ensure that most individuals within the culture will follow the accepted set of rules and norms. Once this threat is imbedded within a culture, individuals born into the culture may fear being perceived as different or, as they mature into adulthood, as failing to completely and properly assimilate with the culture. These fears are then projected onto to others, and become the basis for gossip, shunning, and even violence against

---

percent, depending on how questions are phrased and how combined question results are interpreted (see Alwin, et al, “Measuring religious identities in surveys,” 2006, and Hoffmann and Bartkowski, “Gender, religious tradition and biblical literalism,” 2008). Also, a percentage of people who tend to be largely intolerant of people perceived to be very different from themselves has remained fairly constant for awhile at between 25 and 33 percent (traditionalism, social receptivity line of development). See Schafer and Shaw, “Trends: Tolerance in the United States,” 2009.

[23] In 2010 and 2011, between 18 and 22 percent of Americans considered themselves to be either “liberal” or “progressive,” political values which somewhat align with postmodernism (see “Doing what works survey,” 2010, and “CNN/Opinion research corporation poll,” 2011, both retrieved from the Roper Center for Public Opinion Research’s ipoll databank). However, these numbers may be slightly depressed due to the negative connotations that have been attached to these terms in recent decades. Interestingly, in 2008, 24 percent of Americans said that they would be more likely to vote for a presidential candidate who celebrates the wide diversity of Americans than one who celebrates the shared values of Americans. This also is likely a reflection of postmodern values (social receptivity line). See “FOX News/Opinion dynamics poll,” 2008, retrieved from the Roper Center for Public Opinion Research’s ipoll databank.

anyone labeled as "different." Concepts of "good" versus "bad" behaviors can evolve into perception of an "us" versus "them" conflict. "We" are the ones who adhere to particular social expectations, and "they" are the ones who do not. To make matters worse, expectations concerning physical appearances can be tangled into the mix, such that those who look "like us," have the same skin color as "us," dress "like us," or wear their hair the way "we" do are seen as "good," and those who are different in some way are labeled as "bad."

We can also see this ethnocentricism in the "us against them" attitude that surfaces any time resources appear to be scarce. For example, when employment opportunities in the U.S. appear to be scarce, traditionalists tend to blame recent immigrants, especially illegal immigrants, because these "others" are easily perceived as "not us" and therefore in competition against "us" for the limited resources. Another example of cultural ethnocentrism's response to perceived scarcity is the hording of rights by power-elite groups. This occurs because of a perceived scarcity of rights, which is in part created by a belief in "natural and necessary"[24] hierarchy. This notion of "natural and necessary" hierarchy occurs within the "power distribution" line of development at the traditionalism juncture. The result is that those traditionalists who are at the powerful top of a legal or social hierarchy tend to believe that the granting of rights to other groups must mean the taking of rights from the currently powerful, because they believe that no two groups can ever really equally coexist.[25] This reinforces the "us against them" attitude so often seen in the "social receptivity" line of development at the traditionalism stage (Table 2). Fortunately, these tendencies lessen as later worldview paradigms emerge. Also, such problems do not *necessarily* manifest within traditionalism. Rather, these are unhealthy aspects which have a potential to manifest, and which, unfortunately, often do.

Table 2. Social receptivity line of development – Traditional paradigm juncture

	Healthy aspects	**Possible unhealthy manifestations**
Family	Individuals are attentive to family members; family relations are considered a priority over other aspects of life.	Individuals within family may be controlling of one another. For women, relationships and goals or work beyond caring for family may be denied.
Community	Individuals are taught to be strongly community oriented and to care about their neighbors.	One's own community or group may be considered to be superior to others, causing racism and ethnocentrism.
Socialization	Norms and expectations taught to children include items intended to ensure family and community well-being: honesty, trust, kindness, care-giving, sharing, respect, etc.	Those who do not adhere to expected roles may be branded as evil and ostracized. Possible phobia of those who are "different," such as homophobia.

---

[24] This notion of natural and necessary hierarchy was perhaps first documented in Aristotle's Politics.

[25] I discuss this concept more fully under the "Power distribution line of development," section of this article.

The modernist paradigm, on the other hand, tends to forward toleration as a social good or patriotic duty within democratic societies which are multicultural, multiracial and multi-religious. Toleration for difference is emphasized, but to varying degrees according to one's distance from traditionalism. Whereas traditionalism tends to shun differences rather than to accept them, modernism sees its toleration as a reason for pride. In fact, some modernist philosophy stakes out toleration as the only basis for peace and democracy (for example, see Rawls, 1971 and Popper, 1945).

The modernist paradigm is also highly individualistically focused (Table 3). This seems to explain why one argument that feminism has had with traditionalism is that, in the name of "taking care of the family," women could be coerced into forsaking their own goals and individuality. The difficulty for women was that they were the expected caretakers of their children and of the home (Baer, 1999), and this role, coupled with their exclusion from the public realm, placed them largely into dependency upon males and left them unable to pursue *meaningful choices of their own.*

Table 3. Social receptivity line of development – Modernist paradigm juncture

	Healthy aspects	**Possible unhealthy manifestations**
Family	Individuality of all family members is respected. All individuals are allowed to seek their own goals and happiness.	Hyper-individualism can manifest, wherein family and close ties are forsaken as being "too much responsibility"
Community	Democratic and tolerant of differences.	Common good can be forgotten in the pursuit of personal desires.
Socialization	Personal strength and care of oneself is emphasized. Children are taught to believe in and stand up for themselves, and to seek out the realization of their own dreams and goals.	Traditionalism's integrity, trust and honesty can be lost if individuals are taught to always "look out for number one" and to be wary of the motives of others.

Postmodernism, on the other hand, brings a return to communalism, but as large-group, or global, communalism (Beck & Cowan, 1996; McIntosh, 2007). A shift into the postmodern paradigm means that individualism can be once again dampened, this time in deference to a greater common good. For example, in the U.S., postmodern liberals and progressives, likely because they tend to think in global terms, tend to favor governmental regulation of business which can guarantee consumer safety and the preservation of the natural environment. For the same reason, they tend to believe in universal healthcare and free higher education for all. They also tend to be concerned with the well-being of individuals all around the globe (for example, see Lakoff, 2002).

Postmoderns in the U.S. also tend to push for *group* rights beyond what modernists are generally ready to extend (Table 4). For example, "Affirmative Action"[26] is a postmodern concept, in that it seeks to promote the well-being of minority groups, which is also why modernists tend to dislike it. People whose values are centered in the modernist paradigm tend, instead, to see "Affirmative Action" as an affront to *individual* effort and merit. Further, toleration, as it is usually defined, is fairly unique to the modernist paradigm. Individuals embracing the postmodern paradigm can be offended by the notion of "toleration,"[27] as it suggests that something or someone is not liked, but nonetheless must be "put up with." Postmodernism instead tends to embrace diversity as a universal good and much needed commodity (Beck & Cowan, 1999; McIntosh, 2007). It is also from postmodernism that we get "politically correct" language, which is encouraged so as to avoid demeaning other individuals and groups.

Table 4. Social receptivity line of development – Postmodern paradigm juncture

	Healthy aspects	**Possible unhealthy manifestations**
Family	Embracing of the "global village" concept, postmoderns seek to eradicate poverty, world hunger and discrimination against all groups worldwide.	Can unintentionally suppress individual drive. Postmodernists can also sometimes forget to take care of those closest to themselves or may engage in extreme self-sacrifice.
Community	Embracing of diversity as a social good. There is a tendency to revel in individual and group differences as life-enriching.	Can be *extremely* relativistic, refusing to *evaluate* customs, behaviors or claims.
Socialization	Children are taught to be accepting and embracing of others regardless of differences. Sharing, giving, and care-giving are once again emphasized.	The modernist paradigm's individualism can be lost if *too* much emphasis is again placed on communal efforts.

The Power Distribution Line of Development

The power distribution line of development at the traditional juncture reveals an interesting phenomenon. Here there is a strong although arguably false perception that there is among humans a *scarcity of rights*, which manifests repeatedly throughout American history. For example, when women were struggling to gain the right to vote, a common fear-based argument emphasized by some men was that if women gained the right to vote, men would lose their political power. John Adams told his wife Abigail that women should not have the right to vote because if they did, men would be subject to "the despotism of the petticoat."[28] In other words, if women were allowed to vote, they would end up with total rule over men. This suggests a notion that it is impossible for men and women to have equal political power. Adams appears to have assumed that either men could have political power or women could, but that both could not have it at the same time. Similarly, white men historically argued that blacks should not be given rights equal to their own because, given some measure of political power, blacks would "take over the country."[29] Heterosexuals have likewise been guilty of arguing that if homosexuals are given the right to legally marry, heterosexual married couples will somehow lose their own political and social power.[30]

---

[26] "Affirmative action" refers to deliberate attempts to increase the representation of minorities in employment, education, and business (see the *Stanford encyclopedia of philosophy*, 2009).

[27] See discussion of types of toleration in Walzer's *On toleration*, 1997.

[28] John Adams said this in spite of being marginally tolerant of his wife's feminist views. See his letter to Abigail, dated March 31, 1776.
